  Message: Prepared statement contains no metadata

- Error: 2053 (CR_NO_RESULT_SET [4001])

  Message: Attempt to read a row while there is no result set associated with the statement

- Error: 2054 (CR_NOT_IMPLEMENTED [4001])

  Message: This feature is not implemented yet

- Error: 2055 (CR_SERVER_LOST_EXTENDED [4001])

  Message: Lost connection to MySQL server at '%s', system error: %d

- Error: 2056 (CR_STMT_CLOSED [4001])

  Message: Statement closed indirectly because of a preceeding %s() call

- Error: 2057 (CR_NEW_STMT_METADATA [4001])

  Message: The number of columns in the result set differs from the number of bound buffers. You must reset the statement, rebind the result set columns, and execute the statement again

Problems and Common Errors

This section lists some common problems and error messages that you may encounter. It describes how to determine the causes of the problems and what to do to solve them.

How to Determine What Is Causing a Problem

When you run into a problem, the first thing you should do is to find out which program or piece of equipment is causing it:

- If you have one of the following symptoms, then it is probably a hardware problems (such as memory, motherboard, CPU, or hard disk) or kernel problem:
  - The keyboard does not work. This can normally be checked by pressing the Caps Lock key. If the Caps Lock light does not change, you have to replace your keyboard. (Before doing this, you should try to restart your computer and check all cables to the keyboard.)
  - The mouse pointer does not move.
  - The machine does not answer to a remote machine's pings.
  - Other programs that are not related to MySQL do not behave correctly.
  - Your system restarted unexpectedly. (A faulty user-level program should never be able to take down your system.)

In this case, you should start by checking all your cables and run some diagnostic tool to check your hardware! You should also check whether there are any patches, updates, or service packs for your operating system that could likely solve your problem. Check also that all your libraries (such as `glibc`) are up to date.

It is always good to use a machine with ECC memory to discover memory problems early.

- If your keyboard is locked up, you may be able to recover by logging in to your machine from another machine and executing `kbd_mode -a`.
- Please examine your system log file (`/var/log/messages` or similar) for reasons for your problem. If you think the problem is in MySQL, you should also examine MySQL's log files. See MySQL Server Logs.
- If you do not think you have hardware problems, you should try to find out which program is causing problems. Try using `top`, `ps`, Task Manager, or some similar program, to check which program is taking all CPU or is locking the machine.
- Use `top`, `df`, or a similar program to check whether you are out of memory, disk space, file descriptors, or some other critical resource.
- If the problem is some runaway process, you can always try to kill it. If it does not want to die, there is probably a bug in the operating system.

If after you have examined all other possibilities and you have concluded that the MySQL server or a MySQL client is causing the problem, it is time to create a bug report for our mailing list or our support team. In the bug report, try to give a very detailed description of how the system is behaving and what you think is happening. You should also state why you think that MySQL is causing the problem. Take into consideration all the situations in this chapter. State any problems exactly how they appear when you examine your system. Use the “copy and paste” method for any output and error messages from programs and log files.

Try to describe in detail which program is not working and all symptoms you see. We have in the past received many bug reports that state only “the system does not work.” This provides us with no information about what could be the problem.

If a program fails, it is always useful to know the following information:

- Has the program in question made a segmentation fault (did it dump core)?
- Is the program taking up all available CPU time? Check with `top`. Let the program run for a while, it may simply be evaluating something computationally intensive.
- If the `mysqld` server is causing problems, can you get any response from it with `mysqladmin -u root ping` or `mysqladmin -u root processlist`?
- What does a client program say when you try to connect to the MySQL server? (Try with `mysql`, for example.) Does the client jam? Do you get any output from the program?

When sending a bug report, you should follow the outline described in How to Report Bugs or Problems.

Common Errors When Using MySQL Programs

This section lists some errors that users frequently encounter when running MySQL programs. Although the problems show up when you try to run client programs, the solutions to many of the problems involves changing the configuration of the MySQL server.

`Access denied`

An `Access denied` error can have many causes. Often the problem is related to the MySQL accounts that the server permits client programs to use when connecting. See The MySQL Access Privilege System, and Causes of Access-Denied Errors.

Can't connect to [local] MySQL server

A MySQL client on Unix can connect to the `mysqld` server in two different ways: By using a Unix socket file to connect through a file in the file system (default `/tmp/mysql.sock`), or by using TCP/IP, which connects through a port number. A Unix socket file connection is faster than TCP/IP, but can be used only when connecting to a server on the same computer. A Unix socket file is used if you do not specify a host name or if you specify the special host name `localhost`.

If the MySQL server is running on Windows, you can connect using TCP/IP. If the server is started with the `--enable-named-pipe` [426] option, you can also connect with named pipes if you run the client on the host where the server is running. The name of the named pipe is `MySQL` by default. If you do not give a host name when connecting to `mysqld`, a MySQL client first tries to connect to the named pipe. If that does not work, it connects to the TCP/IP port. You can force the use of named pipes on Windows by using `.` as the host name.

The error (2002) `Can't connect to ...` normally means that there is no MySQL server running on the system or that you are using an incorrect Unix socket file name or TCP/IP port number when trying to connect to the server. You should also check that the TCP/IP port you are using has not been blocked by a firewall or port blocking service.

The error (2003) `Can't connect to MySQL server on 'server' (10061)` indicates that the network connection has been refused. You should check that there is a MySQL server running, that it has network connections enabled, and that the network port you specified is the one configured on the server.

Start by checking whether there is a process named `mysqld` running on your server host. (Use `ps xa | grep mysqld` on Unix or the Task Manager on Windows.) If there is no such process, you should start the server. See Starting and Troubleshooting the MySQL Server.

If a `mysqld` process is running, you can check it by trying the following commands. The port number or Unix socket file name might be different in your setup. `host_ip` represents the IP address of the machine where the server is running.

```
shell> mysqladmin version
shell> mysqladmin variables
shell> mysqladmin -h `hostname` version variables
shell> mysqladmin -h `hostname` --port=3306 version
shell> mysqladmin -h host_ip version
shell> mysqladmin --protocol=SOCKET --socket=/tmp/mysql.sock version
```

Note the use of backticks rather than forward quotation marks with the `hostname` command; these cause the output of `hostname` (that is, the current host name) to be substituted into the `mysqladmin` command. If you have no `hostname` command or are running on Windows, you can manually type the host name of your machine (without backticks) following the `-h` option. You can also try `-h 127.0.0.1` to connect with TCP/IP to the local host.

Make sure that the server has not been configured to ignore network connections or (if you are attempting to connect remotely) that it has not been configured to listen only locally on its network interfaces. If the server was started with `--skip-networking` [443], it will not accept TCP/IP connections at all. If the server was started with `--bind-address=127.0.0.1` [419], it will listen for TCP/IP connections only locally on the loopback interface and will not accept remote connections.

Check to make sure that there is no firewall blocking access to MySQL. Your firewall may be configured on the basis of the application being executed, or the port number used by MySQL for communication (3306 by default). Under Linux or Unix, check your IP tables (or similar) configuration to ensure that the port has not been blocked. Under Windows, applications such as ZoneAlarm or the Windows XP personal firewall may need to be configured not to block the MySQL port.

Here are some reasons the `Can't connect to local MySQL server` error might occur:

- `mysqld` is not running on the local host. Check your operating system's process list to ensure the `mysqld` process is present.
- You're running a MySQL server on Windows with many TCP/IP connections to it. If you're experiencing that quite often your clients get that error, you can find a workaround here: `Connection to MySQL Server Failing on Windows`.
- Someone has removed the Unix socket file that `mysqld` uses (`/tmp/mysql.sock` by default). For example, you might have a `cron` job that removes old files from the `/tmp` directory. You can always run `mysqladmin version` to check whether the Unix socket file that `mysqladmin` is trying to use really exists. The fix in this case is to change the `cron` job to not remove `mysql.sock` or to place the socket file somewhere else. See How to Protect or Change the MySQL Unix Socket File.
- You have started the `mysqld` server with the `--socket=/path/to/socket` [445] option, but forgotten to tell client programs the new name of the socket file. If you change the socket path name for the server, you must also notify the MySQL clients. You can do this by providing the same `--socket` [226] option when you run client programs. You also need to ensure that clients have permission to access the `mysql.sock` file. To find out where the socket file is, you can do:

  ```
  shell> netstat -ln | grep mysql
  ```

  See How to Protect or Change the MySQL Unix Socket File.
- You are using Linux and one server thread has died (dumped core). In this case, you must kill the other `mysqld` threads (for example, with `kill` or with the `mysql_zap` script) before you can restart the MySQL server. See What to Do If MySQL Keeps Crashing.
- The server or client program might not have the proper access privileges for the directory that holds the Unix socket file or the socket file itself. In this case, you must either change the access privileges for the directory or socket file so that the server and clients can access them, or restart `mysqld` with a `--socket` [445] option that specifies a socket file name in a directory where the server can create it and where client programs can access it.

If you get the error message `Can't connect to MySQL server on some_host`, you can try the following things to find out what the problem is:

- Check whether the server is running on that host by executing `telnet some_host 3306` and pressing the Enter key a couple of times. (3306 is the default MySQL port number. Change the value if your server is listening to a different port.) If there is a MySQL server running and listening to the port, you should get a response that includes the server's version number. If you get an error such as `telnet: Unable to connect to remote host: Connection refused`, then there is no server running on the given port.
- If the server is running on the local host, try using `mysqladmin -h localhost variables` to connect using the Unix socket file. Verify the TCP/IP port number that the server is configured to listen to (it is the value of the `port` [510] variable.)
- If you are running under Linux and Security-Enhanced Linux (SELinux) is enabled, make sure you have disabled SELinux protection for the `mysqld` process.

Connection to MySQL Server Failing on Windows

When you're running a MySQL server on Windows with many TCP/IP connections to it, and you're experiencing that quite often your clients get a `Can't connect to MySQL server` error, the reason might be that Windows does not allow for enough ephemeral (short-lived) ports to serve those connections.

The purpose of `TIME_WAIT` is to keep a connection accepting packets even after the connection has been closed. This is because Internet routing can cause a packet to take a slow route to its destination

and it may arrive after both sides have agreed to close. If the port is in use for a new connection, that packet from the old connection could break the protocol or compromise personal information from the original connection. The `TIME_WAIT` delay prevents this by ensuring that the port cannot be reused until after some time has been permitted for those delayed packets to arrive.

It is safe to reduce `TIME_WAIT` greatly on LAN connections because there is little chance of packets arriving at very long delays, as they could through the Internet with its comparatively large distances and latencies.

Windows permits ephemeral (short-lived) TCP ports to the user. After any port is closed it will remain in a `TIME_WAIT` status for 120 seconds. The port will not be available again until this time expires. The default range of port numbers depends on the version of Windows, with a more limited number of ports in older versions:

- Windows through Server 2003: Ports in range 1025–5000
- Windows Vista, Server 2008, and newer: Ports in range 49152–65535

With a small stack of available TCP ports (5000) and a high number of TCP ports being open and closed over a short period of time along with the `TIME_WAIT` status you have a good chance for running out of ports. There are two ways to address this problem:

- Reduce the number of TCP ports consumed quickly by investigating connection pooling or persistent connections where possible
- Tune some settings in the Windows registry (see below)

IMPORTANT: The following procedure involves modifying the Windows registry. Before you modify the registry, make sure to back it up and make sure that you understand how to restore the registry if a problem occurs. For information about how to back up, restore, and edit the registry, view the following article in the Microsoft Knowledge Base: http://support.microsoft.com/kb/256986/EN-US/.

1. Start Registry Editor (`Regedt32.exe`).
2. Locate the following key in the registry:

   ```
   HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters
   ```

3. On the `Edit` menu, click `Add Value`, and then add the following registry value:

   ```
   Value Name: MaxUserPort
   Data Type: REG_DWORD
   Value: 65534
   ```

   This sets the number of ephemeral ports available to any user. The valid range is between 5000 and 65534 (decimal). The default value is 0x1388 (5000 decimal).

4. On the `Edit` menu, click `Add Value`, and then add the following registry value:

   ```
   Value Name: TcpTimedWaitDelay
   Data Type: REG_DWORD
   Value: 30
   ```

   This sets the number of seconds to hold a TCP port connection in `TIME_WAIT` state before closing. The valid range is between 0 (zero) and 300 (decimal). The default value is 0x78 (120 decimal).

5. Quit Registry Editor.
6. Reboot the machine.

Note: Undoing the above should be as simple as deleting the registry entries you've created.

Lost connection to MySQL server

There are three likely causes for this error message.

Usually it indicates network connectivity trouble and you should check the condition of your network if this error occurs frequently. If the error message includes “during query,” this is probably the case you are experiencing.

Sometimes the “during query” form happens when millions of rows are being sent as part of one or more queries. If you know that this is happening, you should try increasing `net_read_timeout` [505] from its default of 30 seconds to 60 seconds or longer, sufficient for the data transfer to complete.

More rarely, it can happen when the client is attempting the initial connection to the server. In this case, if your `connect_timeout` [468] value is set to only a few seconds, you may be able to resolve the problem by increasing it to ten seconds, perhaps more if you have a very long distance or slow connection. You can determine whether you are experiencing this more uncommon cause by using `SHOW GLOBAL STATUS LIKE 'Aborted_connects'`. It will increase by one for each initial connection attempt that the server aborts. You may see “reading authorization packet” as part of the error message; if so, that also suggests that this is the solution that you need.

If the cause is none of those just described, you may be experiencing a problem with `BLOB` values that are larger than `max_allowed_packet` [493], which can cause this error with some clients. Sometime you may see “packet too large” as part of the error message, and that confirms that you need to increase `max_allowed_packet` [493].

Client does not support authentication protocol

MySQL 5.1 uses an authentication protocol based on a password hashing algorithm that is incompatible with that used by older (pre-4.1) clients. If you upgrade the server from 4.0, attempts to connect to it with an older client may fail with the following message:

```
shell> mysql
Client does not support authentication protocol requested
by server; consider upgrading MySQL client
```

To solve this problem, you should use one of the following approaches:

- Upgrade all client programs to use a 4.1.1 or newer client library.
- When connecting to the server with a pre-4.1 client program, use an account that still has a pre-4.1-style password.
- Reset the password to pre-4.1 style for each user that needs to use a pre-4.1 client program. This can be done using the `SET PASSWORD` statement and the `OLD_PASSWORD()` [1030] function:

  ```
  mysql> SET PASSWORD FOR
      -> 'some_user'@'some_host' = OLD_PASSWORD('newpwd');
  ```

  Alternatively, use `UPDATE` and `FLUSH PRIVILEGES`:

  ```
  mysql> UPDATE mysql.user SET Password = OLD_PASSWORD('newpwd')
      -> WHERE Host = 'some_host' AND User = 'some_user';
  mysql> FLUSH PRIVILEGES;
  ```

  Substitute the password you want to use for “*newpwd*” in the preceding examples. MySQL cannot tell you what the original password was, so you'll need to pick a new one.

- Tell the server to use the older password hashing algorithm:

  1. Start `mysqld` with the `old_passwords` [508] system variable set to 1.
  2. Assign an old-format password to each account that has had its password updated to the longer 4.1 format. You can identify these accounts with the following query:

     ```
     mysql> SELECT Host, User, Password FROM mysql.user
     ```

```
    -> WHERE LENGTH(Password) > 16;
```

For each account record displayed by the query, use the `Host` and `User` values and assign a password using the `OLD_PASSWORD()` [1030] function and either `SET PASSWORD` or `UPDATE`, as described earlier.

Note

In older versions of PHP, the `mysql` extension does not support the authentication protocol in MySQL 4.1.1 and higher. This is true regardless of the PHP version being used. If you wish to use the `mysql` extension with MySQL 4.1 or newer, you may need to follow one of the options discussed above for configuring MySQL to work with old clients. The `mysqli` extension (stands for "MySQL, Improved"; added in PHP 5) is compatible with the improved password hashing employed in MySQL 4.1 and higher, and no special configuration of MySQL need be done to use this MySQL client library. For more information about the `mysqli` extension, see http://php.net/mysqli.

It may also be possible to compile the older `mysql` extension against the new MySQL client library. This is beyond the scope of this Manual; consult the PHP documentation for more information. You also be able to obtain assistance with these issues in our MySQL with PHP forum.

For additional background on password hashing and authentication, see Password Hashing in MySQL.

Password Fails When Entered Interactively

MySQL client programs prompt for a password when invoked with a `--password` [225] or `-p` option that has no following password value:

```
shell> mysql -u user_name -p
Enter password:
```

On some systems, you may find that your password works when specified in an option file or on the command line, but not when you enter it interactively at the `Enter password:` prompt. This occurs when the library provided by the system to read passwords limits password values to a small number of characters (typically eight). That is a problem with the system library, not with MySQL. To work around it, change your MySQL password to a value that is eight or fewer characters long, or put your password in an option file.

Host '*host_name*' is blocked

If the following error occurs, it means that `mysqld` has received many connection requests from the given host that were interrupted in the middle:

```
Host 'host_name' is blocked because of many connection errors.
Unblock with 'mysqladmin flush-hosts'
```

The value of the `max_connect_errors` [493] system variable determines how many successive interrupted connection requests are permitted. (See Server System Variables.) After `max_connect_errors` [493] failed requests without a successful connection, `mysqld` assumes that something is wrong (for example, that someone is trying to break in), and blocks the host from further connections until you issue a `FLUSH HOSTS` statement or execute a `mysqladmin flush-hosts` command.

By default, `mysqld` blocks a host after 10 connection errors. You can adjust the value by setting `max_connect_errors` [493] at server startup:

```
shell> mysqld_safe --max_connect_errors=10000 &
```

The value can also be set at runtime:

```
mysql> SET GLOBAL max_connect_errors=10000;
```

If you get the `Host 'host_name' is blocked` error message for a given host, you should first verify that there is nothing wrong with TCP/IP connections from that host. If you are having network problems, it does you no good to increase the value of the `max_connect_errors` [493] variable.

Too many connections

If you get a `Too many connections` error when you try to connect to the `mysqld` server, this means that all available connections are in use by other clients.

The number of connections permitted is controlled by the `max_connections` [493] system variable. Beginning with MySQL 5.1.15, its default value is 151 to improve performance when MySQL is used with the Apache Web server. (Previously, the default was 100.) If you need to support more connections, you should set a larger value for this variable.

`mysqld` actually permits `max_connections+1` [493] clients to connect. The extra connection is reserved for use by accounts that have the `SUPER` [628] privilege. By granting the `SUPER` [628] privilege to administrators and not to normal users (who should not need it), an administrator can connect to the server and use `SHOW PROCESSLIST` to diagnose problems even if the maximum number of unprivileged clients are connected. See `SHOW PROCESSLIST` Syntax.

The maximum number of connections MySQL can support depends on the quality of the thread library on a given platform, the amount of RAM available, how much RAM is used for each connection, the workload from each connection, and the desired response time. Linux or Solaris should be able to support at 500 to 1000 simultaneous connections routinely and as many as 10,000 connections if you have many gigabytes of RAM available and the workload from each is low or the response time target undemanding. Windows is limited to (open tables × 2 + open connections) < 2048 due to the Posix compatibility layer used on that platform.

Increasing `open-files-limit` [438] may be necessary. Also see Installing MySQL on Linux, for how to raise the operating system limit on how many handles can be used by MySQL.

Out of memory

If you issue a query using the `mysql` client program and receive an error like the following one, it means that `mysql` does not have enough memory to store the entire query result:

```
mysql: Out of memory at line 42, 'malloc.c'
mysql: needed 8136 byte (8k), memory in use: 12481367 bytes (12189k)
ERROR 2008: MySQL client ran out of memory
```

To remedy the problem, first check whether your query is correct. Is it reasonable that it should return so many rows? If not, correct the query and try again. Otherwise, you can invoke `mysql` with the `--quick` [264] option. This causes it to use the `mysql_use_result()` C API function to retrieve the result set, which places less of a load on the client (but more on the server).

MySQL server has gone away

This section also covers the related `Lost connection to server during query` error.

The most common reason for the `MySQL server has gone away` error is that the server timed out and closed the connection. In this case, you normally get one of the following error codes (which one you get is operating system-dependent).

Error Code	Description
`CR_SERVER_GONE_ERROR` [3998]	The client couldn't send a question to the server.
`CR_SERVER_LOST` [3998]	The client didn't get an error when writing to the server, but it didn't get a full answer (or any answer) to the question.

By default, the server closes the connection after eight hours if nothing has happened. You can change the time limit by setting the `wait_timeout` [538] variable when you start `mysqld`. See Server System Variables.

If you have a script, you just have to issue the query again for the client to do an automatic reconnection. This assumes that you have automatic reconnection in the client enabled (which is the default for the `mysql` command-line client).

Some other common reasons for the `MySQL server has gone away` error are:

- You (or the db administrator) has killed the running thread with a `KILL` statement or a `mysqladmin kill` command.
- You tried to run a query after closing the connection to the server. This indicates a logic error in the application that should be corrected.
- A client application running on a different host does not have the necessary privileges to connect to the MySQL server from that host.
- You got a timeout from the TCP/IP connection on the client side. This may happen if you have been using the commands: `mysql_options(..., MYSQL_OPT_READ_TIMEOUT,...)` or `mysql_options(..., MYSQL_OPT_WRITE_TIMEOUT,...)`. In this case increasing the timeout may help solve the problem.
- You have encountered a timeout on the server side and the automatic reconnection in the client is disabled (the `reconnect` flag in the `MYSQL` structure is equal to 0).
- You are using a Windows client and the server had dropped the connection (probably because `wait_timeout` [538] expired) before the command was issued.

  The problem on Windows is that in some cases MySQL does not get an error from the OS when writing to the TCP/IP connection to the server, but instead gets the error when trying to read the answer from the connection.

  Prior to MySQL 5.1.8, even if the `reconnect` flag in the `MYSQL` structure is equal to 1, MySQL does not automatically reconnect and re-issue the query as it doesn't know if the server did get the original query or not.

  The solution to this is to either do a `mysql_ping()` on the connection if there has been a long time since the last query (this is what Connector/ODBC does) or set `wait_timeout` [538] on the `mysqld` server so high that it in practice never times out.
- You can also get these errors if you send a query to the server that is incorrect or too large. If `mysqld` receives a packet that is too large or out of order, it assumes that something has gone wrong with the client and closes the connection. If you need big queries (for example, if you are working with big `BLOB` columns), you can increase the query limit by setting the server's `max_allowed_packet` [493] variable, which has a default value of 1MB. You may also need to increase the maximum packet size on the client end. More information on setting the packet size is given in `Packet too large`.

  An `INSERT` or `REPLACE` statement that inserts a great many rows can also cause these sorts of errors. Either one of these statements sends a single request to the server irrespective of the number of rows to be inserted; thus, you can often avoid the error by reducing the number of rows sent per `INSERT` or `REPLACE`.
- You also get a lost connection if you are sending a packet 16MB or larger if your client is older than 4.0.8 and your server is 4.0.8 and above, or the other way around.
- It is also possible to see this error if host name lookups fail (for example, if the DNS server on which your server or network relies goes down). This is because MySQL is dependent on the host system for name resolution, but has no way of knowing whether it is working—from MySQL's point of view the problem is indistinguishable from any other network timeout.

  You may also see the `MySQL server has gone away` error if MySQL is started with the `--skip-networking` [443] option.

Another networking issue that can cause this error occurs if the MySQL port (default 3306) is blocked by your firewall, thus preventing any connections at all to the MySQL server.

- You can also encounter this error with applications that fork child processes, all of which try to use the same connection to the MySQL server. This can be avoided by using a separate connection for each child process.
- You have encountered a bug where the server died while executing the query.

You can check whether the MySQL server died and restarted by executing `mysqladmin version` and examining the server's uptime. If the client connection was broken because `mysqld` crashed and restarted, you should concentrate on finding the reason for the crash. Start by checking whether issuing the query again kills the server again. See What to Do If MySQL Keeps Crashing.

You can get more information about the lost connections by starting `mysqld` with the `--log-warnings=2` [434] option. This logs some of the disconnected errors in the `hostname.err` file. See The Error Log.

If you want to create a bug report regarding this problem, be sure that you include the following information:

- Indicate whether the MySQL server died. You can find information about this in the server error log. See What to Do If MySQL Keeps Crashing.
- If a specific query kills `mysqld` and the tables involved were checked with `CHECK TABLE` before you ran the query, can you provide a reproducible test case? See MySQL Internals: Porting to Other Systems.
- What is the value of the `wait_timeout` [538] system variable in the MySQL server? (`mysqladmin variables` gives you the value of this variable.)
- Have you tried to run `mysqld` with the general query log enabled to determine whether the problem query appears in the log? (See The General Query Log.)

See also Communication Errors and Aborted Connections, and How to Report Bugs or Problems.

Packet too large

A communication packet is a single SQL statement sent to the MySQL server, a single row that is sent to the client, or a binary log event sent from a master replication server to a slave.

The largest possible packet that can be transmitted to or from a MySQL 5.1 server or client is 1GB.

When a MySQL client or the `mysqld` server receives a packet bigger than `max_allowed_packet` [493] bytes, it issues a `Packet too large` error and closes the connection. With some clients, you may also get a `Lost connection to MySQL server during query` error if the communication packet is too large.

Both the client and the server have their own `max_allowed_packet` [493] variable, so if you want to handle big packets, you must increase this variable both in the client and in the server.

If you are using the `mysql` client program, its default `max_allowed_packet` [493] variable is 16MB. To set a larger value, start `mysql` like this:

```
shell> mysql --max_allowed_packet=32M
```

That sets the packet size to 32MB.

The server's default `max_allowed_packet` [493] value is 1MB. You can increase this if the server needs to handle big queries (for example, if you are working with big `BLOB` columns). For example, to set the variable to 16MB, start the server like this:

```
shell> mysqld --max_allowed_packet=16M
```

You can also use an option file to set `max_allowed_packet` [493]. For example, to set the size for the server to 16MB, add the following lines in an option file:

```
[mysqld]
max_allowed_packet=16M
```

It is safe to increase the value of this variable because the extra memory is allocated only when needed. For example, `mysqld` allocates more memory only when you issue a long query or when `mysqld` must return a large result row. The small default value of the variable is a precaution to catch incorrect packets between the client and server and also to ensure that you do not run out of memory by using large packets accidentally.

You can also get strange problems with large packets if you are using large `BLOB` values but have not given `mysqld` access to enough memory to handle the query. If you suspect this is the case, try adding `ulimit -d 256000` to the beginning of the `mysqld_safe` script and restarting `mysqld`.

Communication Errors and Aborted Connections

If connection problems occur such as communication errors or aborted connections, use these sources of information to diagnose problems:

- The error log. See The Error Log.
- The general query log. See The General Query Log.
- The `Aborted_xxx` status variables. See Server Status Variables.

If you start the server with the `--log-warnings` [434] option, you might find messages like this in your error log:

```
010301 14:38:23  Aborted connection 854 to db:
'users' user: 'josh'
```

If a client successfully connects but later disconnects improperly or is terminated, the server increments the `Aborted_clients` [559] status variable, and logs an `Aborted connection` message to the error log. The cause can be any of the following:

- The client program did not call `mysql_close()` before exiting.
- The client had been sleeping more than `wait_timeout` [538] or `interactive_timeout` [482] seconds without issuing any requests to the server. See Server System Variables.
- The client program ended abruptly in the middle of a data transfer.

If a client is unable even to connect, the server increments the `Aborted_connects` [559] status variable. Unsuccessful connection attempts can occur for the following reasons:

- A client does not have privileges to connect to a database.
- A client uses an incorrect password.
- A connection packet does not contain the right information.
- It takes more than `connect_timeout` [468] seconds to get a connect packet. See Server System Variables.

If these kinds of things happen, it might indicate that someone is trying to break into your server! Messages for these types of problems are logged to the general query log if it is enabled.

Other reasons for problems with aborted clients or aborted connections:

- The `max_allowed_packet` [493] variable value is too small or queries require more memory than you have allocated for `mysqld`. See `Packet too large`.
- Use of Ethernet protocol with Linux, both half and full duplex. Many Linux Ethernet drivers have this bug. You should test for this bug by transferring a huge file using FTP between the client and server machines. If a transfer goes in burst-pause-burst-pause mode, you are experiencing a Linux duplex syndrome. Switch the duplex mode for both your network card and hub/switch to either full duplex or to half duplex and test the results to determine the best setting.
- A problem with the thread library that causes interrupts on reads.
- Badly configured TCP/IP.
- Faulty Ethernets, hubs, switches, cables, and so forth. This can be diagnosed properly only by replacing hardware.

See also `MySQL server has gone away`.

The table is full

If a table-full error occurs, it may be that the disk is full or that the table has reached its maximum size. The effective maximum table size for MySQL databases is usually determined by operating system constraints on file sizes, not by MySQL internal limits. See Limits on Table Size.

This error can occur sometimes for MySQL Cluster tables even when there appears to be more than sufficient data memory available. See the documentation for the `DataMemory` [1817] MySQL Cluster data node configuration parameter, as well as MySQL Cluster Nodes, Node Groups, Replicas, and Partitions, for more information.

Can't create/write to file

If you get an error of the following type for some queries, it means that MySQL cannot create a temporary file for the result set in the temporary directory:

```
Can't create/write to file '\\sqla3fe_0.ism'.
```

The preceding error is a typical message for Windows; the Unix message is similar.

One fix is to start `mysqld` with the `--tmpdir` [447] option or to add the option to the `[mysqld]` section of your option file. For example, to specify a directory of `C:\temp`, use these lines:

```
[mysqld]
tmpdir=C:/temp
```

The `C:\temp` directory must exist and have sufficient space for the MySQL server to write to. See Using Option Files.

Another cause of this error can be permissions issues. Make sure that the MySQL server can write to the `tmpdir` [534] directory.

Check also the error code that you get with `perror`. One reason the server cannot write to a table is that the file system is full:

```
shell> perror 28
OS error code  28:  No space left on device
```

If you get an error of the following type during startup, it indicates that the file system or directory used for storing data files is write protected. Providing the write error is to a test file, This error is not serious and can be safely ignored.

```
Can't create test file /usr/local/mysql/data/master.lower-test
```

Commands out of sync

If you get `Commands out of sync; you can't run this command now` in your client code, you are calling client functions in the wrong order.

This can happen, for example, if you are using `mysql_use_result()` and try to execute a new query before you have called `mysql_free_result()`. It can also happen if you try to execute two queries that return data without calling `mysql_use_result()` or `mysql_store_result()` in between.

Ignoring user

If you get the following error, it means that when `mysqld` was started or when it reloaded the grant tables, it found an account in the `user` table that had an invalid password.

`Found wrong password for user 'some_user'@'some_host'; ignoring user`

As a result, the account is simply ignored by the permission system.

The following list indicates possible causes of and fixes for this problem:

- You may be running a new version of `mysqld` with an old `user` table. You can check this by executing `mysqlshow mysql user` to see whether the `Password` column is shorter than 16 characters. If so, you can correct this condition by running the `scripts/add_long_password` script.
- The account has an old password (eight characters long). Update the account in the `user` table to have a new password.
- You have specified a password in the `user` table without using the `PASSWORD()` [1030] function. Use `mysql` to update the account in the `user` table with a new password, making sure to use the `PASSWORD()` [1030] function:

```
mysql> UPDATE user SET Password=PASSWORD('newpwd')
    -> WHERE User='some_user' AND Host='some_host';
```

Table '*tbl_name*' doesn't exist

If you get either of the following errors, it usually means that no table exists in the default database with the given name:

```
Table 'tbl_name' doesn't exist
Can't find file: 'tbl_name' (errno: 2)
```

In some cases, it may be that the table does exist but that you are referring to it incorrectly:

- Because MySQL uses directories and files to store databases and tables, database and table names are case sensitive if they are located on a file system that has case-sensitive file names.
- Even for file systems that are not case sensitive, such as on Windows, all references to a given table within a query must use the same lettercase.

You can check which tables are in the default database with `SHOW TABLES`. See `SHOW` Syntax.

Can't initialize character set

You might see an error like this if you have character set problems:

```
MySQL Connection Failed: Can't initialize character set charset_name
```

This error can have any of the following causes:

- The character set is a multi-byte character set and you have no support for the character set in the client. In this case, you need to recompile the client by running `configure` with the `--with-charset=charset_name` [135] or `--with-extra-charsets=charset_name` [135] option. See MySQL Source-Configuration Options.

All standard MySQL binaries are compiled with `--with-extra-charsets=complex` [135] or (for Windows) `--with-extra-charsets=complex` [135], which enables support for all multi-byte character sets. See MySQL Source-Configuration Options.

- The character set is a simple character set that is not compiled into `mysqld`, and the character set definition files are not in the place where the client expects to find them.

  In this case, you need to use one of the following methods to solve the problem:

  - Recompile the client with support for the character set. See MySQL Source-Configuration Options.
  - Specify to the client the directory where the character set definition files are located. For many clients, you can do this with the `--character-sets-dir` option.
  - Copy the character definition files to the path where the client expects them to be.

`'File' Not Found` and Similar Errors

If you get `ERROR '...' not found (errno: 23)`, `Can't open file: ... (errno: 24)`, or any other error with `errno 23` or `errno 24` from MySQL, it means that you haven't allocated enough file descriptors for the MySQL server. You can use the `perror` utility to get a description of what the error number means:

```
shell> perror 23
OS error code  23:  File table overflow
shell> perror 24
OS error code  24:  Too many open files
shell> perror 11
OS error code  11:  Resource temporarily unavailable
```

The problem here is that `mysqld` is trying to keep open too many files simultaneously. You can either tell `mysqld` not to open so many files at once or increase the number of file descriptors available to `mysqld`.

To tell `mysqld` to keep open fewer files at a time, you can make the table cache smaller by reducing the value of the `table_open_cache` [530] system variable (the default value is 64). This may not entirely prevent running out of file descriptors because in some circumstances the server may attempt to extend the cache size temporarily, as described in How MySQL Opens and Closes Tables. Reducing the value of `max_connections` [493] also reduces the number of open files (the default value is 100).

To change the number of file descriptors available to `mysqld`, you can use the `--open-files-limit` [242] option to `mysqld_safe` or set the `open_files_limit` [508] system variable. See Server System Variables. The easiest way to set these values is to add an option to your option file. See Using Option Files. If you have an old version of `mysqld` that does not support setting the open files limit, you can edit the `mysqld_safe` script. There is a commented-out line `ulimit -n 256` in the script. You can remove the "`#`" character to uncomment this line, and change the number `256` to set the number of file descriptors to be made available to `mysqld`.

`--open-files-limit` [242] and `ulimit` can increase the number of file descriptors, but only up to the limit imposed by the operating system. There is also a "hard" limit that can be overridden only if you start `mysqld_safe` or `mysqld` as `root` (just remember that you also need to start the server with the `--user` [448] option in this case so that it does not continue to run as `root` after it starts up). If you need to increase the operating system limit on the number of file descriptors available to each process, consult the documentation for your system.

Note

If you run the `tcsh` shell, `ulimit` does not work! `tcsh` also reports incorrect values when you ask for the current limits. In this case, you should start `mysqld_safe` using `sh`.

Table-Corruption Issues

If you have started `mysqld` with `--myisam-recover` [436], MySQL automatically checks and tries to repair `MyISAM` tables if they are marked as 'not closed properly' or 'crashed'. If this happens, MySQL writes an entry in the `hostname.err` file `'Warning: Checking table ...'` which is followed by `Warning: Repairing table` if the table needs to be repaired. If you get a lot of these errors, without `mysqld` having died unexpectedly just before, then something is wrong and needs to be investigated further.

See also Server Command Options, and Making a Test Case If You Experience Table Corruption.

Installation-Related Issues

Problems with File Permissions

If you have problems with file permissions, the `UMASK` environment variable might be set incorrectly when `mysqld` starts. For example, MySQL might issue the following error message when you create a table:

```
ERROR: Can't find file: 'path/with/filename.frm' (Errcode: 13)
```

The default `UMASK` value is `0660`. You can change this behavior by starting `mysqld_safe` as follows:

```
shell> UMASK=384  # = 600 in octal
shell> export UMASK
shell> mysqld_safe &
```

By default, MySQL creates database directories with an access permission value of `0700`. You can modify this behavior by setting the `UMASK_DIR` variable. If you set its value, new directories are created with the combined `UMASK` and `UMASK_DIR` values. For example, if you want to give group access to all new directories, you can do this:

```
shell> UMASK_DIR=504  # = 770 in octal
shell> export UMASK_DIR
shell> mysqld_safe &
```

MySQL assumes that the value for `UMASK` or `UMASK_DIR` is in octal if it starts with a zero.

See Environment Variables.

Administration-Related Issues

How to Reset the Root Password

If you have never set a `root` password for MySQL, the server does not require a password at all for connecting as `root`. However, this is insecure. For instructions on assigning passwords, see Securing the Initial MySQL Accounts.

If you know the `root` password, but want to change it, see `SET PASSWORD` Syntax.

If you set a `root` password previously, but have forgotten it, you can set a new password. The following sections provide instructions for Windows and Unix systems, as well as generic instructions that apply to any system.

Resetting the Root Password: Windows Systems

On Windows, use the following procedure to reset the password for all MySQL `root` accounts:

1. Log on to your system as Administrator.

2. Stop the MySQL server if it is running. For a server that is running as a Windows service, go to the Services manager: From the Start menu, select Control Panel, then Administrative Tools, then Services. Find the MySQL service in the list and stop it.

   If your server is not running as a service, you may need to use the Task Manager to force it to stop.

3. Create a text file containing the following statements. Replace the password with the password that you want to use.

   ```
   UPDATE mysql.user SET Password=PASSWORD('MyNewPass') WHERE User='root';
   FLUSH PRIVILEGES;
   ```

   Write the `UPDATE` and `FLUSH` statements each on a single line. The `UPDATE` statement resets the password for all `root` accounts, and the `FLUSH` statement tells the server to reload the grant tables into memory so that it notices the password change.

4. Save the file. For this example, the file will be named `C:\mysql-init.txt`.

5. Open a console window to get to the command prompt: From the Start menu, select Run, then enter `cmd` as the command to be run.

6. Start the MySQL server with the special `--init-file` [429] option (notice that the backslash in the option value is doubled):

   ```
   C:\> C:\mysql\bin\mysqld --init-file=C:\\mysql-init.txt
   ```

   If you installed MySQL to a location other than `C:\mysql`, adjust the command accordingly.

   The server executes the contents of the file named by the `--init-file` [429] option at startup, changing each `root` account password.

   You can also add the `--console` [422] option to the command if you want server output to appear in the console window rather than in a log file.

   If you installed MySQL using the MySQL Installation Wizard, you may need to specify a `--defaults-file` [234] option:

   ```
   C:\> "C:\Program Files\MySQL\MySQL Server 5.1\bin\mysqld.exe"
           --defaults-file="C:\\Program Files\\MySQL\\MySQL Server 5.1\\my.ini"
           --init-file=C:\\mysql-init.txt
   ```

   The appropriate `--defaults-file` [234] setting can be found using the Services Manager: From the Start menu, select Control Panel, then Administrative Tools, then Services. Find the MySQL service in the list, right-click it, and choose the `Properties` option. The `Path to executable` field contains the `--defaults-file` [234] setting.

7. After the server has started successfully, delete `C:\mysql-init.txt`.

You should now be able to connect to the MySQL server as `root` using the new password. Stop the MySQL server, then restart it in normal mode again. If you run the server as a service, start it from the Windows Services window. If you start the server manually, use whatever command you normally use.

Resetting the Root Password: Unix Systems

On Unix, use the following procedure to reset the password for all MySQL `root` accounts. The instructions assume that you will start the server so that it runs using the Unix login account that you normally use for running the server. For example, if you run the server using the `mysql` login account, you should log in as `mysql` before using the instructions. Alternatively, you can log in as `root`, but in this case you *must* start `mysqld` with the `--user=mysql` [448] option. If you start the server as `root` without using `--user=mysql` [448], the server may create `root`-owned files in the data directory, such as log files, and these may cause permission-related problems for future server startups. If that happens, you will need to either change the ownership of the files to `mysql` or remove them.

1. Log on to your system as the Unix user that the `mysqld` server runs as (for example, `mysql`).

2. Locate the `.pid` file that contains the server's process ID. The exact location and name of this file depend on your distribution, host name, and configuration. Common locations are `/var/lib/mysql/`, `/var/run/mysqld/`, and `/usr/local/mysql/data/`. Generally, the file name has an extension of `.pid` and begins with either `mysqld` or your system's host name.

   You can stop the MySQL server by sending a normal `kill` (not `kill -9`) to the `mysqld` process, using the path name of the `.pid` file in the following command:

   ```
   shell> kill `cat /mysql-data-directory/host_name.pid`
   ```

   Use backticks (not forward quotation marks) with the `cat` command. These cause the output of `cat` to be substituted into the `kill` command.

3. Create a text file containing the following statements. Replace the password with the password that you want to use.

   ```
   UPDATE mysql.user SET Password=PASSWORD('MyNewPass') WHERE User='root';
   FLUSH PRIVILEGES;
   ```

   Write the `UPDATE` and `FLUSH` statements each on a single line. The `UPDATE` statement resets the password for all `root` accounts, and the `FLUSH` statement tells the server to reload the grant tables into memory so that it notices the password change.

4. Save the file. For this example, the file will be named `/home/me/mysql-init`. The file contains the password, so it should not be saved where it can be read by other users. If you are not logged in as `mysql` (the user the server runs as), make sure that the file has permissions that permit `mysql` to read it.

5. Start the MySQL server with the special `--init-file` [429] option:

   ```
   shell> mysqld_safe --init-file=/home/me/mysql-init &
   ```

   The server executes the contents of the file named by the `--init-file` [429] option at startup, changing each `root` account password.

6. After the server has started successfully, delete `/home/me/mysql-init`.

You should now be able to connect to the MySQL server as `root` using the new password. Stop the server and restart it normally.

Resetting the Root Password: Generic Instructions

The preceding sections provide password-resetting instructions for Windows and Unix systems. Alternatively, on any platform, you can set the new password using the `mysql` client (but this approach is less secure):

1. Stop `mysqld` and restart it with the `--skip-grant-tables` [443] option. This enables anyone to connect without a password and with all privileges. Because this is insecure, you might want to use `--skip-grant-tables` [443] in conjunction with `--skip-networking` [443] to prevent remote clients from connecting.

2. Connect to the `mysqld` server with this command:

   ```
   shell> mysql
   ```

3. Issue the following statements in the `mysql` client. Replace the password with the password that you want to use.

   ```
   mysql> UPDATE mysql.user SET Password=PASSWORD('MyNewPass')
       -> WHERE User='root';
   mysql> FLUSH PRIVILEGES;
   ```

The FLUSH statement tells the server to reload the grant tables into memory so that it notices the password change.

You should now be able to connect to the MySQL server as root using the new password. Stop the server, then restart it normally (without the --skip-grant-tables [443] and --skip-networking [443] options).

What to Do If MySQL Keeps Crashing

Each MySQL version is tested on many platforms before it is released. This does not mean that there are no bugs in MySQL, but if there are bugs, they should be very few and can be hard to find. If you have a problem, it always helps if you try to find out exactly what crashes your system, because you have a much better chance of getting the problem fixed quickly.

First, you should try to find out whether the problem is that the mysqld server dies or whether your problem has to do with your client. You can check how long your mysqld server has been up by executing mysqladmin version. If mysqld has died and restarted, you may find the reason by looking in the server's error log. See The Error Log.

On some systems, you can find in the error log a stack trace of where mysqld died that you can resolve with the resolve_stack_dump program. See MySQL Internals: Porting to Other Systems. Note that the variable values written in the error log may not always be 100% correct.

Many server crashes are caused by corrupted data files or index files. MySQL updates the files on disk with the write() system call after every SQL statement and before the client is notified about the result. (This is not true if you are running with --delay-key-write [425], in which case data files are written but not index files.) This means that data file contents are safe even if mysqld crashes, because the operating system ensures that the unflushed data is written to disk. You can force MySQL to flush everything to disk after every SQL statement by starting mysqld with the --flush [428] option.

The preceding means that normally you should not get corrupted tables unless one of the following happens:

- The MySQL server or the server host was killed in the middle of an update.
- You have found a bug in mysqld that caused it to die in the middle of an update.
- Some external program is manipulating data files or index files at the same time as mysqld without locking the table properly.
- You are running many mysqld servers using the same data directory on a system that does not support good file system locks (normally handled by the lockd lock manager), or you are running multiple servers with external locking disabled.
- You have a crashed data file or index file that contains very corrupt data that confused mysqld.
- You have found a bug in the data storage code. This isn't likely, but it is at least possible. In this case, you can try to change the storage engine to another engine by using ALTER TABLE on a repaired copy of the table.

Because it is very difficult to know why something is crashing, first try to check whether things that work for others crash for you. Please try the following things:

- Stop the mysqld server with mysqladmin shutdown, run myisamchk --silent --force */*.MYI from the data directory to check all MyISAM tables, and restart mysqld. This ensures that you are running from a clean state. See Chapter 5, *MySQL Server Administration*.
- Start mysqld with the general query log enabled (see The General Query Log). Then try to determine from the information written to the log whether some specific query kills the server. About

95% of all bugs are related to a particular query. Normally, this is one of the last queries in the log file just before the server restarts. See The General Query Log. If you can repeatedly kill MySQL with a specific query, even when you have checked all tables just before issuing it, then you have been able to locate the bug and should submit a bug report for it. See How to Report Bugs or Problems.

- Try to make a test case that we can use to repeat the problem. See MySQL Internals: Porting to Other Systems.
- Try running the tests in the `mysql-test` directory and the MySQL benchmarks. See The MySQL Test Suite. They should test MySQL rather well. You can also add code to the benchmarks that simulates your application. The benchmarks can be found in the `sql-bench` directory in a source distribution or, for a binary distribution, in the `sql-bench` directory under your MySQL installation directory.
- Try the `fork_big.pl` script. (It is located in the `tests` directory of source distributions.)
- If you configure MySQL for debugging, it is much easier to gather information about possible errors if something goes wrong. Configuring MySQL for debugging causes a safe memory allocator to be included that can find some errors. It also provides a lot of output about what is happening. Reconfigure MySQL with the `--with-debug` [135] or `--with-debug=full` [135] option to `configure` and then recompile. See MySQL Internals: Porting to Other Systems.
- Make sure that you have applied the latest patches for your operating system.
- Use the `--skip-external-locking` [442] option to `mysqld`. On some systems, the `lockd` lock manager does not work properly; the `--skip-external-locking` [442] option tells `mysqld` not to use external locking. (This means that you cannot run two `mysqld` servers on the same data directory and that you must be careful if you use `myisamchk`. Nevertheless, it may be instructive to try the option as a test.)
- Have you tried `mysqladmin -u root processlist` when `mysqld` appears to be running but not responding? Sometimes `mysqld` is not comatose even though you might think so. The problem may be that all connections are in use, or there may be some internal lock problem. `mysqladmin -u root processlist` usually is able to make a connection even in these cases, and can provide useful information about the current number of connections and their status.
- Run the command `mysqladmin -i 5 status` or `mysqladmin -i 5 -r status` in a separate window to produce statistics while you run your other queries.
- Try the following:

  1. Start `mysqld` from `gdb` (or another debugger). See MySQL Internals: Porting to Other Systems.
  2. Run your test scripts.
  3. Print the backtrace and the local variables at the three lowest levels. In `gdb`, you can do this with the following commands when `mysqld` has crashed inside `gdb`:

     ```
     backtrace
     info local
     up
     info local
     up
     info local
     ```

     With `gdb`, you can also examine which threads exist with `info threads` and switch to a specific thread with `thread N`, where *`N`* is the thread ID.

- Try to simulate your application with a Perl script to force MySQL to crash or misbehave.
- Send a normal bug report. See How to Report Bugs or Problems. Be even more detailed than usual. Because MySQL works for many people, it may be that the crash results from something that exists only on your computer (for example, an error that is related to your particular system libraries).

- If you have a problem with tables containing dynamic-length rows and you are using only `VARCHAR` columns (not `BLOB` or `TEXT` columns), you can try to change all `VARCHAR` to `CHAR` with `ALTER TABLE`. This forces MySQL to use fixed-size rows. Fixed-size rows take a little extra space, but are much more tolerant to corruption.

  The current dynamic row code has been in use for several years with very few problems, but dynamic-length rows are by nature more prone to errors, so it may be a good idea to try this strategy to see whether it helps.

- Do not rule out your server hardware when diagnosing problems. Defective hardware can be the cause of data corruption. Particular attention should be paid to your memory and disk subsystems when troubleshooting hardware.

How MySQL Handles a Full Disk

This section describes how MySQL responds to disk-full errors (such as “no space left on device”), and to quota-exceeded errors (such as “write failed” or “user block limit reached”).

This section is relevant for writes to `MyISAM` tables. It also applies for writes to binary log files and binary log index file, except that references to “row” and “record” should be understood to mean “event.”

When a disk-full condition occurs, MySQL does the following:

- It checks once every minute to see whether there is enough space to write the current row. If there is enough space, it continues as if nothing had happened.
- Every 10 minutes it writes an entry to the log file, warning about the disk-full condition.

To alleviate the problem, you can take the following actions:

- To continue, you only have to free enough disk space to insert all records.
- To abort the thread, you must use `mysqladmin kill`. The thread is aborted the next time it checks the disk (in one minute).
- Other threads might be waiting for the table that caused the disk-full condition. If you have several “locked” threads, killing the one thread that is waiting on the disk-full condition enables the other threads to continue.

Exceptions to the preceding behavior are when you use `REPAIR TABLE` or `OPTIMIZE TABLE` or when the indexes are created in a batch after `LOAD DATA INFILE` or after an `ALTER TABLE` statement. All of these statements may create large temporary files that, if left to themselves, would cause big problems for the rest of the system. If the disk becomes full while MySQL is doing any of these operations, it removes the big temporary files and mark the table as crashed. The exception is that for `ALTER TABLE`, the old table is left unchanged.

Where MySQL Stores Temporary Files

On Unix, MySQL uses the value of the `TMPDIR` environment variable as the path name of the directory in which to store temporary files. If `TMPDIR` is not set, MySQL uses the system default, which is usually `/tmp`, `/var/tmp`, or `/usr/tmp`.

On Windows, Netware and OS2, MySQL checks in order the values of the `TMPDIR`, `TEMP`, and `TMP` environment variables. For the first one found to be set, MySQL uses it and does not check those remaining. If none of `TMPDIR`, `TEMP`, or `TMP` are set, MySQL uses the Windows system default, which is usually `C:\windows\temp\`.

If the file system containing your temporary file directory is too small, you can use the `--tmpdir` [447] option to `mysqld` to specify a directory in a file system where you have enough space.

In MySQL 5.1, the `--tmpdir` [447] option can be set to a list of several paths that are used in round-robin fashion. Paths should be separated by colon characters (“`:`”) on Unix and semicolon characters (“`;`”) on Windows, NetWare, and OS/2.

Note

To spread the load effectively, these paths should be located on different *physical* disks, not different partitions of the same disk.

If the MySQL server is acting as a replication slave, you should not set `--tmpdir` [447] to point to a directory on a memory-based file system or to a directory that is cleared when the server host restarts. A replication slave needs some of its temporary files to survive a machine restart so that it can replicate temporary tables or `LOAD DATA INFILE` operations. If files in the temporary file directory are lost when the server restarts, replication fails.

MySQL creates all temporary files as hidden files. This ensures that the temporary files are removed if `mysqld` is terminated. The disadvantage of using hidden files is that you do not see a big temporary file that fills up the file system in which the temporary file directory is located.

When sorting (`ORDER BY` or `GROUP BY`), MySQL normally uses one or two temporary files. The maximum disk space required is determined by the following expression:

```
(length of what is sorted + sizeof(row pointer))
* number of matched rows
* 2
```

The row pointer size is usually four bytes, but may grow in the future for really big tables.

For some `SELECT` queries, MySQL also creates temporary SQL tables. These are not hidden and have names of the form `SQL_*`.

`ALTER TABLE` creates a temporary table in the same directory as the original table.

How to Protect or Change the MySQL Unix Socket File

The default location for the Unix socket file that the server uses for communication with local clients is `/tmp/mysql.sock`. (For some distribution formats, the directory might be different, such as `/var/lib/mysql` for RPMs.)

On some versions of Unix, anyone can delete files in the `/tmp` directory or other similar directories used for temporary files. If the socket file is located in such a directory on your system, this might cause problems.

On most versions of Unix, you can protect your `/tmp` directory so that files can be deleted only by their owners or the superuser (`root`). To do this, set the `sticky` bit on the `/tmp` directory by logging in as `root` and using the following command:

```
shell> chmod +t /tmp
```

You can check whether the `sticky` bit is set by executing `ls -ld /tmp`. If the last permission character is `t`, the bit is set.

Another approach is to change the place where the server creates the Unix socket file. If you do this, you should also let client programs know the new location of the file. You can specify the file location in several ways:

- Specify the path in a global or local option file. For example, put the following lines in `/etc/my.cnf`:

```
[mysqld]
socket=/path/to/socket

[client]
socket=/path/to/socket
```

See Using Option Files.

- Specify a `--socket` [226] option on the command line to `mysqld_safe` and when you run client programs.
- Set the `MYSQL_UNIX_PORT` environment variable to the path of the Unix socket file.
- Recompile MySQL from source to use a different default Unix socket file location. Define the path to the file with the `--with-unix-socket-path` [134] option when you run `configure`. See MySQL Source-Configuration Options.

You can test whether the new socket location works by attempting to connect to the server with this command:

```
shell> mysqladmin --socket=/path/to/socket version
```

Time Zone Problems

If you have a problem with `SELECT NOW()` returning values in UTC and not your local time, you have to tell the server your current time zone. The same applies if `UNIX_TIMESTAMP()` [995] returns the wrong value. This should be done for the environment in which the server runs; for example, in `mysqld_safe` or `mysql.server`. See Environment Variables.

You can set the time zone for the server with the `--timezone=`*`timezone_name`* [243] option to `mysqld_safe`. You can also set it by setting the `TZ` environment variable before you start `mysqld`.

The permissible values for `--timezone` [243] or `TZ` are system dependent. Consult your operating system documentation to see what values are acceptable.

Query-Related Issues

Case Sensitivity in String Searches

For nonbinary strings (`CHAR`, `VARCHAR`, `TEXT`), string searches use the collation of the comparison operands. For binary strings (`BINARY`, `VARBINARY`, `BLOB`), comparisons use the numeric values of the bytes in the operands; this means that for alphabetic characters, comparisons will be case sensitive.

A comparison between a nonbinary string and binary string is treated as a comparison of binary strings.

Simple comparison operations (`>=, >, =, <, <=`, sorting, and grouping) are based on each character's "sort value." Characters with the same sort value are treated as the same character. For example, if "`e`" and "`é`" have the same sort value in a given collation, they compare as equal.

The default character set and collation are `latin1` and `latin1_swedish_ci`, so nonbinary string comparisons are case insensitive by default. This means that if you search with *`col_name`* `LIKE 'a%'`, you get all column values that start with `A` or `a`. To make this search case sensitive, make sure that one of the operands has a case sensitive or binary collation. For example, if you are comparing a column and a string that both have the `latin1` character set, you can use the `COLLATE` operator to cause either operand to have the `latin1_general_cs` or `latin1_bin` collation:

```
col_name COLLATE latin1_general_cs LIKE 'a%'
col_name LIKE 'a%' COLLATE latin1_general_cs
col_name COLLATE latin1_bin LIKE 'a%'
col_name LIKE 'a%' COLLATE latin1_bin
```

If you want a column always to be treated in case-sensitive fashion, declare it with a case sensitive or binary collation. See `CREATE TABLE` Syntax.

To cause a case-sensitive comparison of nonbinary strings to be case insensitive, use `COLLATE` to name a case-insensitive collation. The strings in the following example normally are case sensitive, but `COLLATE` changes the comparison to be case insensitive:

```
mysql> SET @s1 = 'MySQL' COLLATE latin1_bin,
    ->     @s2 = 'mysql' COLLATE latin1_bin;
mysql> SELECT @s1 = @s2;
+-----------+
| @s1 = @s2 |
+-----------+
|         0 |
+-----------+
mysql> SELECT @s1 COLLATE latin1_swedish_ci = @s2;
+-------------------------------------+
| @s1 COLLATE latin1_swedish_ci = @s2 |
+-------------------------------------+
|                                   1 |
+-------------------------------------+
```

A binary string is case sensitive in comparisons. To compare the string as case insensitive, convert it to a nonbinary string and use `COLLATE` to name a case-insensitive collation:

```
mysql> SET @s = BINARY 'MySQL';
mysql> SELECT @s = 'mysql';
+--------------+
| @s = 'mysql' |
+--------------+
|            0 |
+--------------+
mysql> SELECT CONVERT(@s USING latin1) COLLATE latin1_swedish_ci = 'mysql';
+-------------------------------------------------------------------+
| CONVERT(@s USING latin1) COLLATE latin1_swedish_ci = 'mysql' |
+-------------------------------------------------------------------+
|                                                                 1 |
+-------------------------------------------------------------------+
```

To determine whether a value will compare as a nonbinary or binary string, use the `COLLATION()` [1033] function. This example shows that `VERSION()` [1039] returns a string that has a case-insensitive collation, so comparisons are case insensitive:

```
mysql> SELECT COLLATION(VERSION());
+----------------------+
| COLLATION(VERSION()) |
+----------------------+
| utf8_general_ci      |
+----------------------+
```

For binary strings, the collation value is `binary`, so comparisons will be case sensitive. One context in which you will see `binary` is for compression and encryption functions, which return binary strings as a general rule: string:

```
mysql> SELECT COLLATION(ENCRYPT('x')), COLLATION(SHA1('x'));
+-------------------------+----------------------+
| COLLATION(ENCRYPT('x')) | COLLATION(SHA1('x')) |
+-------------------------+----------------------+
| binary                  | binary               |
+-------------------------+----------------------+
```

Problems Using `DATE` Columns

The format of a `DATE` value is `'YYYY-MM-DD'`. According to standard SQL, no other format is permitted. You should use this format in `UPDATE` expressions and in the `WHERE` clause of `SELECT` statements. For example:

```
SELECT * FROM t1 WHERE date >= '2003-05-05';
```

As a convenience, MySQL automatically converts a date to a number if the date is used in a numeric context and vice versa. MySQL also permits a “relaxed” string format when updating and in a `WHERE` clause that compares a date to a `DATE`, `DATETIME`, or `TIMESTAMP` column. “Relaxed” format means that any punctuation character may be used as the separator between parts. For example, `'2004-08-15'` and `'2004#08#15'` are equivalent. MySQL can also convert a string containing no separators (such as `'20040815'`), provided it makes sense as a date.

When you compare a `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP` to a constant string with the `<`, `<=`, `=`, `>=`, `>`, or `BETWEEN` operators, MySQL normally converts the string to an internal long integer for faster comparison (and also for a bit more “relaxed” string checking). However, this conversion is subject to the following exceptions:

- When you compare two columns
- When you compare a `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP` column to an expression
- When you use any comparison method other than those just listed, such as `IN` or `STRCMP()` [962].

For those exceptions, the comparison is done by converting the objects to strings and performing a string comparison.

To be on the safe side, assume that strings are compared as strings and use the appropriate string functions if you want to compare a temporal value to a string.

The special “zero” date `'0000-00-00'` can be stored and retrieved as `'0000-00-00'`. When a `'0000-00-00'` date is used through Connector/ODBC, it is automatically converted to `NULL` because ODBC cannot handle that kind of date.

Because MySQL performs the conversions just described, the following statements work (assume that `idate` is a `DATE` column):

```
INSERT INTO t1 (idate) VALUES (19970505);
INSERT INTO t1 (idate) VALUES ('19970505');
INSERT INTO t1 (idate) VALUES ('97-05-05');
INSERT INTO t1 (idate) VALUES ('1997.05.05');
INSERT INTO t1 (idate) VALUES ('1997 05 05');
INSERT INTO t1 (idate) VALUES ('0000-00-00');

SELECT idate FROM t1 WHERE idate >= '1997-05-05';
SELECT idate FROM t1 WHERE idate >= 19970505;
SELECT MOD(idate,100) FROM t1 WHERE idate >= 19970505;
SELECT idate FROM t1 WHERE idate >= '19970505';
```

However, the following statement does not work:

```
SELECT idate FROM t1 WHERE STRCMP(idate,'20030505')=0;
```

`STRCMP()` [962] is a string function, so it converts `idate` to a string in `'YYYY-MM-DD'` format and performs a string comparison. It does not convert `'20030505'` to the date `'2003-05-05'` and perform a date comparison.

If you enable the `ALLOW_INVALID_DATES` [572] SQL mode, MySQL permits you to store dates that are given only limited checking: MySQL requires only that the day is in the range from 1 to 31 and the month is in the range from 1 to 12. This makes MySQL very convenient for Web applications where you obtain year, month, and day in three different fields and you want to store exactly what the user inserted (without date validation).

MySQL permits you to store dates where the day or month and day are zero. This is convenient if you want to store a birthdate in a `DATE` column and you know only part of the date. To disallow zero month or day parts in dates, enable the `NO_ZERO_IN_DATE` [575] SQL mode.

MySQL permits you to store a “zero” value of `'0000-00-00'` as a “dummy date.” This is in some cases more convenient than using `NULL` values. If a date to be stored in a `DATE` column cannot be converted to any reasonable value, MySQL stores `'0000-00-00'`. To disallow `'0000-00-00'`, enable the `NO_ZERO_DATE` [575] SQL mode.

To have MySQL check all dates and accept only legal dates (unless overridden by `IGNORE`), set the `sql_mode` [526] system variable to `"NO_ZERO_IN_DATE,NO_ZERO_DATE"`.

Problems with `NULL` Values

The concept of the NULL value is a common source of confusion for newcomers to SQL, who often think that NULL is the same thing as an empty string ''. This is not the case. For example, the following statements are completely different:

```
mysql> INSERT INTO my_table (phone) VALUES (NULL);
mysql> INSERT INTO my_table (phone) VALUES ('');
```

Both statements insert a value into the phone column, but the first inserts a NULL value and the second inserts an empty string. The meaning of the first can be regarded as “phone number is not known” and the meaning of the second can be regarded as “the person is known to have no phone, and thus no phone number.”

To help with NULL handling, you can use the IS NULL [940] and IS NOT NULL [941] operators and the IFNULL() [947] function.

In SQL, the NULL value is never true in comparison to any other value, even NULL. An expression that contains NULL always produces a NULL value unless otherwise indicated in the documentation for the operators and functions involved in the expression. All columns in the following example return NULL:

```
mysql> SELECT NULL, 1+NULL, CONCAT('Invisible',NULL);
```

To search for column values that are NULL, you cannot use an expr = NULL test. The following statement returns no rows, because expr = NULL is never true for any expression:

```
mysql> SELECT * FROM my_table WHERE phone = NULL;
```

To look for NULL values, you must use the IS NULL [940] test. The following statements show how to find the NULL phone number and the empty phone number:

```
mysql> SELECT * FROM my_table WHERE phone IS NULL;
mysql> SELECT * FROM my_table WHERE phone = '';
```

See Working with NULL Values, for additional information and examples.

You can add an index on a column that can have NULL values if you are using the MyISAM, InnoDB, or MEMORY storage engine. Otherwise, you must declare an indexed column NOT NULL, and you cannot insert NULL into the column.

When reading data with LOAD DATA INFILE, empty or missing columns are updated with ''. To load a NULL value into a column, use \N in the data file. The literal word “NULL” may also be used under some circumstances. See LOAD DATA INFILE Syntax.

When using DISTINCT, GROUP BY, or ORDER BY, all NULL values are regarded as equal.

When using ORDER BY, NULL values are presented first, or last if you specify DESC to sort in descending order.

Aggregate (summary) functions such as COUNT() [1045], MIN() [1047], and SUM() [1047] ignore NULL values. The exception to this is COUNT(*) [1045], which counts rows and not individual column values. For example, the following statement produces two counts. The first is a count of the number of rows in the table, and the second is a count of the number of non-NULL values in the age column:

```
mysql> SELECT COUNT(*), COUNT(age) FROM person;
```

For some data types, MySQL handles NULL values specially. If you insert NULL into a TIMESTAMP column, the current date and time is inserted. If you insert NULL into an integer or floating-point column that has the AUTO_INCREMENT attribute, the next number in the sequence is inserted.

Problems with Column Aliases

An alias can be used in a query select list to give a column a different name. You can use the alias in `GROUP BY`, `ORDER BY`, or `HAVING` clauses to refer to the column:

```
SELECT SQRT(a*b) AS root FROM tbl_name
  GROUP BY root HAVING root > 0;
SELECT id, COUNT(*) AS cnt FROM tbl_name
  GROUP BY id HAVING cnt > 0;
SELECT id AS 'Customer identity' FROM tbl_name;
```

Standard SQL disallows references to column aliases in a `WHERE` clause. This restriction is imposed because when the `WHERE` clause is evaluated, the column value may not yet have been determined. For example, the following query is illegal:

```
SELECT id, COUNT(*) AS cnt FROM tbl_name
  WHERE cnt > 0 GROUP BY id;
```

The `WHERE` clause determines which rows should be included in the `GROUP BY` clause, but it refers to the alias of a column value that is not known until after the rows have been selected, and grouped by the `GROUP BY`.

In the select list of a query, a quoted column alias can be specified using identifier or string quoting characters:

```
SELECT 1 AS `one`, 2 AS 'two';
```

Elsewhere in the statement, quoted references to the alias must use identifier quoting or the reference is treated as a string literal. For example, this statement groups by the values in column `id`, referenced using the alias `` `a` ``:

```
SELECT id AS 'a', COUNT(*) AS cnt FROM tbl_name
  GROUP BY `a`;
```

But this statement groups by the literal string `'a'` and will not work as expected:

```
SELECT id AS 'a', COUNT(*) AS cnt FROM tbl_name
  GROUP BY 'a';
```

Rollback Failure for Nontransactional Tables

If you receive the following message when trying to perform a `ROLLBACK`, it means that one or more of the tables you used in the transaction do not support transactions:

```
Warning: Some non-transactional changed tables couldn't be rolled back
```

These nontransactional tables are not affected by the `ROLLBACK` statement.

If you were not deliberately mixing transactional and nontransactional tables within the transaction, the most likely cause for this message is that a table you thought was transactional actually is not. This can happen if you try to create a table using a transactional storage engine that is not supported by your `mysqld` server (or that was disabled with a startup option). If `mysqld` does not support a storage engine, it instead creates the table as a `MyISAM` table, which is nontransactional.

You can check the storage engine for a table by using either of these statements:

```
SHOW TABLE STATUS LIKE 'tbl_name';
SHOW CREATE TABLE tbl_name;
```

See `SHOW TABLE STATUS` Syntax, and `SHOW CREATE TABLE` Syntax.

You can check which storage engines your `mysqld` server supports by using this statement:

```
SHOW ENGINES;
```

You can also use the following statement, and check the value of the variable that is associated with the storage engine in which you are interested:

```
SHOW VARIABLES LIKE 'have_%';
```

For example, to determine whether the InnoDB storage engine is available, check the value of the have_innodb [480] variable.

See SHOW ENGINES Syntax, and SHOW VARIABLES Syntax.

Deleting Rows from Related Tables

If the total length of the DELETE statement for related_table is more than 1MB (the default value of the max_allowed_packet [493] system variable), you should split it into smaller parts and execute multiple DELETE statements. You probably get the fastest DELETE by specifying only 100 to 1,000 related_column values per statement if the related_column is indexed. If the related_column isn't indexed, the speed is independent of the number of arguments in the IN clause.

Solving Problems with No Matching Rows

If you have a complicated query that uses many tables but that returns no rows, you should use the following procedure to find out what is wrong:

1. Test the query with EXPLAIN to check whether you can find something that is obviously wrong. See EXPLAIN Syntax.
2. Select only those columns that are used in the WHERE clause.
3. Remove one table at a time from the query until it returns some rows. If the tables are large, it is a good idea to use LIMIT 10 with the query.
4. Issue a SELECT for the column that should have matched a row against the table that was last removed from the query.
5. If you are comparing FLOAT or DOUBLE columns with numbers that have decimals, you cannot use equality (=) comparisons. This problem is common in most computer languages because not all floating-point values can be stored with exact precision. In some cases, changing the FLOAT to a DOUBLE fixes this. See Problems with Floating-Point Values.
6. If you still cannot figure out what is wrong, create a minimal test that can be run with mysql test < query.sql that shows your problems. You can create a test file by dumping the tables with mysqldump --quick db_name *tbl_name_1 ... tbl_name_n* > query.sql. Open the file in an editor, remove some insert lines (if there are more than needed to demonstrate the problem), and add your SELECT statement at the end of the file.

   Verify that the test file demonstrates the problem by executing these commands:

   ```
   shell> mysqladmin create test2
   shell> mysql test2 < query.sql
   ```

   Attach the test file to a bug report, which you can file using the instructions in How to Report Bugs or Problems.

Problems with Floating-Point Values

Floating-point numbers sometimes cause confusion because they are approximate and not stored as exact values. A floating-point value as written in an SQL statement may not be the same as the value represented internally. Attempts to treat floating-point values as exact in comparisons may lead to problems. They are also subject to platform or implementation dependencies. The FLOAT and DOUBLE data types are subject to these issues. For DECIMAL columns, MySQL performs operations with a precision of 65 decimal digits, which should solve most common inaccuracy problems.

The following example uses `DOUBLE` to demonstrate how calculations that are done using floating-point operations are subject to floating-point error.

```
mysql> CREATE TABLE t1 (i INT, d1 DOUBLE, d2 DOUBLE);
mysql> INSERT INTO t1 VALUES (1, 101.40, 21.40), (1, -80.00, 0.00),
    -> (2, 0.00, 0.00), (2, -13.20, 0.00), (2, 59.60, 46.40),
    -> (2, 30.40, 30.40), (3, 37.00, 7.40), (3, -29.60, 0.00),
    -> (4, 60.00, 15.40), (4, -10.60, 0.00), (4, -34.00, 0.00),
    -> (5, 33.00, 0.00), (5, -25.80, 0.00), (5, 0.00, 7.20),
    -> (6, 0.00, 0.00), (6, -51.40, 0.00);

mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b
    -> FROM t1 GROUP BY i HAVING a <> b;

+------+-------+------+
| i    | a     | b    |
+------+-------+------+
|    1 |  21.4 | 21.4 |
|    2 |  76.8 | 76.8 |
|    3 |   7.4 |  7.4 |
|    4 |  15.4 | 15.4 |
|    5 |   7.2 |  7.2 |
|    6 | -51.4 |    0 |
+------+-------+------+
```

The result is correct. Although the first five records look like they should not satisfy the comparison (the values of `a` and `b` do not appear to be different), they may do so because the difference between the numbers shows up around the tenth decimal or so, depending on factors such as computer architecture or the compiler version or optimization level. For example, different CPUs may evaluate floating-point numbers differently.

If columns `d1` and `d2` had been defined as `DECIMAL` rather than `DOUBLE`, the result of the `SELECT` query would have contained only one row—the last one shown above.

The correct way to do floating-point number comparison is to first decide on an acceptable tolerance for differences between the numbers and then do the comparison against the tolerance value. For example, if we agree that floating-point numbers should be regarded the same if they are same within a precision of one in ten thousand (0.0001), the comparison should be written to find differences larger than the tolerance value:

```
mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b FROM t1
    -> GROUP BY i HAVING ABS(a - b) > 0.0001;
+------+-------+------+
| i    | a     | b    |
+------+-------+------+
|    6 | -51.4 |    0 |
+------+-------+------+
1 row in set (0.00 sec)
```

Conversely, to get rows where the numbers are the same, the test should find differences within the tolerance value:

```
mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b FROM t1
    -> GROUP BY i HAVING ABS(a - b) <= 0.0001;
+------+------+------+
| i    | a    | b    |
+------+------+------+
|    1 | 21.4 | 21.4 |
|    2 | 76.8 | 76.8 |
|    3 |  7.4 |  7.4 |
|    4 | 15.4 | 15.4 |
|    5 |  7.2 |  7.2 |
+------+------+------+
5 rows in set (0.03 sec)
```

Floating-point values are subject to platform or implementation dependencies. Suppose that you execute the following statements:

```
CREATE TABLE t1(c1 FLOAT(53,0), c2 FLOAT(53,0));
INSERT INTO t1 VALUES('1e+52','-1e+52');
SELECT * FROM t1;
```

On some platforms, the `SELECT` statement returns `inf` and `-inf`. On others, it returns `0` and `-0`.

An implication of the preceding issues is that if you attempt to create a replication slave by dumping table contents with `mysqldump` on the master and reloading the dump file into the slave, tables containing floating-point columns might differ between the two hosts.

Optimizer-Related Issues

MySQL uses a cost-based optimizer to determine the best way to resolve a query. In many cases, MySQL can calculate the best possible query plan, but sometimes MySQL does not have enough information about the data at hand and has to make “educated” guesses about the data.

For the cases when MySQL does not do the "right" thing, tools that you have available to help MySQL are:

- Use the `EXPLAIN` statement to get information about how MySQL processes a query. To use it, just add the keyword `EXPLAIN` to the front of your `SELECT` statement:

  ```
  mysql> EXPLAIN SELECT * FROM t1, t2 WHERE t1.i = t2.i;
  ```

  `EXPLAIN` is discussed in more detail in `EXPLAIN` Syntax.

- Use `ANALYZE TABLE` *`tbl_name`* to update the key distributions for the scanned table. See `ANALYZE TABLE` Syntax.

- Use `FORCE INDEX` for the scanned table to tell MySQL that table scans are very expensive compared to using the given index:

  ```
  SELECT * FROM t1, t2 FORCE INDEX (index_for_column)
  WHERE t1.col_name=t2.col_name;
  ```

  `USE INDEX` and `IGNORE INDEX` may also be useful. See Index Hint Syntax.

- Global and table-level `STRAIGHT_JOIN`. See `SELECT` Syntax.

- You can tune global or thread-specific system variables. For example, start `mysqld` with the `--max-seeks-for-key=1000` [498] option or use `SET max_seeks_for_key=1000` to tell the optimizer to assume that no key scan causes more than 1,000 key seeks. See Server System Variables.

Table Definition-Related Issues

Problems with `ALTER TABLE`

If you get a duplicate-key error when using `ALTER TABLE` to change the character set or collation of a character column, the cause is either that the new column collation maps two keys to the same value or that the table is corrupted. In the latter case, you should run `REPAIR TABLE` on the table.

If `ALTER TABLE` dies with the following error, the problem may be that MySQL crashed during an earlier `ALTER TABLE` operation and there is an old table named `A-`*`xxx`* or `B-`*`xxx`* lying around:

```
Error on rename of './database/name.frm'
to './database/B-xxx.frm' (Errcode: 17)
```

In this case, go to the MySQL data directory and delete all files that have names starting with `A-` or `B-`. (You may want to move them elsewhere instead of deleting them.)

`ALTER TABLE` works in the following way:

- Create a new table named `A-xxx` with the requested structural changes.
- Copy all rows from the original table to `A-xxx`.
- Rename the original table to `B-xxx`.
- Rename `A-xxx` to your original table name.
- Delete `B-xxx`.

If something goes wrong with the renaming operation, MySQL tries to undo the changes. If something goes seriously wrong (although this shouldn't happen), MySQL may leave the old table as `B-xxx`. A simple rename of the table files at the system level should get your data back.

If you use `ALTER TABLE` on a transactional table or if you are using Windows or OS/2, `ALTER TABLE` unlocks the table if you had done a `LOCK TABLE` on it. This is done because `InnoDB` and these operating systems cannot drop a table that is in use.

`TEMPORARY` Table Problems

The following list indicates limitations on the use of `TEMPORARY` tables:

- A `TEMPORARY` table can only be of type `MEMORY`, `MyISAM`, `MERGE`, or `InnoDB`.

  Temporary tables are not supported for MySQL Cluster.

- You cannot refer to a `TEMPORARY` table more than once in the same query. For example, the following does not work:

```
mysql> SELECT * FROM temp_table, temp_table AS t2;
ERROR 1137: Can't reopen table: 'temp_table'
```

  This error also occurs if you refer to a temporary table multiple times in a stored function under different aliases, even if the references occur in different statements within the function.

- The `SHOW TABLES` statement does not list `TEMPORARY` tables.
- You cannot use `RENAME` to rename a `TEMPORARY` table. However, you can use `ALTER TABLE` instead:

```
mysql> ALTER TABLE orig_name RENAME new_name;
```

- There are known issues in using temporary tables with replication. See Replication Features and Issues, for more information.

Known Issues in MySQL

This section lists known issues in recent versions of MySQL.

For information about platform-specific issues, see the installation and porting instructions in General Installation Guidance, and MySQL Internals: Porting to Other Systems.

The following problems are known:

- Subquery optimization for `IN` is not as effective as for `=`.
- Even if you use `lower_case_table_names=2` (which enables MySQL to remember the case used for databases and table names), MySQL does not remember the case used for database names for the function `DATABASE()` [1034] or within the various logs (on case-insensitive systems).
- Dropping a `FOREIGN KEY` constraint does not work in replication because the constraint may have another name on the slave.

- `REPLACE` (and `LOAD DATA` with the `REPLACE` option) does not trigger `ON DELETE CASCADE`.
- `DISTINCT` with `ORDER BY` does not work inside `GROUP_CONCAT()` [1046] if you do not use all and only those columns that are in the `DISTINCT` list.
- If one user has a long-running transaction and another user drops a table that is updated in the transaction, there is small chance that the binary log may contain the `DROP TABLE` statement before the table is used in the transaction itself.
- When inserting a big integer value (between 2^{63} and 2^{64}–1) into a decimal or string column, it is inserted as a negative value because the number is evaluated in a signed integer context.
- `FLUSH TABLES WITH READ LOCK` does not block `COMMIT` if the server is running without binary logging, which may cause a problem (of consistency between tables) when doing a full backup.
- `ANALYZE TABLE`, `OPTIMIZE TABLE`, and `REPAIR TABLE` may cause problems on tables for which you are using `INSERT DELAYED`.
- Performing `LOCK TABLE ...` and `FLUSH TABLES ...` does not guarantee that there isn't a half-finished transaction in progress on the table.
- With statement-based binary logging, the master writes the executed queries to the binary log. This is a very fast, compact, and efficient logging method that works perfectly in most cases. However, it is possible for the data on the master and slave to become different if a query is designed in such a way that the data modification is nondeterministic (generally not a recommended practice, even outside of replication).

  For example:

  - `CREATE TABLE ... SELECT` or `INSERT ... SELECT` statements that insert zero or `NULL` values into an `AUTO_INCREMENT` column.
  - `DELETE` if you are deleting rows from a table that has foreign keys with `ON DELETE CASCADE` properties.
  - `REPLACE ... SELECT`, `INSERT IGNORE ... SELECT` if you have duplicate key values in the inserted data.

  If and only if the preceding queries have no `ORDER BY` clause guaranteeing a deterministic order.

  For example, for `INSERT ... SELECT` with no `ORDER BY`, the `SELECT` may return rows in a different order (which results in a row having different ranks, hence getting a different number in the `AUTO_INCREMENT` column), depending on the choices made by the optimizers on the master and slave.

  A query is optimized differently on the master and slave only if:

  - The table is stored using a different storage engine on the master than on the slave. (It is possible to use different storage engines on the master and slave. For example, you can use `InnoDB` on the master, but `MyISAM` on the slave if the slave has less available disk space.)
  - MySQL buffer sizes (`key_buffer_size` [483], and so on) are different on the master and slave.
  - The master and slave run different MySQL versions, and the optimizer code differs between these versions.

  This problem may also affect database restoration using `mysqlbinlog|mysql`.

  The easiest way to avoid this problem is to add an `ORDER BY` clause to the aforementioned nondeterministic queries to ensure that the rows are always stored or modified in the same order. Using row-based or mixed logging format also avoids the problem.

- Log file names are based on the server host name if you do not specify a file name with the startup option. To retain the same log file names if you change your host name to something else, you must explicitly use options such as `--log-bin=old_host_name-bin` [1647]. See Server Command Options. Alternatively, rename the old files to reflect your host name change. If these are binary logs, you must edit the binary log index file and fix the binary log file names there as well. (The same is true for the relay logs on a slave server.)

- `mysqlbinlog` does not delete temporary files left after a `LOAD DATA INFILE` statement. See `mysqlbinlog` — Utility for Processing Binary Log Files.

- `RENAME` does not work with `TEMPORARY` tables or tables used in a `MERGE` table.

- Due to the way table format (`.frm`) files are stored, you cannot use character 255 (`CHAR(255)`) in table names, column names, or enumerations.

- When using `SET CHARACTER SET`, you cannot use translated characters in database, table, and column names.

- You cannot use "_" or "%" with `ESCAPE` in `LIKE ... ESCAPE` [959].

- Only the first `max_sort_length` [498] bytes are used when comparing data values. This means that values cannot reliably be used in `GROUP BY`, `ORDER BY` or `DISTINCT` if they are not distinct in the first `max_sort_length` [498] bytes. To work around this, increase the variable value. The default value of `max_sort_length` [498] is 1024 and can be changed at server startup time or at runtime.

- Numeric calculations are done with `BIGINT` or `DOUBLE` (both are normally 64 bits long). Which precision you get depends on the function. The general rule is that bit functions are performed with `BIGINT` precision, `IF()` [947] and `ELT()` [951] with `BIGINT` or `DOUBLE` precision, and the rest with `DOUBLE` precision. You should try to avoid using unsigned long long values if they resolve to be larger than 63 bits (9223372036854775807) for anything other than bit fields.

- You can have up to 255 `ENUM` and `SET` columns in one table.

- In `MIN()` [1047], `MAX()` [1046], and other aggregate functions, MySQL currently compares `ENUM` and `SET` columns by their string value rather than by the string's relative position in the set.

- In an `UPDATE` statement, columns are updated from left to right. If you refer to an updated column, you get the updated value instead of the original value. For example, the following statement increments `KEY` by `2`, **not** `1`:

```
mysql> UPDATE tbl_name SET KEY=KEY+1,KEY=KEY+1;
```

- You can refer to multiple temporary tables in the same query, but you cannot refer to any given temporary table more than once. For example, the following does not work:

```
mysql> SELECT * FROM temp_table, temp_table AS t2;
ERROR 1137: Can't reopen table: 'temp_table'
```

- The optimizer may handle `DISTINCT` differently when you are using "hidden" columns in a join than when you are not. In a join, hidden columns are counted as part of the result (even if they are not shown), whereas in normal queries, hidden columns do not participate in the `DISTINCT` comparison.

  An example of this is:

```
SELECT DISTINCT mp3id FROM band_downloads
       WHERE userid = 9 ORDER BY id DESC;
```

  and

```
SELECT DISTINCT band_downloads.mp3id
       FROM band_downloads,band_mp3
       WHERE band_downloads.userid = 9
```

```
      AND band_mp3.id = band_downloads.mp3id
      ORDER BY band_downloads.id DESC;
```

In the second case, using MySQL Server 3.23.x, you may get two identical rows in the result set (because the values in the hidden `id` column may differ).

Note that this happens only for queries that do not have the `ORDER BY` columns in the result.

- If you execute a `PROCEDURE` on a query that returns an empty set, in some cases the `PROCEDURE` does not transform the columns.
- Creation of a table of type `MERGE` does not check whether the underlying tables are compatible types.
- If you use `ALTER TABLE` to add a `UNIQUE` index to a table used in a `MERGE` table and then add a normal index on the `MERGE` table, the key order is different for the tables if there was an old, non-`UNIQUE` key in the table. This is because `ALTER TABLE` puts `UNIQUE` indexes before normal indexes to be able to detect duplicate keys as early as possible.

This appendix lists the changes from version to version in the MySQL source code through the latest version of MySQL 5.1, which is currently MySQL 5.1.67. We offer a version of the Manual for each series of MySQL releases (5.0, 5.1, and so forth). For information about changes in another release series of the MySQL database software, see the corresponding version of this Manual.

We update this section as we add new features in the 5.1 series, so that everybody can follow the development process.

Note that we tend to update the manual at the same time we make changes to MySQL. If you find a recent version of MySQL listed here that you can't find on our download page (http://dev.mysql.com/downloads/), it means that the version has not yet been released.

The date mentioned with a release version is the date of the last Bazaar ChangeSet on which the release was based, not the date when the packages were made available. The binaries are usually made available a few days after the date of the tagged ChangeSet, because building and testing all packages takes some time.

The manual included in the source and binary distributions may not be fully accurate when it comes to the release changelog entries, because the integration of the manual happens at build time. For the most up-to-date release changelog, please refer to the online version instead.

Changes in Release 5.1.x (Production)

An overview of features added in MySQL 5.1 can be found here: What Is New in MySQL 5.1. For a full list of changes, please refer to the changelog sections for individual 5.1 releases.

For discussion of upgrade issues that you may encounter for upgrades from MySQL 5.0 to MySQL 5.1, see Upgrading from MySQL 5.0 to 5.1.

For changes relating to MySQL Cluster, see Changes in MySQL Cluster NDB 6.1 - 7.1.

Changes in MySQL 5.1.66 (2012-09-28)

Bugs Fixed

- **InnoDB**: Certain `information_schema` tables originally introduced in MySQL 5.6 are now also available in MySQL 5.5 and MySQL 5.1: `INNODB_BUFFER_PAGE`, `INNODB_BUFFER_PAGE_LRU`, and `INNODB_BUFFER_POOL_STATS`. (Bug #13113026)

- **InnoDB**: When a `SELECT ... FOR UPDATE`, `UPDATE`, or other SQL statement scanned rows in an `InnoDB` table using a `<` or `<=` operator in a `WHERE` clause, the next row after the affected range could also be locked. This issue could cause a lock wait timeout for a row that was not expected to be locked. The issue occurred under various isolation levels, such as `READ COMMITTED` [1224] and `REPEATABLE READ` [1224]. (Bug #11765218)

- **Partitioning**: The buffer for the row currently read from each partition used for sorted reads was allocated on open and freed only when the partitioning handler was closed or destroyed. For SELECT statements on tables with many partitions and large rows, this could cause the server to use excessive amounts of memory.

  This issue has been addressed by allocating buffers for reads from partitioned tables only when they are needed and freeing them immediately once they are no longer needed. As part of this fix, memory is now allocated for reading from rows only in partitions that have not been pruned (see Partition Pruning). (Bug #13025132)

  References: See also Bug #11764622, Bug #14537277.

- **Replication**: In master-master replication with `--log-slave-updates` [1628] enabled, setting a user variable and then performing inserts using this variable caused the `Exec_master_log_position` column in the output of `SHOW SLAVE STATUS` not to be updated. (Bug #13596613)

- Small `sort_buffer_size` [523] values could result in a server crash. (Bug #14111180)

- The `libmysqlclient_r` client library exported symbols from `yaSSL` that conflict with OpenSSL. If a program linked against that library and `libcurl`, it could crash with a segmentation fault. (Bug #14068244)

- The argument for `LIMIT` must be an integer, but if the argument was given by a placeholder in a prepared statement, the server did not reject noninteger values such as `'5'`. (Bug #13868860)

- Access to `INFORMATION_SCHEMA` tables through a view could leak memory. (Bug #13734987)

- A query for a `FEDERATED` table could return incorrect results when the underlying table had a compound index on two columns and the query included an `AND` condition on the columns. (Bug #12876932)

- The argument to the `--ssl-key` [658] option was not verified to exist and be a valid key. The resulting connection used SSL, but the key was not used. (Bug #62743, Bug #13115401)

- In debug builds, an `InnoDB` assertion was overly aggressive about prohibiting an open range. (Bug #66513, Bug #14547952)

- Adding a `LIMIT` clause to a query containing `GROUP BY` and `ORDER BY` could cause the optimizer to choose an incorrect index for processing the query, and return more rows than required. (Bug #54599, Bug #11762052)

- `mysqlbinlog` did not accept input on the standard input when the standard input was a pipe. (Bug #49336, Bug #11757312)

Changes in MySQL 5.1.65 (2012-08-09)

Functionality Added or Changed

- **Important Change**: The `YEAR(2)` data type is now deprecated because it is problematic. Support for `YEAR(2)` will be removed in a future release of MySQL. For more information, see `YEAR(2)` Limitations and Migrating to `YEAR(4)`.

Bugs Fixed

- The server did not build with `gcc` 4.7. (Bug #14238406)

Changes in MySQL 5.1.64 (Not released)

Functionality Added or Changed

- **Important Change**: **Replication**: The `SHOW BINARY LOGS` statement (and its equivalent `SHOW MASTER LOGS`) may now be executed by a user with the `REPLICATION CLIENT` [627] privilege. (Formerly, the `SUPER` [628] privilege was necessary to use either form of this statement.)

Bugs Fixed

- **InnoDB**: If a row was deleted from an `InnoDB` table, then another row was re-inserted with the same primary key value, an attempt by a concurrent transaction to lock the row could succeed when it should have waited. This issue occurred if the locking select used a `WHERE` clause that performed an index scan using a secondary index. (Bug #14100254, Bug #65389)

- **InnoDB**: In a transaction using the `REPEATABLE READ` [1224] isolation level, an `UPDATE` or `DELETE` statement for an `InnoDB` table could sometimes overlook rows recently committed by other transactions. As explained in Consistent Nonlocking Reads, DML statements within a `REPEATABLE READ` transaction apply to rows committed by other transactions, even if a query could not see those rows. (Bug #14007649, Bug #65111)

- **InnoDB**: Using the `KILL` statement to terminate a query could cause an unnecessary message in the error log:

  ```
  [ERROR] Got error -1 when reading table table_name
  ```

  (Bug #13933132)

- **InnoDB**: For an `InnoDB` table with a trigger, under the setting `innodb_autoinc_lock_mode=1` [1362], sometimes auto-increment values could be interleaved when inserting into the table from two sessions concurrently. The sequence of auto-increment values could vary depending on timing, leading to data inconsistency in systems using replication. (Bug #12752572, Bug #61579)

- **InnoDB**: The `CHECK TABLE` statement could fail for a large `InnoDB` table due to a timeout value of 2 hours. For typical storage devices, the issue could occur for tables that exceeded approximately 200 or 350 GB, depending on I/O speed. The fix relaxes the locking performed on the table being checked, which makes the timeout less likely. It also makes `InnoDB` recognize the syntax `CHECK TABLE QUICK`, which avoids the possibility of the timeout entirely. (Bug #11758510, Bug #50723)

- **Replication**: It was theoretically possible for concurrent execution of more than one instance of `SHOW BINLOG EVENTS` to crash the MySQL Server. (Bug #13979418)

- **Replication**: An event whose length exceeded the size of the master dump thread's `max_allowed_packet` [493] caused replication to fail. This could occur when updating many large rows and using row-based replication.

  As part of this fix, a new server option `--slave-max-allowed-packet` [1625] is added, which permits max_allowed_packet to be exceeded by the slave SQL and I/O threads. Now the size of a packet transmitted from the master to the slave is checked only against this value (available as the value of the `slave_max_allowed_packet` [1625] server system variable), and not against the value of `max_allowed_packet`. (Bug #12400221, Bug #60926)

- **Replication**: Statements using `AUTO_INCREMENT`, `LAST_INSERT_ID()` [1036], `RAND()` [975], or user variables could be applied in the wrong context on the slave when using statement-based replication and replication filtering server options (see How Servers Evaluate Replication Filtering Rules). (Bug #11761686, Bug #54201)

  References: See also Bug #11754117, Bug #45670, Bug #11746146, Bug #23894.

- **Replication**: An `INSERT` into a table that has a composite primary key that includes an `AUTO_INCREMENT` column that is not the first column of this composite key is not safe for statement-

based binary logging or replication. Such statements are now marked as unsafe and fail with an error when using the `STATEMENT` binary logging format. For more information, see Determination of Safe and Unsafe Statements in Binary Logging, as well as Replication and `AUTO_INCREMENT`.

Note

Tables using the `InnoDB` storage engine are not affected by this issue, since `InnoDB` does not allow the creation of a composite key that includes an `AUTO_INCREMENT` column, where this column is not the first column in the key.

(Bug #11754117, Bug #45670)

References: See also Bug #11761686, Bug #54201, Bug #11746146, Bug #23894.

- **Replication**: After upgrading a replication slave to MySQL 5.5.60 or later, enabling the query cache eventually caused the slave to fail. (Bug #64624, Bug #14005409)
- Incorrect stored program caching could cause statements within a stored program that included a `GROUP BY` clause to return different results across multiple program invocations. (Bug #13805127)
- For queries with `ORDER BY COUNT(*)` and `LIMIT`, the optimizer could choose an execution plan that produced incorrect results. (Bug #12713907)
- `SHOW TABLES` was very slow unless the required information was already in the disk cache. (Bug #60961, Bug #12427262)
- `mysqlbinlog` exited with no error code if file write errors occurred. (Bug #55289, Bug #11762667)
- yaSSL rejected valid SSL certificates that OpenSSL accepts. (Bug #54348, Bug #11761822)
- Sessions could end up deadlocked when executing a combination of `SELECT`, `DROP TABLE`, `KILL`, and `SHOW ENGINE INNODB STATUS`. (Bug #60682, Bug #12636001)

Changes in MySQL 5.1.63 (2012-05-07)

Bugs Fixed

- **Security Fix**: Bug #64884 was fixed.
- **Security Fix**: Bug #59387 was fixed.
- **Important Change**: **Partitioning**: The query cache did not always function correctly with partitioned tables in a transactional context. For this reason, the query cache is now disabled for any queries using partitioned tables, and such queries can no longer be cached. For more information, see Restrictions and Limitations on Partitioning. (Bug #11761296, Bug #53775)
- **InnoDB**: Deleting a huge amount of data from `InnoDB` tables within a short time could cause the purge operation that removes delete-marked records to stall. This issue could result in unnecessary disk space use, but does not cause any problems with data integrity. If this issue causes a disk space shortage, restart the server to work around it. This issue is only likely to occur on 32-bit platforms. (Bug #13847885)
- **InnoDB**: If the server crashed during a `TRUNCATE TABLE` or `CREATE INDEX` statement for an `InnoDB` table, or a `DROP DATABASE` statement for a database containing `InnoDB` tables, an index could be corrupted, causing an error message when accessing the table after restart:

```
InnoDB: Error: trying to load index index_name for table table_name
InnoDB: but the index tree has been freed!
```

In MySQL 5.1, this fix applies to the InnoDB Plugin, but not the built-in InnoDB storage engine. (Bug #12861864, Bug #11766019)

- **InnoDB**: When data was removed from an `InnoDB` table, newly inserted data might not reuse the freed disk blocks, leading to an unexpected size increase for the system tablespace or `.ibd` file (depending on the setting of `innodb_file_per_table` [1367]. The `OPTIMIZE TABLE` could compact a `.ibd` file in some cases but not others. The freed disk blocks would eventually be reused as additional data was inserted. (Bug #11766634, Bug #59783)

- **Replication**: The `--relay-log-space-limit` [1634] option was sometimes ignored.

  More specifically, when the SQL thread went to sleep, it allowed the I/O thread to queue additional events in such a way that the relay log space limit was bypassed, and the number of events in the queue could grow well past the point where the relay logs needed to be rotated. Now in such cases, the SQL thread checks to see whether the I/O thread should rotate and provide the SQL thread a chance to purge the logs (thus freeing space).

  Note that, when the SQL thread is in the middle of a transaction, it cannot purge the logs; it can only ask for more events until the transaction is complete. Once the transaction is finished, the SQL thread can immediately instruct the I/O thread to rotate. (Bug #12400313, Bug #64503)

  References: See also Bug #13806492.

- Mishandling of `NO_BACKSLASH_ESCAPES` [573] SQL mode within stored procedures on slave servers could cause replication failures. (Bug #12601974)

- If the system time was adjusted backward during query execution, the apparent execution time could be negative. But in some cases these queries would be written to the slow query log, with the negative execution time written as a large unsigned number. Now statements with apparent negative execution time are not written to the slow query log. (Bug #63524, Bug #13454045)

  References: See also Bug #27208.

- `mysql_store_result()` and `mysql_use_result()` are not for use with prepared statements and are not intended to be called following `mysql_stmt_execute()`, but failed to return an error when invoked that way in `libmysqld`. (Bug #62136, Bug #13738989)

  References: See also Bug #47485.

- `SHOW` statements treated stored procedure, stored function, and event names as case sensitive. (Bug #56224, Bug #11763507)

- On Windows, `mysqlslap` crashed for attempts to connect using shared memory. (Bug #31173, Bug #11747181, Bug #59107, Bug #11766072)

Changes in MySQL 5.1.62 (2012-03-21)

Functionality Added or Changed

- New `utf8_general_mysql500_ci` and `ucs2_general_mysql500_ci` collations have been added that preserve the behavior of `utf8_general_ci` and `ucs2_general_ci` from versions of MySQL previous to 5.1.24. Bug #27877 corrected an error in the original collations but introduced an incompatibility for columns that contain German `'ß'` LATIN SMALL LETTER SHARP S. (As a result of the fix, that character compares equal to characters with which it previously compared different.) A symptom of the problem after upgrading to MySQL 5.1.24 or newer from a version older than 5.1.24 is that `CHECK TABLE` produces this error:

  ```
  Table upgrade required.
  Please do "REPAIR TABLE `t`" or dump/reload to fix it!
  ```

  Unfortunately, `REPAIR TABLE` could not fix the problem. The new collations permit older tables created before MySQL 5.1.24 to be upgraded to current versions of MySQL.

To convert an affected table after a binary upgrade that leaves the table files in place, alter the table to use the new collation. Suppose that the table `t1` contains one or more problematic `utf8` columns. To convert the table at the table level, use a statement like this:

```
ALTER TABLE t1
CONVERT TO CHARACTER SET utf8 COLLATE utf8_general_mysql500_ci;
```

To apply the change on a column-specific basis, use a statement like this (be sure to repeat the column definition as originally specified except for the `COLLATE` clause):

```
ALTER TABLE t1
MODIFY c1 CHAR(N) CHARACTER SET utf8 COLLATE utf8_general_mysql500_ci;
```

To upgrade the table using a dump and reload procedure, dump the table using `mysqldump`, modify the `CREATE TABLE` statement in the dump file to use the new collation, and reload the table.

After making the appropriate changes, `CHECK TABLE` should report no error.

For more information, see Checking Whether Tables or Indexes Must Be Rebuilt, and Rebuilding or Repairing Tables or Indexes. (Bug #43593, Bug #11752408)

- yaSSL was upgraded from version 1.7.2 to 2.2.0.

Bugs Fixed

- **Security Fix**: Bug #63775 was fixed.
- **Incompatible Change**: An earlier change (in MySQL 5.1.59 and 5.5.16) was found to modify date-handling behavior in General Availability-status series (MySQL 5.1 and 5.5). This change has been reverted.

  The change was that several functions became more strict when passed a `DATE()` [982] function value as their argument, thus they rejected incomplete dates with a day part of zero. These functions were affected: `CONVERT_TZ()` [981], `DATE_ADD()` [983], `DATE_SUB()` [986], `DAYOFYEAR()` [987], `LAST_DAY()` [988], `TIMESTAMPDIFF()` [994], `TO_DAYS()` [994], `TO_SECONDS()`, `WEEK()` [996], `WEEKDAY()` [997], `WEEKOFYEAR()` [997], `YEARWEEK()` [997]. The previous behavior has been restored. (Bug #13458237)

- **Important Change**: **InnoDB**: When a row grew in size due to an `UPDATE` operation, other (non-updated) columns could be moved to off-page storage so that information about the row still fit within the constraints of the `InnoDB` page size. The pointer to the new allocated off-page data was not set up until the pages were allocated and written, potentially leading to lost data if the system crashed while the column was being moved out of the page. The problem was more common with tables using `ROW_FORMAT=DYNAMIC` or `ROW_FORMAT=COMPRESSED` along with the Barracuda file format, particularly with the `innodb_file_per_table` [1367] setting enabled, because page allocation operations are more common as the `.ibd` tablespace files are extended. Still, the problem could occur with any combination of InnoDB version, file format, and row format.

  A related issue was that during such an `UPDATE` operation, or an `INSERT` operation that reused a delete-marked record, other transactions could see invalid data for the affected column, regardless of isolation level.

  The fix corrects the order of operations for moving the column data off the original page and replacing it with a pointer. Now if a crash occurs at the precise moment when the column data is being transferred, the transfer will not be re-run during crash recovery.

  In MySQL 5.1, this fix applies to the InnoDB Plugin, but not the built-in InnoDB storage engine. (Bug #13721257, Bug #12612184, Bug #12704861)

- **InnoDB**: An erroneous assertion could occur, in debug builds only, when creating an index on a column containing zero-length values (that is, `''`). (Bug #13654923)

- **InnoDB**: A DDL operation such as `ALTER TABLE ... ADD COLUMN` could stall, eventually timing out with an `Error 1005: Can't create table` message referring to `fil_rename_tablespace`. (Bug #13636122, Bug #62100, Bug #63553)

- **InnoDB**: References to C preprocessor symbols and macros `HAVE_purify`, `UNIV_INIT_MEM_TO_ZERO`, and `UNIV_SET_MEM_TO_ZERO` were removed from the `InnoDB` source code. They were only used in debug builds instrumented for Valgrind. They are replaced by calls to the `UNIV_MEM_INVALID()` macro. (Bug #13418934)

- **InnoDB**: A DDL operation for an `InnoDB` table could cause a busy MySQL server to halt with an assertion error:

  ```
  InnoDB: Failing assertion: trx->error_state == DB_SUCCESS
  ```

  The error occurred if the DDL operation was run while all 1023 undo slots were in use by concurrent transactions. This error was less likely to occur in MySQL 5.5 and 5.6, because raising the number of `InnoDB` undo slots increased the number of simultaneous transactions (corresponding to the number of undo slots) from 1K to 128K. (Bug #12739098, Bug #62401)

- **InnoDB**: With 1024 concurrent `InnoDB` transactions running concurrently and the `innodb_file_per_table` [1367] setting enabled, a `CREATE TABLE` operation for an `InnoDB` table could fail. The `.ibd` file from the failed `CREATE TABLE` was left behind, preventing the table from being created later, after the load had dropped.

  The fix adds error handling to delete the erroneous `.ibd` file. This error was less likely to occur in MySQL 5.5 and 5.6, because raising the number of `InnoDB` undo slots increased the number of simultaneous transactions needed to trigger the bug, from 1K to 128K. (Bug #12400341)

- **InnoDB**: When copying a partitioned `InnoDB` table from a Linux system to a Windows system, you could encounter this error:

  ```
  101115 14:19:53 [ERROR] Table .\test\d has no primary key in InnoDB data
  dictionary, but has one in MySQL!
  ```

  Normally, the solution to copy `InnoDB` tables from Linux to Windows is to create the tables on Linux with the `lower_case_table_names` option enabled. Partitioned tables, with `#P#` appended to the filename, were not covered by that solution. (Bug #11765438, Bug #58406)

- **InnoDB**: Server startup could produce an error for temporary tables using the `InnoDB` storage engine, if the path in the `$TMPDIR` variable ended with a `/` character. The error log would look like:

  ```
  120202 19:21:26  InnoDB: Operating system error number 2 in a file operation.
  InnoDB: The error means the system cannot find the path specified.
  InnoDB: If you are installing InnoDB, remember that you must create
  InnoDB: directories yourself, InnoDB does not create them.
  120202 19:21:26  InnoDB: Error: trying to open a table, but could not
  InnoDB: open the tablespace file './t/#sql7750_1_0.ibd'!
  InnoDB: Have you moved InnoDB .ibd files around without using the
  InnoDB: commands DISCARD TABLESPACE and IMPORT TABLESPACE?
  InnoDB: It is also possible that this is a temporary table #sql...,
  InnoDB: and MySQL removed the .ibd file for this.
  ```

  The workaround for the problem was to create a similar temporary table again, copy its `.frm` file to `tmpdir` under the name mentioned in the error message (for example, `#sql123.frm`) and restart `mysqld` with `tmpdir` set to its normal value without a trailing slash, for example `/var/tmp`. On startup, MySQL would see the `.frm` file and issue `DROP TABLE` for the orphaned temporary table. (Bug #11754376, Bug #45976)

- A query that used an index on a `CHAR` column referenced in a `BETWEEN` clause could return invalid results. (Bug #13463488, Bug #63437)

- When the optimizer performed conversion of `DECIMAL` values while evaluating range conditions, it could produce incorrect results. (Bug #13453382)

- When used with the `--xml` [302] option, `mysqldump --routines` [300] failed to dump any stored routines, triggers, or events. (Bug #11760384, Bug #52792)
- It was possible on replication slaves where `FEDERATED` tables were in use to get timeouts on long-running operations, such as Error 1160 `Got an error writing communication packets`. The `FEDERATED` tables did not need to be replicated for the issue to occur. (Bug #11758931, Bug #51196)

  References: See also Bug #12896628, Bug #61790.
- If an attempt to initiate a statement failed, the issue could not be reported to the client because it was not prepared to receive any error messages prior to the execution of any statement. Since the user could not execute any queries, they were simply disconnected without providing a clear error.

  After the fix for this issue, the client is prepared for an error as soon as it attempts to initiate a statement, so that the error can be reported prior to disconnecting the user. (Bug #11755281, Bug #47032)
- Using `myisamchk` with the sort recover method to repair a table having fixed-width row format could cause the row pointer size to be reduced, effectively resulting in a smaller maximum data file size. (Bug #48848, Bug #11756869)
- Due to improper locking, concurrent inserts into an `ARCHIVE` table at the same time as repair and check operations on the table resulted in table corruption. (Bug #37280, Bug #11748748)
- Under some circumstances, the result of `SUBSTRING_INDEX()` [958] incorrectly depended on the contents of the previous row. (Bug #42404, Bug #11751514)

Changes in MySQL 5.1.61 (2012-01-10)

Bugs Fixed

- **Important Change**: **InnoDB**: If an `ALTER TABLE` statement failed for an `InnoDB` table due to an error code from an underlying file-renaming system call, `InnoDB` could lose track of the `.ibd` file for the table. This issue only occurred when the `innodb_file_per_table` [1367] configuration option was enabled, and when the low-level error persisted through thousands of retry attempts. In MySQL 5.1, this issue applied to the InnoDB Plugin but not the built-in InnoDB storage engine.

  For example, if you encounter an error like the following:

  ```
  mysql> alter table sb2 add column d2 int;
  ERROR 1025 (HY000): Error on rename of './sbtest/#sql-1eb9_1' to
  './sbtest/sb2' (errno: -1)
  ```

  you might be able to access the `#sql*` table by copying a `.frm` file from a table with an identical schema. The table name to use for the `.frm` filewould be `` `sbtest.#mysql50##sql-1eb9_1` `` in the preceding example. (Bug #12884631, Bug #62146)
- **InnoDB**: Issuing `INSERT...ON DUPLICATE KEY` statements for `InnoDB` tables from concurrent threads could cause a deadlock, particularly with the `INSERT...ON DUPLICATE KEY UPDATE` form. The problem could also be triggered by issuing multiple `INSERT IGNORE` statements. The fix avoids deadlocks caused by the same row being accessed by more than one transaction. Deadlocks could still occur when multiple rows are inserted and updated simultaneously by different transactions in inconsistent order; those types of deadlocks require the standard error handling on the application side, of re-trying the transaction. (Bug #11759688, Bug #52020, Bug #12842206)
- An incorrect `InnoDB` assertion could cause the server to halt. This issue only affected debug builds. The assertion referenced the source file `btr0pcur.ic` and the variable `cursor->pos_state`. (Bug #13358468)
- The `handle_segfault()` signal-handler code in `mysqld` could itself crash due to calling unsafe functions. (Bug #54082, Bug #11761576)

- `ARCHIVE` tables with `NULL` columns could cause server crashes or become corrupt under concurrent load. (Bug #51252, Bug #11758979)
- Enabling `myisam_use_mmap` [504] could cause the server to crash. (Bug #48726, Bug #11756764)
- Concurrent access to `ARCHIVE` tables could cause corruption. (Bug #42784, Bug #11751793)

Changes in MySQL 5.1.60 (2011-11-16)

Functionality Added or Changed

- Upgrading from an `Advanced GPL` RPM package to an `Advanced` RPM package did not work. Now on Linux it is possible to use `rpm -U` to replace any installed MySQL product by any other of the same release family. It is not necessary to remove the old produce with `rpm -e` first. (Bug #11886309)
- `MEMORY` table creation time is now available in the `CREATE_TIME` column of the `INFORMATION_SCHEMA.TABLES` table and the `Create_time` column of `SHOW TABLE STATUS` output. (Bug #51655, Bug #11759349)

Bugs Fixed

- **Performance**: **InnoDB**: The process of deallocating the `InnoDB` Adaptive Hash Index was made faster, during shutdown or when turning off the AHI with the statement:

```
SET GLOBAL innodb_adaptive_hash_index=OFF;
```

  (Bug #13006367, Bug #62487)
- **Performance**: **InnoDB**: This fix improves the performance of instrumentation code for `InnoDB` buffer pool operations. (Bug #12950803, Bug #62294)
- **Performance**: **InnoDB**: The `InnoDB` buffer pool management code was optimized for handling pages from compressed tables. This fixes a slowdown that could occur particularly during the warmup period for the buffer pool. (Bug #12610930, Bug #61341)
- **InnoDB**: Fixed a compilation problem that affected the `InnoDB` source code with `gcc` 4.6.1. The affected `InnoDB` source file was `btr/btr0cur.c`. (Bug #13116045)
- **InnoDB**: Lookups using secondary indexes could give incorrect matches under a specific set of conditions. The conditions involve an index defined on a column prefix, for a BLOB or other long column stored outside the index page, with a table using the Barracuda file format. (Bug #12601439, Bug #12543666)
- **InnoDB**: An `UPDATE` statement for an `InnoDB` table could hang. The issue affects tables using the Barracuda file format and having multiple indexes on column prefixes. The size of an undo log record could exceed the page size, even though the total size of the column prefixes was less than the page size (usually 16KB). In MySQL 5.5 and higher, this error is now reported using the new code `ER_UNDO_RECORD_TOO_BIG`. In MySQL 5.1 with the InnoDB Plugin, this error is reported using the existing code `ER_TOO_BIG_ROWSIZE`. (Bug #12547647)
- **InnoDB**: This fix corrects cases where the MySQL server could hang or abort with a `long semaphore wait` message. (This is a different issue than when these symptoms occurred during a `CHECK TABLE` statement.) (Bug #11766591, Bug #59733)
- **Replication**: Issuing the following statements, in the order shown, could cause a deadlock between the user thread and I/O thread:

```
START SLAVE;
STOP SLAVE SQL_THREAD;
START SLAVE;
```

  (Bug #11878104)

References: See also Bug #44312, Bug #11752963, Bug #38715, Bug #38716.

- Internal conversion of zero to binary and back could yield a result with incorrect precision. (Bug #12911710)
- Valgrind warnings generated by `filesort` operations were fixed. (Bug #12856915)
- Several improvements were made to the `libedit` library bundled with MySQL distributions, and that is available for all platforms that MySQL supports except Windows.
  - Navigation keys did not work for UTF-8 input.
  - Word navigation and delete operations did not work for UTF-8 input with Cyrillic characters.
  - Nonlatin characters were corrupted in overwrite mode for UTF-8 input.
  - Long queries caused the statement history file to become corrupted.
  - The Alt key caused history operations to fail.

  (Bug #12605400, Bug #12613725, Bug #12618092, Bug #12624155, Bug #12617651, Bug #12605388)
- With Valgrind enabled, `InnoDB` semaphore wait timeouts were too low and could expire. (Bug #11765460)
- The help message for `mysql_install_db` did not indicate that it supports the `--defaults-file` [234], `--defaults-extra-file` [234] and `--no-defaults` [234] options. (Bug #58898, Bug #11765888)
- `myisampack` could create corrupt `FULLTEXT` indexes when compressing tables. (Bug #53646, Bug #11761180)
- An assertion designed to detect zero-length sort keys also was raised when the entire key set fit in memory. (Bug #58200, Bug #11765254)
- If MySQL was configured with `--without-plugin-innobase` and `--with-plugin-innodb_plugin`, to suppress building the built-in InnoDB storage engine and build the InnoDB Plugin instead, the `innochecksum` utility was not built. (Bug #47337, Bug #11755544)
- `OPTIMIZE TABLE` could corrupt `MyISAM` tables if `myisam_use_mmap` [504] was enabled. (Bug #49030, Bug #11757032)
- On Fedora, certain accesses to `/var/lib/mysql/HOSTNAME.err` were blocked by SELinux policy, which made the server fail at startup with the message: `Manager of pid-file quit without updating file` (Bug #37165, Bug #12927740)
- A linking problem prevented the `FEDERATED` storage engine plugin from loading. (Bug #40942, Bug #11750417)
- For `FEDERATED` tables, loss of connection to the remote table during some insert operations could cause a server crash. (Bug #34660, Bug #11747970)

Changes in MySQL 5.1.59 (2011-09-15)

Functionality Added or Changed

- If the `--with-ndbcluster` option is given to the `configure` script, it now produces a warning that the version of MySQL Cluster included in 5.1 is no longer maintained. (The separate MySQL Cluster distribution should be used instead.) (Bug #49093, Bug #11757091)

Bugs Fixed

- **Performance**: **InnoDB**: This fix improves the performance of operations on `VARCHAR(N)` columns in `InnoDB` tables, where `N` is declared as a large value but the actual string values in the table are short. (Bug #12835650)

- **Performance**: **InnoDB**: The `DROP TABLE` command for an `InnoDB` table could be very slow, in a configuration with a combination of table compression, partitioning, and a large buffer pool. (Bug #12635227, Bug #61188)

- **Performance**: **InnoDB**: The "random read-ahead" feature that was removed from the `InnoDB` Plugin is now available again. Because it is only helpful for certain workloads, it is turned off by default. To turn it on, enable the `innodb_random_read_ahead` configuration option. Because this feature can improve performance in some cases and reduce performance in others, before relying on this setting, benchmark both with and without the setting enabled. (Bug #12356373)

- **Incompatible Change**: Handling of a date-related assertion was modified.

  However, a consequence of this change is that several functions become more strict when passed a `DATE()` [982] function value as their argument and reject incomplete dates with a day part of zero. These functions are affected: `CONVERT_TZ()` [981], `DATE_ADD()` [983], `DATE_SUB()` [986], `DAYOFYEAR()` [987], `LAST_DAY()` [988], `TIMESTAMPDIFF()` [994], `TO_DAYS()` [994], `TO_SECONDS()`, `WEEK()` [996], `WEEKDAY()` [997], `WEEKOFYEAR()` [997], `YEARWEEK()` [997]. Because this changes date-handling behavior in General Availability-status series (MySQL 5.1 and 5.5), it was reverted in 5.1.62 and 5.5.21. The change is retained in MySQL 5.6.

  References: See also Bug #13458237.

- **InnoDB**: The `DATA_LENGTH` column in the `INFORMATION_SCHEMA.TABLES` table now correctly reports the on-disk sizes of tablespaces for `InnoDB` compressed tables. (Bug #12770537)

- **InnoDB**: With the configuration settings `innodb_file_per_table=1` [1367] and `innodb_file_format=Barracuda` [1366], inserting a column value greater than half the page size, and including that column in a secondary index, could cause a crash when that column value was updated. (Bug #12637786)

- **InnoDB**: Unused functions were removed from the internal `InnoDB` code related to mini-transactions, to clarify the logic. (Bug #12626794, Bug #61240)

- **InnoDB**: A `DROP TABLE` or `DROP INDEX` statement for an `InnoDB` table on a busy server could cause a crash or corrupt data in the buffer pool, if the buffer pool contained data from an `InnoDB` compressed table that was being accessed at the same time. (The crash could occur whether or not the table being dropped used compression.) (Bug #11765566, Bug #58549)

- **Partitioning**: Auto-increment columns of partitioned tables were checked even when they were not being written to. In debug builds, this could lead to a server crash. (Bug #11765667, Bug #58655)

- **Replication**: Processing of corrupted table map events could cause the server to crash. This was especially likely if the events mapped different tables to the same identifier, such as could happen due to Bug #56226.

  Now, before applying a table map event, the server checks whether the table has already been mapped with different settings, and if so, an error is raised and the slave SQL thread stops. If it has been mapped with the same settings, or if the table is set to be ignored by filtering rules, there is no change in behavior: the event is skipped and IDs are not checked. (Bug #44360, Bug #11753004)

  References: See also Bug #11763509.

- The option-parsing code for empty strings leaked memory. (Bug #12589928)

- `ALTER TABLE {MODIFY|CHANGE} ... FIRST` did nothing except rename columns if the old and new versions of the table had exactly the same structure with respect to column data types. As a result, the mapping of column name to column data was incorrect. The same thing happened for

`ALTER TABLE DROP COLUMN ... ADD COLUMN` statements intended to produce a new version of the table with exactly the same structure as the old version. (Bug #61493, Bug #12652385)

- For a `lower_case_table_names` [492] value of 1 or 2 and a database having a mixed-case name, calling a stored function using a fully qualified name including the database name failed. (Bug #60347, Bug #11840395)
- For `MyISAM` tables, attempts to insert incorrect data into an indexed `GEOMETRY` column could result in table corruption. (Bug #57323, Bug #11764487)
- `SELECT DISTINCT` with a deterministic stored function in the `WHERE` clause could produce incorrect results. (Bug #59736, Bug #11766594)
- A race condition between loading a stored routine using the name qualified by the database name and dropping that database resulted in a spurious error message: `The table mysql.proc is missing, corrupt, or contains bad data` (Bug #47870, Bug #11756013)
- Upgrades using an RPM package recreated the `test` database, which is undesirable when the DBA had removed it. (Bug #45415, Bug #11753896)
- `CREATE TABLE` without an `ENGINE` option determined the default engine at parse rather than execution time. This led to incorrect results if the statement was executed within a stored program and the default engine had been changed in the meantime. (Bug #50614, Bug #11758414)

Changes in MySQL 5.1.58 (2011-07-05)

Bugs Fixed

- **InnoDB**: If the server crashed while an XA transaction was prepared but not yet committed, the transaction could remain in the system after restart, and cause a subsequent shutdown to hang. (Bug #11766513, Bug #59641)
- **Partitioning**: When executing a row-ordered retrieval index merge, the partitioning handler used memory from that allocated for the table, rather than that allocated to the query, causing table object memory not to be freed until the table was closed. (Bug #11766249, Bug #59316)
- **Replication**: When `mysqlbinlog` was invoked using `--base64-output=decode-row` [349] and `--start-position=`*`pos`* [353], (where *`pos`* is a point in the binary log past the format description log event), a spurious error of the type shown here was generated:

  ```
  malformed binlog: it does not contain any Format_description_log_event...
  ```

  However, since there is nothing unsafe about not printing the format description log event, the error has been removed for this case. (Bug #12354268)
- **Replication**: Typographical errors appeared in the text of several replication error messages. (The word “position” was misspelled as “postion”.) (Bug #11762616, Bug #55229)
- After the fix for Bug #11889186, `MAKEDATE()` [989] arguments with a year part greater than 9999 raised an assertion. (Bug #12403504)
- An assertion could be raised due to a missing `NULL` value check in `Item_func_round::fix_length_and_dec()`. (Bug #12392636)
- In debug builds on Solaris, an assertion was raised if a reverse IP lookup with `gethostbyaddr_r()` failed. (Bug #12377872)
- MySQL did not build if configured with both `--with-debug` and `--with-libedit`. (Bug #12329909)
- `LOAD DATA INFILE` errors could leak I/O cache memory. (Bug #58072, Bug #11765141)

- In `Item_func_in::fix_length_and_dec()`, a Valgrind warning for uninitialized values was corrected. (Bug #59270, Bug #11766212)
- An incorrect `max_length` value for `YEAR` values could be used in temporary result tables for `UNION`, leading to incorrect results. (Bug #59343, Bug #11766270)
- For `LOAD DATA INFILE`, multi-byte character sequences could be pushed onto a stack too small to accommodate them. (Bug #58069, Bug #11765139)
- In `ROUND()` [977] calculations, a Valgrind warning for uninitialized memory was corrected. (Bug #58937, Bug #11765923)

  References: This bug is a regression of Bug #33143.
- Valgrind warnings caused by comparing index values to an uninitialized field were corrected. (Bug #58705, Bug #11765713)
- In debug builds, `Field_new_decimal::store_value()` was subject to buffer overflows. (Bug #55436, Bug #11762799)
- An embedded client aborted rather than issuing an error message if it issued a `TEE` command (`\T` *`file_name`*) and the directory containing the file did not exist. This occurred because the wrong error handler was called. (Bug #57491, Bug #11764633)
- Using `CREATE EVENT IF NOT EXISTS` for an event that already existed and was enabled caused multiple instances of the event to run. (Bug #61005, Bug #12546938)
- A problem introduced in MySQL 5.1.57 caused very old (MySQL 4.0) clients to be unable to connect to the server. (Bug #61222, Bug #12563279)
- `ALTER EVENT` could change the event status. (Bug #57156, Bug #11764334)
- Compilation failed on AIX due to a missing `bzero()` prototype. (Bug #55721, Bug #11763056)
- The optimizer sometimes incorrectly processed `HAVING` clauses for queries that did not also have an `ORDER BY` clause. (Bug #48916, Bug #11756928)
- `PROCEDURE ANALYSE()` could leak memory for `NULL` results, and could return incorrect results if used with a `LIMIT` clause. (Bug #48137, Bug #11756242)
- On Linux, the `mysql` client built using the bundled `libedit` did not read `~/.editrc`. (Bug #49967, Bug #11757855)
- On some platforms, the `Incorrect value: xxx for column yyy at row zzz` error produced by `LOAD DATA INFILE` could have an incorrect value of *`zzz`*. (Bug #46895, Bug #11755168)
- In MySQL 5.1 and up, if a table had triggers that used syntax supported in 5.0 but not 5.1, the table became unavailable. Now the table is marked as having broken triggers. These should be dropped and recreated manually. (Bug #45235, Bug #11753738)
- An attempt to install nonexistent files during installation was corrected. (Bug #43247, Bug #11752142)
- On FreeBSD 64-bit builds of the embedded server, exceptions were not prevented from propagating into the embedded application. (Bug #38965, Bug #11749418)

Changes in MySQL 5.1.57 (2011-05-05)

Functionality Added or Changed

- When invoked with the `--auto-generate-sql` [316] option, `mysqlslap` dropped the schema specified with the `--create-schema` [317] option at the end of the test run, which may have been

unexpected by the user. `mysqlslap` no longer drops the schema, but has a new `--create-and-drop-schema` [317] option that both creates and drops a schema. (Bug #58090, Bug #11765157)

- A new system variable, `max_long_data_size` [497], now controls the maximum size of parameter values that can be sent with the `mysql_stmt_send_long_data()` C API function. If not set at server startup, the default is the value of the `max_allowed_packet` [493] system variable. This variable is deprecated. In MySQL 5.6, it is removed and the maximum parameter size is controlled by `max_allowed_packet` [493].

Bugs Fixed

- **InnoDB**: **Replication**: Trying to update a column, previously set to `NULL`, of an `InnoDB` table with no primary key caused replication to fail with `Can't find record in 'table' on the slave`. (Bug #11766865, Bug #60091)

- **InnoDB**: The server could halt if `InnoDB` interpreted a very heavy I/O load for 15 minutes or more as an indication that the server was hung. This change fixes the logic that measures how long `InnoDB` threads were waiting, which formerly could produce false positives. (Bug #11877216, Bug #11755413, Bug #47183)

- **InnoDB**: The MySQL server could hang during `CREATE TABLE`, `OPTIMIZE TABLE`, or `ALTER TABLE` or other DDL operation that performs a table copy for an `InnoDB` table, if such operations were performed by multiple sessions simultaneously. The error was reported as:

  ```
  InnoDB: Error: semaphore wait has lasted > 600 seconds
  ```

  (Bug #11760042, Bug #52409)

- **Partitioning**: A problem with a previous fix for poor performance of `INSERT ON DUPLICATE KEY UPDATE` statements on tables having many partitions caused the handler function for reading a row from a specific index to fail to store the ID of the partition last used. This caused some statements to fail with `Can't find record` errors. (Bug #59297, Bug #11766232)

  References: This bug is a regression of Bug #52455.

- **Replication**: Using the `--server-id` [353] option with `mysqlbinlog` could cause format description log events to be filtered from the binary log, leaving `mysqlbinlog` unable to read the remainder of the log. Now such events are always read without regard to the value of this option.

  As part of the the fix for this problem, `mysqlbinlog` now also reads rotate log events without regard to the value of `--server-id` [353]. (Bug #59530, Bug #11766427)

- `InnoDB` invoked some `zlib` functions without proper initialization. (Bug #11849231)

- Two unused test files in `storage/ndb/test/sql` contained incorrect versions of the GNU Lesser General Public License. The files and the directory containing them have been removed. (Bug #11810224)

  References: See also Bug #11810156.

- The server read one byte too many when trying to process an XML string lacking a closing single quote (') or double quote (") character used as an argument for `UpdateXML()` [1018] or `ExtractValue()` [1016]. (Bug #59901, Bug #11766725)

  References: See also Bug #44332, Bug #11752979.

- Aggregation followed by a subquery could produce an incorrect result. (Bug #59839, Bug #11766675)

- `mysqldump` did not quote database names in `ALTER DATABASE` statements in its output, which could cause an error at reload time for database names containing a dash. (Bug #59398, Bug #11766310)

- Attempting to create a spatial index on a `CHAR` column longer than 31 bytes led to an assertion failure if the server was compiled with safemutex support. (Bug #59888, Bug #11766714)
- An incorrect character set pointer passed to `my_strtoll10_mb2()` caused an assertion to be raised. (Bug #59648, Bug #11766519)
- The code for `PROCEDURE ANALYSE()` had a missing `DBUG_RETURN` statement, which could cause a server crash in debug builds. (Bug #58140, Bug #11765202)
- In `Item::get_date`, a Valgrind warning for a missing `NULL` value check was corrected. (Bug #59164, Bug #11766124)
- In `Item_func_month::val_str()`, a Valgrind warning for a too-late `NULL` value check was corrected. (Bug #59166, Bug #11766126)
- In `Item_func::val_decimal`, a Valgrind warning for a missing `NULL` value check was corrected. (Bug #59125, Bug #11766087)
- In `Item_func_str_to_date::val_str`, a Valgrind warning for an uninitialized variable was corrected. (Bug #58154, Bug #11765216)
- In `extract_date_time()`, a Valgrind warning for a missing end-of-string check was corrected. (Bug #59151, Bug #11766112)
- A missing variable initialization for `Item_func_set_user_var` objects could raise an assertion. (Bug #59527, Bug #11766424)
- In string context, the `MIN()` [1047] and `MAX()` [1046] functions did not take into account the unsignedness of a `BIGINT UNSIGNED` argument. (Bug #59132, Bug #11766094)
- An assertion could be raised if a statement that required a name lock on a table (for example, `DROP TRIGGER`) executed concurrently with an `INFORMATION_SCHEMA` query that also used the table. (Bug #56541, Bug #11763784)
- An assertion could be raised in `Item_func_int_val::fix_num_length_and_dec()` due to overflow for geometry functions. (Bug #57900, Bug #11764994)
- The server permitted `max_allowed_packet` [493] to be set lower than `net_buffer_length` [505], which does not make sense because `max_allowed_packet` [493] is the upper limit on `net_buffer_length` [505] values. Now a warning occurs and the value remains unchanged. (Bug #59959, Bug #11766769)
- Selecting from a view for which the definition included a `HAVING` clause failed with an error:

```
1356: View '...' references invalid table(s) or column(s)
or function(s) or definer/invoker of view lack rights to use them
```

  (Bug #60295, Bug #11829681)
- A potential invalid memory access discovered by Valgrind was fixed. (Bug #48053, Bug #11756169)
- For a client connected using SSL, the `Ssl_cipher_list` [569] status variable was empty and did not show the possible cipher types. (Bug #52596, Bug #11760210)
- With `lower_case_table_names=2` [492], resolution of objects qualified by database names could fail. (Bug #50924, Bug #11758687)
- `SHOW EVENTS` did not always show events from the correct database. (Bug #41907, Bug #11751148)
- Bitmap functions used in one thread could change bitmaps used by other threads, raising an assertion. (Bug #43152, Bug #11752069)

Changes in MySQL 5.1.56 (2011-03-01)

Functionality Added or Changed

- `mysqldump --xml` now displays comments from column definitions. (Bug #13618, Bug #11745324)

Bugs Fixed

- **Security Fix**: Bug #36544 was fixed.
- **InnoDB**: `InnoDB` returned values for "rows examined" in the query plan that were higher than expected. `NULL` values were treated in an inconsistent way. The inaccurate statistics could trigger "false positives" in combination with the `max_join_size` [496] setting, because the queries did not really examine as many rows as reported.

  A new configuration option `innodb_stats_method` lets you specify how `NULL` values are treated when calculating index statistics. Allowed values are `nulls_equal` (the default), `nulls_unequal` and `null_ignored`. The meanings of these values are similar to those of the `myisam_stats_method` [503] option. (Bug #30423)
- **Partitioning**: Trying to use the same column more than once in the partitioning key when partitioning a table by `KEY` caused `mysqld` to crash. Such duplication of key columns is now expressly disallowed, and fails with an appropriate error. (Bug #53354, Bug #57924)
- **Replication**: When using the statement-based logging format, `INSERT ON DUPLICATE KEY UPDATE` and `INSERT IGNORE` statements affecting transactional tables that did not fail were not written to the binary log if they did not insert any rows. (With statement-based logging, all successful statements should be logged, whether they do or do not cause any rows to be changed.) (Bug #59338, Bug #11766266)
- **Replication**: Formerly, `STOP SLAVE` stopped the slave I/O thread first and then stopped the slave SQL thread; thus, it was possible for the I/O thread to stop after replicating only part of a transaction which the SQL thread was executing, in which case—if the transaction could not be rolled back safely—the SQL thread could hang.

  Now, `STOP SLAVE` stops the slave SQL thread first and then stops the I/O thread; this guarantees that the I/O thread can fetch any remaining events in the transaction that the SQL thread is executing, so that the SQL thread can finish the transaction if it cannot be rolled back safely. (Bug #58546, Bug #11765563)
- When `mysqladmin` was run with the `--sleep` [281] and `--count` [280] options, it went into an infinite loop executing the specified command. (Bug #58221, Bug #11765270)
- `mysqlslap` failed to check for a `NULL` return from `mysql_store_result()` and crashed trying to process the result set. (Bug #59109, Bug #11766074)
- `DELETE` or `UPDATE` statements could fail if they used `DATE` or `DATETIME` values with a year, month, or day part of zero. (Bug #59173)
- In debug builds, `SUBSTRING_INDEX(FORMAT(...), FORMAT(...))` could cause a server crash. (Bug #58371, Bug #11765406)
- The `ESCAPE` clause for the `LIKE` [959] operator permits only expressions that evaluate to a constant at execution time, but aggregate functions were not being rejected. (Bug #59149, Bug #11766110)
- The `mysql` client went into an infinite loop if the standard input was a directory. (Bug #57450, Bug #11764598)
- The expression *`const1`* `BETWEEN` *`const2`* `AND` *`field`* was optimized incorrectly and produced incorrect results. (Bug #57030, Bug #11764215)
- A query of the following form returned an incorrect result, where the values for *`col_name`* in the result set were entirely replaced with `NULL` values:

```
SELECT DISTINCT col_name ... ORDER BY col_name DESC;
```

(Bug #59308, Bug #11766241)

- Memory leaks detected by Valgrind, some of which could cause incorrect query results, were corrected. (Bug #59110, Bug #11766075)
- Some string-manipulating SQL functions use a shared string object intended to contain an immutable empty string. This object was used by the SQL function `SUBSTRING_INDEX()` [958] to return an empty string when one argument was of the wrong data type. If the string object was then modified by the SQL function `INSERT()` [953], undefined behavior ensued. (Bug #58165, Bug #11765225)
- Some RPM installation scripts used a hardcoded value for the data directory, which could result in a failed installation for users who have a nonstandard data directory location. The same was true for other configuration values such as the PID file name. (Bug #56581, Bug #11763817)
- On FreeBSD and OpenBSD, the server incorrectly checked the range of the system date, causing legal values to be rejected. (Bug #55755, Bug #11763089)
- Parsing nested regular expressions could lead to recursion resulting in a stack overflow crash. (Bug #58026, Bug #11765099)
- When using `ExtractValue()` [1016] or `UpdateXML()` [1018], if the XML to be read contained an incomplete XML comment, MySQL read beyond the end of the XML string when processing, leading to a crash of the server. (Bug #44332, Bug #11752979)

Changes in MySQL 5.1.55 (2011-02-07)

Functionality Added or Changed

- The time zone tables available at http://dev.mysql.com/downloads/timezones.html have been updated. These tables can be used on systems such as Windows or HP-UX that do not include zoneinfo files. (Bug #40230)

Bugs Fixed

- **Security Fix**: Bug #57952 was fixed.
- **Performance**: **InnoDB**: An `UPDATE` statement for an `InnoDB` table could be slower than necessary if it changed a column covered by a prefix index, but did not change the prefix portion of the value. The fix improves performance for InnoDB 1.1 in MySQL 5.5 and higher, and the InnoDB Plugin for MySQL 5.1. (Bug #58912, Bug #11765900)
- **Performance**: Queries involving `InnoDB` tables in the `INFORMATION_SCHEMA` tables `TABLE_CONSTRAINTS`, `KEY_COLUMN_USAGE`, or `REFERENTIAL_CONSTRAINTS` were slower than necessary because statistics were rechecked more often than required, even more so when many foreign keys were present. The improvement to this may be of particular benefit to users of MySQL Enterprise Monitor with many monitored servers or tens of thousands of tables. (Bug #43818, Bug #11752585)
- **Incompatible Change**: When `auto_increment_increment` is greater than one, values generated by a bulk insert that reaches the maximum column value could wrap around rather producing an overflow error.

  As a consequence of the fix, it is no longer possible for an auto-generated value to be equal to the maximum `BIGINT UNSIGNED` value. It is still possible to store that value manually, if the column can accept it. (Bug #39828, Bug #11749800)
- **Important Change**: **Partitioning**: Date and time functions used as partitioning functions now have the types of their operands checked; use of a value of the wrong type is now disallowed in

such cases. In addition, `EXTRACT(WEEK FROM col_name)` [987], where *`col_name`* is a `DATE` or `DATETIME` column, is now disallowed altogether because its return value depends on the value of the `default_week_format` [470] system variable. (Bug #54483, Bug #11761948)

References: See also Bug #57071, Bug #11764255.

- **InnoDB**: The server could crash with an assertion error, if a stored procedure, stored function, or trigger modified one `InnoDB` table containing an auto-increment column, and dropped another `InnoDB` table containing an auto-increment column. (Bug #56228)
- **InnoDB**: In `InnoDB` status output, the value for `I/O sum[]` could be incorrect, displayed as a very large number. (Bug #57600)
- **InnoDB**: It was not possible to query the `information_schema.INNODB_TRX` table while other connections were running queries involving `BLOB` types. (Bug #55397, Bug #11762763)
- **InnoDB**: The presence of a double quotation mark inside the `COMMENT` field for a column could prevent a foreign key constraint from being created properly. (Bug #59197, Bug #11766154)
- **InnoDB**: A compilation problem affected the `InnoDB` source code on NetBSD/sparc64. (Bug #59327)

  References: See also Bug #53916.
- **InnoDB**: The `OPTIMIZE TABLE` statement reset the auto-increment counter for an `InnoDB` table. Now the auto-increment value is preserved across this operation. (Bug #18274)
- **Partitioning**: Failed `ALTER TABLE ... PARTITION` statements could cause memory leaks. (Bug #56380, Bug #11763641)

  References: See also Bug #46949, Bug #11755209, Bug #56996, Bug #11764187.
- **Replication**: When closing a session that used temporary tables, binary logging could sometimes fail with a spurious `Failed to write the DROP statement for temporary tables to binary log`. (Bug #57288)
- **Replication**: By default, a value is generated for an `AUTO_INCREMENT` column by inserting either `NULL` or 0 into the column. Setting the `NO_AUTO_VALUE_ON_ZERO` [573] server SQL mode suppresses this behavior for 0, so that it occurs only when `NULL` is inserted into the column.

  This behavior is also followed on a replication slave (by the slave SQL thread) when applying events that have been logged on the master using the statement-based format. However, when applying events that had been logged using the row-based format, `NO_AUTO_VALUE_ON_ZERO` [573] was ignored, which could lead to an assertion.

  To fix this issue, the value of an `AUTO_INCREMENT` column is no longer generated when applying an event that was logged using the row-based row format, as this value is already contained in the changes applied on the slave. (Bug #56662)
- **Replication**: The `BINLOG` statement modified the values of session variables, which could lead to problems with operations such as point-in-time recovery. One such case occurred when replaying a row-based binary log which relied on setting `foreign_key_checks = OFF` [475] at the session level to create and populate a set of `InnoDB` tables having foreign key constraints. (Bug #54903)
- **Replication**: `mysqlbinlog` printed `USE` statements to its output only when the default database changed between events. To illustrate how this could cause problems, suppose that a user issued the following sequence of statements:

```
CREATE DATABASE mydb;
USE mydb;
CREATE TABLE mytable (column_definitions);
DROP DATABASE mydb;
```

```
CREATE DATABASE mydb;
USE mydb;
CREATE TABLE mytable (column_definitions);
```

When played back using `mysqlbinlog`, the second `CREATE TABLE` statement failed with `Error: No Database Selected` because the second `USE` statement was not played back, due to the fact that a database other than `mydb` was never selected.

This fix ensures that `mysqlbinlog` outputs a `USE` statement whenever it reads one from the binary log. (Bug #50914, Bug #11758677)

- **Replication**: When an error occurred in the generation of the name for a new binary log file, the error was logged but not shown to the user. (Bug #46166)

  References: See also Bug #37148, Bug #11748696, Bug #40611, Bug #11750196, Bug #43929, Bug #51019.

- **Replication**: Previously, when a statement failed with a different error on the slave than on the master, the slave SQL thread displayed a message containing:

  - The error message for the master error code
  - The master error code
  - The error message for the slaves error code
  - The slave error code

  However, the slave has no information with which to fill in any print format specifiers for the master message, so it actually displayed the message format string. To make it clearer that the slave is not displaying the actual message as it appears on the master, the slave now indicates that the master part of the output is the message format, not the actual message. For example, previously the slave displayed information like this:

  ```
  Error: "Query caused different errors on master and slave. Error
  on master: 'Duplicate entry '%-.192s' for key %d' (1062), Error on
  slave: 'no error' (0). Default database: 'test'. Query: 'insert
  into t1 values(1),(2)'" (expected different error codes on master
  and slave)
  ```

  Now the slave displays this:

  ```
  Error: "Query caused different errors on master and slave. Error
  on master: message format='Duplicate entry '%-.192s' for key %d'
  error code=1062 ; Error on slave: actual message='no error', error
  code=0. Default database: 'test'. Query: 'insert into t1 values(1),(2)'"
  (expected different error codes on master and slave)
  ```

  (Bug #46697)

- Issuing `EXPLAIN EXTENDED` for a query that would use condition pushdown could cause `mysqld` to crash. (Bug #58553, Bug #11765570)

- `CREATE DATABASE` and `DROP DATABASE` caused `mysql --one-database` to lose track of the statement-filtering context. (Bug #54899)

- Configuration with maintainer mode enabled resulted in errors when compiling with `icc`. (Bug #57991, Bug #58871)

- The `cp1251` character set did not properly support the Euro sign (`0x88`). For example, converting a string containing this character to `utf8` resulted in `'?'` rather than the `utf8` Euro sign. (Bug #56639)

- View creation could produce Valgrind warnings. (Bug #57352)

- Some unsigned system variables could be displayed with negative values. (Bug #55794)
- An assertion could be raised during concurrent execution of `DROP DATABASE` and `REPAIR TABLE` if the drop deleted a table's `.TMD` file at the same time the repair tried to read details from the old file that was just removed.

  A problem could also occur when `DROP TABLE` tried to remove all files belonging to a table at the same time `REPAIR TABLE` had just deleted the table's `.TMD` file. (Bug #54486)
- `EXPLAIN` could crash for queries that used `GROUP_CONCAT()` [1046]. (Bug #58396)
- Unnecessary subquery evaluation in contexts such as statement preparation or view creation could cause a server crash. (Bug #57703)
- `MIN(year_col)` [1047] could return an incorrect result in some cases. (Bug #59211, Bug #11766165)
- If `max_allowed_packet` was set larger than 16MB, the server failed to reject too-large packets with “Packet too large” errors. (Bug #58887, Bug #11765878)
- `NULL` geometry values could cause a crash in `Item_func_spatial_collection::fix_length_and_dec`. (Bug #57321)
- If a client supplied a user name longer than the maximum 16 characters permitted for names stored in the MySQL grant tables, all characters were being considered significant when checking for a match. Historically, only the first 16 characters were used for matching; this behavior was restored. (Bug #49752)
- An assertion could be raised if –1 was inserted into an `AUTO_INCREMENT` column by a statement writing more than one row. (Bug #50619, Bug #11758417)
- When `mysqld` printed crash dump information, it incorrectly indicated that some valid pointers were invalid. (Bug #51817)
- On FreeBSD, if `mysqld` was killed with a `SIGHUP` signal, it could corrupt `InnoDB .ibd` files. (Bug #51023, Bug #11758773)
- The `my_seek()` and `my_tell()` functions ignored the `MY_WME` flag when they returned an error, which could cause client programs to hang. (Bug #48451)
- During assignment of values to system variables, legality checks on the value range occurred too late, preventing proper error checking. (Bug #43233)
- On Solaris, time-related functions such as `NOW()` [990] or `SYSDATE()` [992] could return a constant value. (Bug #42054)
- If the remote server for a `FEDERATED` table could not be accessed, queries for the `INFORMATION_SCHEMA.TABLES` table failed. (Bug #35333)

Changes in MySQL 5.1.54 (2010-11-26)

Functionality Added or Changed

- The `pstack` library was nonfunctional and has been removed, along with the `--with-pstack` option for `configure`. The `--enable-pstack` option for `mysqld` is deprecated and will be removed in MySQL 5.5. (Bug #57210)
- Support for the `IBMDB2I` storage engine has been removed. (Bug #58079)

Bugs Fixed

- **Security Fix**: Bug #58005 was fixed.

- **Performance**: **InnoDB**: Improved concurrency when several `ANALYZE TABLE` or `SHOW TABLE STATUS` statements are run simultaneously for `InnoDB` tables. (Bug #53046)

- **InnoDB**: Dropping an `InnoDB` index used by a foreign key constraint, while `foreign_key_checks` was set to 0, could cause the server to crash with an assertion. This operation now does not cause a crash. The foreign key constraint can no longer be enforced once the associated index is removed, so do not rely on it for referential integrity in this case. (Bug #11762483, Bug #55084)

- **InnoDB**: If the MySQL Server crashed immediately after creating an `InnoDB` table, the server could quit with a `signal 11` during the subsequent restart. The issue could occur if the server halted after `InnoDB` created the primary index for the table, but before the index definition was recorded in the MySQL metadata. (Bug #57616)

  References: This bug is a regression of Bug #54582.

- **InnoDB**: For an `InnoDB` table created with `ROW_FORMAT=COMPRESSED` or `ROW_FORMAT=DYNAMIC`, a query using the `READ UNCOMMITTED` isolation level could cause the server to stop with an assertion error, if `BLOB` or other large columns that use off-page storage were being inserted at the same time. (Bug #57799)

- **InnoDB**: An existing `InnoDB` table could be switched to `ROW_FORMAT=COMPRESSED` implicitly by a `KEY_BLOCK_SIZE` clause in an `ALTER TABLE` statement. Now, the row format is only switched to compressed if there is an explicit `ROW_FORMAT=COMPRESSED` clause. on the `ALTER TABLE` statement.

  Any valid, nondefault `ROW_FORMAT` parameter takes precedence over `KEY_BLOCK_SIZE` when both are specified. `KEY_BLOCK_SIZE` only enables `ROW_FORMAT=COMPRESSED` if `ROW_FORMAT` is not specified on either the `CREATE TABLE` or `ALTER TABLE` statement, or is specified as `DEFAULT`. In case of a conflict between `KEY_BLOCK_SIZE` and `ROW_FORMAT` clauses, the `KEY_BLOCK_SIZE` is ignored if `innodb_strict_mode` is off, and the statement causes an error if `innodb_strict_mode` is on. (Bug #56632)

- **InnoDB**: The clause `KEY_BLOCK_SIZE=0` is now permitted on `CREATE TABLE` and `ALTER TABLE` statements for `InnoDB` tables, regardless of the setting of `innodb_strict_mode` [1382]. The zero value has the effect of resetting the `KEY_BLOCK_SIZE` table parameter to its default value, depending on the `ROW_FORMAT` parameter, as if it had not been specified. That default is 8 if `ROW_FORMAT=COMPRESSED`. Otherwise, `KEY_BLOCK_SIZE` is not used or stored with the table parameters.

  As a consequence of this fix, `ROW_FORMAT=FIXED` is not permitted when `innodb_strict_mode` [1382] is enabled. (Bug #56628)

- **InnoDB**: `InnoDB` startup messages now include the start and end times for buffer pool initialization, and the total buffer pool size. (Bug #48026)

- **Partitioning**: In debug builds, an `INSERT ... ON DUPLICATE KEY UPDATE col_name = 0` statement on an `AUTO_INCREMENT` column caused the server to crash. (Bug #57890)

- **Partitioning**: An `ALTER TABLE` statement acting on table partitions that failed while the affected table was locked could cause the server to crash. (Bug #56172)

- Passing a string that was not null-terminated to `UpdateXML()` [1018] or `ExtractValue()` [1016] caused the server to fail with an assertion. (Bug #57279, Bug #11764447)

- Several compilation problems were fixed. (Bug #57992, Bug #57993, Bug #57994, Bug #57995, Bug #57996, Bug #57997, Bug #58057)

- Queries executed using the Index Merge access method and a temporary file could return incorrect results. (Bug #56862)

- An error in a stored procedure could leave the session in a different default database. (Bug #54375)

- Valgrind warnings about overlapping memory when double-assigning the same variable were corrected. (Bug #56138)
- The `find_files()` function used by `SHOW` statements performed redundant and unnecessary memory allocation. (Bug #51208)
- Grouping by a `TIME_TO_SEC()` [994] function result could cause a server crash or incorrect results. Grouping by a function returning a `BLOB` could cause an unexpected “Duplicate entry” error and incorrect result. (Bug #52160)
- The Windows sample option files contained values more appropriate for Linux. (Bug #50021)
- A failed `RENAME TABLE` operation could prevent a `FLUSH TABLES WITH READ LOCK` from completing. (Bug #47924)

Changes in MySQL 5.1.53 (2010-11-03)

Bugs Fixed

- **InnoDB**: **Security Fix**: A failed `CREATE TABLE` statement for an `InnoDB` table could allocate memory that was never freed. (Bug #56947)
- **Security Fix**: Bug #55146 and Bug #56287 were fixed.
- **Security Fix**: Bug #56814 was fixed.
- **Security Fix**: Bug #54484 was fixed.
- **Security Fix**: Bug #57272 was fixed.
- **Security Fix**: Bug #57477 was fixed.
- **InnoDB**: The `InnoDB` system tablespace could grow continually for a server under heavy load. (Bug #57611)
- **InnoDB**: A followup fix to bug #54678. `TRUNCATE TABLE` could still cause a crash (assertion error) in the debug version of the server. (Bug #57700)
- **InnoDB**: A large number of foreign key declarations could cause the output of the `SHOW CREATE STATEMENT` statement to be truncated. (Bug #56143)
- **InnoDB**: If the server crashed during an `ALTER TABLE` operation on an `InnoDB` table, examining the table through `SHOW CREATE TABLE` or querying the `INFORMATION_SCHEMA` tables could cause the server to stop with an assertion error. (Bug #56982)
- **InnoDB**: A compilation problem affected the `InnoDB` source code on NetBSD/sparc64. (Bug #53916)

  References: See also Bug #59327.
- **InnoDB**: Turning off the `innodb_stats_on_metadata` [1381] option could prevent the `ANALYZE TABLE` statement from updating the cardinality statistics of `InnoDB` tables. (Bug #57252)
- **InnoDB**: A query for an `InnoDB` table could return the wrong value if a column value was changed to a different case, and the column had a case-insensitive index. (Bug #56680)
- **Replication**: If there exist both a temporary table and a nontemporary table having the same name, updates normally apply only to the temporary table, with the exception of a `CREATE TABLE ... SELECT` statement that creates a nontemporary table having the same name as an existing temporary table. When such a statement was replicated using the `MIXED` logging format, and the statement was unsafe for row-based logging, updates were misapplied to the temporary table. (Bug #55478)

References: See also Bug #47899, Bug #55709.

- **Replication**: An `ALTER TABLE` statement that altered a column of a `MyISAM` table without setting the column's size caused the binary log to become corrupted when the table map was unexpectedly set to 0 by updates (including deletes) on multiple tables, leading to replication failure when more than one table received the same table map ID. (Bug #56226, Bug #11763509)

- **Replication**: When `STOP SLAVE` is issued, the slave SQL thread rolls back the current transaction and stops immediately if the transaction updates only tables which use transactional storage engines. Previously, this occurred even when the transaction contained `CREATE TEMPORARY TABLE` statements, `DROP TEMPORARY TABLE` statements, or both, although these statements cannot be rolled back. Because temporary tables persist for the lifetime of a user session (in the case, the replication user), they remain until the slave is stopped or reset. When the transaction is restarted following a subsequent `START SLAVE` statement, the SQL thread aborts with an error that a temporary table to be created (or dropped) already exists (or does not exist, in the latter case).

  Following this fix, if an ongoing transaction contains `CREATE TEMPORARY TABLE` statements, `DROP TEMPORARY TABLE` statements, or both, the SQL thread now waits until the transaction ends, then stops. (Bug #56118, Bug #11763416)

- **Replication**: When making changes to relay log settings using `CHANGE MASTER TO`, the I/O cache was not cleared. This could result in replication failure when the slave attempted to read stale data from the cache and then stopped with an assertion. (Bug #55263)

- **Replication**: `SET PASSWORD` caused failure of row-based replication between a MySQL 5.1 master and a MySQL 5.5 slave.

  This fix makes it possible to replicate `SET PASSWORD` correctly, using row-based replication between a master running MySQL 5.1.53 or a later MySQL 5.1 release to a slave running MySQL 5.5.7 or a later MySQL 5.5 release. (Bug #57098)

  References: See also Bug #55452, Bug #57357.

- **Replication**: When a slave tried to execute a transaction larger than the slave's value for `max_binlog_cache_size` [1656], it crashed. This was caused by an assertion that the server should roll back only the statement but not the entire transaction when the error `ER_TRANS_CACHE_FULL` [3969] occurred. However, the slave SQL thread always rolled back the entire transaction whenever any error occurred, regardless of the type of error. (Bug #55375)

- **Replication**: Trying to read from a binary log containing a log event of an invalid type caused the slave to crash. (Bug #38718)

- **Replication**: When replicating the `mysql.tables_priv` table, the `Grantor` column was not replicated, and was thus left empty on the slave. (Bug #27606)

- `SET GLOBAL debug` could cause a crash on Solaris if the server failed to open the trace file. (Bug #57274)

- A `SELECT` statement could produce a number of rows different from a `CREATE TABLE ... SELECT` that was supposed to select the same rows. (Bug #56423)

  References: This bug is a regression of Bug #38999.

- On file systems with case insensitive file names, and `lower_case_table_names=2` [492], the server could crash due to a table definition cache inconsistency. (Bug #46941)

- Handling of host name lettercase in `GRANT` statements was inconsistent. (Bug #36742)

Changes in MySQL Enterprise 5.1.52sp1 [QSP] (2011-02-21)

This is a *Service Pack* release of the MySQL Enterprise Server 5.1.

Functionality Added or Changed

- Support for the `IBMDB2I` storage engine has been removed. (Bug #58079)

Bugs Fixed

- **Incompatible Change**: When `auto_increment_increment` is greater than one, values generated by a bulk insert that reaches the maximum column value could wrap around rather producing an overflow error.

  As a consequence of the fix, it is no longer possible for an auto-generated value to be equal to the maximum `BIGINT UNSIGNED` value. It is still possible to store that value manually, if the column can accept it. (Bug #39828, Bug #11749800)

- **Important Change**: **Partitioning**: Date and time functions used as partitioning functions now have the types of their operands checked; use of a value of the wrong type is now disallowed in such cases. In addition, `EXTRACT(WEEK FROM col_name)` [987], where *`col_name`* is a `DATE` or `DATETIME` column, is now disallowed altogether because its return value depends on the value of the `default_week_format` [470] system variable. (Bug #54483, Bug #11761948)

  References: See also Bug #57071, Bug #11764255.

- **InnoDB**: The `InnoDB` system tablespace could grow continually for a server under heavy load. (Bug #57611)

- **InnoDB**: If the server crashed during an `ALTER TABLE` operation on an `InnoDB` table, examining the table through `SHOW CREATE TABLE` or querying the `INFORMATION_SCHEMA` tables could cause the server to stop with an assertion error. (Bug #56982)

- **Partitioning**: Failed `ALTER TABLE ... PARTITION` statements could cause memory leaks. (Bug #56380, Bug #11763641)

  References: See also Bug #46949, Bug #11755209, Bug #56996, Bug #11764187.

- `SET GLOBAL debug` could cause a crash on Solaris if the server failed to open the trace file. (Bug #57274)

- Valgrind warnings about overlapping memory when double-assigning the same variable were corrected. (Bug #56138)

- View creation could produce Valgrind warnings. (Bug #57352)

- `EXPLAIN` could crash for queries that used `GROUP_CONCAT()` [1046]. (Bug #58396)

- Unnecessary subquery evaluation in contexts such as statement preparation or view creation could cause a server crash. (Bug #57703)

- `MIN(year_col)` [1047] could return an incorrect result in some cases. (Bug #59211, Bug #11766165)

- `NULL` geometry values could cause a crash in `Item_func_spatial_collection::fix_length_and_dec`. (Bug #57321)

- On FreeBSD, if `mysqld` was killed with a `SIGHUP` signal, it could corrupt `InnoDB .ibd` files. (Bug #51023, Bug #11758773)

Changes in MySQL 5.1.52 (2010-10-11)

Bugs Fixed

- **InnoDB**: **Security Fix**: Issuing `TRUNCATE TABLE` and examining the same table's information in the `INFORMATION_SCHEMA` database at the same time could cause a crash in the debug version of the server. (Bug #54678)

- **Security Fix**: In prepared-statement mode, `EXPLAIN` for a `SELECT` from a derived table caused a server crash. (Bug #54488)
- **Security Fix**: `EXPLAIN EXTENDED` caused a server crash with some prepared statements. (Bug #54494)
- **Security Fix**: The server crashed for assignment of values of types other than `Geometry` to items of type `GeometryCollection` (`MultiPoint`, `MultiCurve`, `MultiSurface`). Now the server checks the value type and fails with `bad geometry value` if it detects incorrect parameters. (Bug #55531)
- **Important Change**: **Replication**: The `LOAD DATA INFILE` statement is now considered unsafe for statement-based replication. When using statement-based logging mode, the statement now produces a warning; when using mixed-format logging, the statement is made using the row-based format. (Bug #34283)
- **InnoDB**: For an `InnoDB` table with an auto-increment column, the server could crash if the first statement that references the table after a server restart is a `SHOW CREATE TABLE` statement. (Bug #55277)
- **InnoDB**: Changed the locking mechanism for the `InnoDB` data dictionary during `ROLLBACK` operations, to improve concurrency for `REPLACE` statements. (Bug #54538)
- **InnoDB**: Improved the performance of `UPDATE` operations on `InnoDB` tables, when only non-indexed columns are changed. (Bug #56340)
- **InnoDB**: The server could crash with a high volume of concurrent `LOCK TABLES` and `UNLOCK TABLES` statements. (Bug #57345)
- **InnoDB**: The server could crash on shutdown, if started with `--innodb-use-system-malloc=0`. (Bug #55627)
- **InnoDB**: For debug builds, a `SELECT ... FOR UPDATE` statement affecting a range of rows in an `InnoDB` table could cause a server crash. (Bug #56716)
- **InnoDB**: `InnoDB` incorrectly reported an error when a cascading foreign key constraint deleted more than 250 rows. (Bug #57255)
- **InnoDB**: `InnoDB` transactions could be incorrectly committed during recovery, rather than rolled back, if the server crashed and was restarted after performing `ALTER TABLE ... ADD PRIMARY KEY` on an `InnoDB` table, or some other operation that involves copying the entire table. (Bug #53756)
- **InnoDB**: Setting the `PACK_KEYS=0` table option for an `InnoDB` table prevented new indexes from being added to the table. (Bug #54606)
- **Partitioning**: **Replication**: Attempting to execute `LOAD DATA` on a partitioned `MyISAM` table while using statement-based logging mode caused the master to hang or crash. (Bug #51851)
- **Partitioning**: Multiple-table `UPDATE` statements involving a partitioned `MyISAM` table could cause this table to become corrupted. Not all tables affected by the `UPDATE` needed to be partitioned for this issue to be observed. (Bug #55458)
- **Partitioning**: `EXPLAIN PARTITIONS` returned bad estimates for range queries on partitioned `MyISAM` tables. In addition, values in the `rows` column of `EXPLAIN PARTITIONS` output did not take partition pruning into account. (Bug #53806, Bug #46754)
- **Replication**: Backticks used to enclose identifiers for savepoints were not preserved in the binary log, which could lead to replication failure when the identifier, stripped of backticks, could be misinterpreted, causing a syntax or other error.

  This could cause problems with MySQL application programs making use of generated savepoint IDs. If, for instance, `java.sql.Connection.setSavepoint()` is called without any parameters,

Connector/J automatically generates a savepoint identifier consisting of a string of hexadecimal digits `0`-`F` encased in backtick (`) characters. If such an ID took the form `` `NeN` `` (where *N* represents a string of the decimal digits `0`-`9`, and `e` is a literal uppercase or lowercase “E” character). Removing the backticks when writing the identifier into the binary log left behind a substring which the slave MySQL server tried to interpret as a floating point number, rather than as an identifier. The resulting syntax error caused loss of replication. (Bug #55961)

References: See also Bug #55962.

- Row subqueries producing no rows were not handled as `UNKNOWN` values in row-comparison expressions. (Bug #54190)
- With an `UPDATE IGNORE` statement including a subquery that was evaluated using a temporary table, an error transferring the data from the temporary was ignored, causing an assertion to be raised. (Bug #54543)
- If a query specified a `DATE` or `DATETIME` value in a format different from `'YYYY-MM-DD HH:MM:SS'`, a greater-than-or-equal (`>=`) condition matched only greater-than values in an indexed `TIMESTAMP` column. (Bug #55779, Bug #50774, Bug #11758558)
- If there was an active `SELECT` statement, an error arising during trigger execution could cause a server crash. (Bug #55421)
- The `max_length` metadata value of `MEDIUMBLOB` types was reported as 1 byte greater than the correct value. (Bug #53296)
- Memory leaks detected by Valgrind were corrected. (Bug #56709)
- When `mysqld` was started as a service on Windows and `mysqld` was writing the error log to a file (for example, if it was started with the `--log-error` [431] option), the server reassigned the file descriptors of the `stdout` and `stderr` streams to the file descriptor of the log file. On Windows, if `stdout` or `stderr` is not associated with an output stream, the file descriptor returns a negative value. Previously, this caused the file descriptor reassignment to fail and the server to abort. To avoid this problem on Windows, the server now first assigns the `stdout` and `stderr` streams to the log file stream by opening this file. This causes the `stdout` and `stderr` file descriptors to be nonzero and the server can successfully reassign them to the file descriptor of the log file. (Bug #56821)

  References: This bug is a regression of Bug #29751.
- Using `REPAIR TABLE tbl_name USE_FRM` on a `MERGE` table caused the server to crash. (Bug #46339)
- In some cases, when the left part of a `NOT IN` subquery predicate was a row and contained `NULL` values, the query result was incorrect. (Bug #51070)
- `EXPLAIN` produced an incorrect `rows` value for queries evaluated using an index scan and that included `LIMIT`, `GROUP BY`, and `ORDER BY` on a computed column. (Bug #50394)
- For some queries, the optimizer produced incorrect results using the Index Merge access method with `InnoDB` tables. (Bug #50402)
- `mysql_store_result()` and `mysql_use_result()` are not for use with prepared statements and are not intended to be called following `mysql_stmt_execute()`, but failed to return an error when invoked that way. (Bug #47485)
- A malformed packet sent by the server when the query cache was in use resulted in lost-connection errors. (Bug #42503)
- `CREATE TABLE` failed if a column referred to in an index definition and foreign key definition had different lettercases in the two definitions. (Bug #39932)

Changes in MySQL 5.1.51 (2010-09-10)

InnoDB Plugin Notes

- `InnoDB Plugin` has been upgraded to version 1.0.12. This version is considered of General Availability (GA) quality.

  In this release, the `InnoDB Plugin` is included in source and binary distributions, except RHEL3, RHEL4, SuSE 9 (x86, x86_64, ia64), and generic Linux RPM packages. It also does not work for FreeBSD 6 and HP-UX or for Linux on generic ia64.

Functionality Added or Changed

- **Incompatible Change**: Previously, if you flushed the logs using `FLUSH LOGS` or `mysqladmin flush-logs` and `mysqld` was writing the error log to a file (for example, if it was started with the `--log-error` [431] option), it renamed the current log file with the suffix `-old`, then created a new empty log file. This had the problem that a second log-flushing operation thus caused the original error log file to be lost unless you saved it under a different name. For example, you could use the following commands to save the file:

  ```
  shell> mysqladmin flush-logs
  shell> mv host_name.err-old backup-directory
  ```

  To avoid the preceding file-loss problem, renaming no longer occurs. The server merely closes and reopens the log file. To rename the file, you can do so manually before flushing. Then flushing the logs reopens a new file with the original file name. For example, you can rename the file and create a new one using the following commands:

  ```
  shell> mv host_name.err host_name.err-old
  shell> mysqladmin flush-logs
  shell> mv host_name.err-old backup-directory
  ```

  (Bug #29751)

  References: See also Bug #56821.

Bugs Fixed

- **Security Fix**: Queries could cause a server crash if the `GREATEST()` [942] or `LEAST()` [943] function had a mixed list of numeric and `LONGBLOB` arguments, and the result of such a function was processed using an intermediate temporary table. (Bug #54461, CVE-2010-3838)

- **Security Fix**: During evaluation of arguments to extreme-value functions such as `LEAST()` [943] and `GREATEST()` [942], type errors did not propagate properly, causing the server to crash. (Bug #55826, CVE-2010-3833)

- **Security Fix**: The server could crash after materializing a derived table that required a temporary table for grouping. (Bug #55568, CVE-2010-3834)

- **Security Fix**: Queries with nested joins could cause an infinite loop in the server when used from stored procedures and prepared statements. (Bug #53544, CVE-2010-3839)

- **Security Fix**: `GROUP_CONCAT()` [1046] and `WITH ROLLUP` together could cause a server crash. (Bug #54476, CVE-2010-3837)

- **Security Fix**: Pre-evaluation of `LIKE` predicates during view preparation could cause a server crash. (Bug #54568, Bug #11762026, CVE-2010-3836)

- **Security Fix**: A user-variable assignment expression that is evaluated in a logical expression context can be precalculated in a temporary table for `GROUP BY`. However, when the expression value is used after creation of the temporary table, it was re-evaluated, not read from the table, and a server crash resulted. (Bug #55564, CVE-2010-3835)

- **Security Fix**: The `CONVERT_TZ()` [981] function crashed the server when the timezone argument was an empty `SET` column value. (Bug #55424)
- **Security Fix**: The `PolyFromWKB()` [1062] function could crash the server when improper WKB data was passed to the function. (Bug #51875, Bug #11759554, CVE-2010-3840)
- **Incompatible Change**: **Replication**: As of MySQL 5.5.6, handling of `CREATE TABLE IF NOT EXISTS ... SELECT` statements has been changed for the case that the destination table already exists:
  - Previously, for `CREATE TABLE IF NOT EXISTS ... SELECT`, MySQL produced a warning that the table exists, but inserted the rows and wrote the statement to the binary log anyway. By contrast, `CREATE TABLE ... SELECT` (without `IF NOT EXISTS`) failed with an error, but MySQL inserted no rows and did not write the statement to the binary log.
  - MySQL now handles both statements the same way when the destination table exists, in that neither statement inserts rows or is written to the binary log. The difference between them is that MySQL produces a warning when `IF NOT EXISTS` is present and an error when it is not.

  This change in handling of `IF NOT EXISTS` results in an incompatibility for statement-based replication from a MySQL 5.1 master with the original behavior and a MySQL 5.5 slave with the new behavior. Suppose that `CREATE TABLE IF NOT EXISTS ... SELECT` is executed on the master and the destination table exists. The result is that rows are inserted on the master but not on the slave. (Row-based replication does not have this problem.)

  To address this issue, statement-based binary logging for `CREATE TABLE IF NOT EXISTS ... SELECT` is changed in MySQL 5.1 as of 5.1.51:
  - If the destination table does not exist, there is no change: The statement is logged as is.
  - If the destination table does exist, the statement is logged as the equivalent pair of `CREATE TABLE IF NOT EXISTS` and `INSERT ... SELECT` statements. (If the `SELECT` in the original statement is preceded by `IGNORE` or `REPLACE`, the `INSERT` becomes `INSERT IGNORE` or `REPLACE`, respectively.)

  This change provides forward compatibility for statement-based replication from MySQL 5.1 to 5.5 because when the destination table exists, the rows will be inserted on both the master and slave. To take advantage of this compatibility measure, the 5.1 server must be at least 5.1.51 and the 5.5 server must be at least 5.5.6.

  To upgrade an existing 5.1-to-5.5 replication scenario, upgrade the master first to 5.1.51 or higher. Note that this differs from the usual replication upgrade advice of upgrading the slave first.

  A workaround for applications that wish to achieve the original effect (rows inserted regardless of whether the destination table exists) is to use `CREATE TABLE IF NOT EXISTS` and `INSERT ... SELECT` statements rather than `CREATE TABLE IF NOT EXISTS ... SELECT` statements.

  Along with the change just described, the following related change was made: Previously, if an existing view was named as the destination table for `CREATE TABLE IF NOT EXISTS ... SELECT`, rows were inserted into the underlying base table and the statement was written to the binary log. As of MySQL 5.1.51 and 5.5.6, nothing is inserted or logged. (Bug #47442, Bug #47132, Bug #48814, Bug #49494)
- **Important Change**: **InnoDB**: The server could crash with an assertion, possibly leading to data corruption, while updating the primary key of an `InnoDB` table containing `BLOB` or other columns requiring off-page storage. This fix applies to the `InnoDB` Plugin in MySQL 5.1, and to `InnoDB` 1.1 in MySQL 5.5. (Bug #55543)
- **InnoDB**: If the server crashed during a `RENAME TABLE` operation on an `InnoDB` table, subsequent crash recovery could fail. This problem could also affect an `ALTER TABLE` statement that caused a rename operation internally. (Bug #55027)

- **InnoDB**: A heavy workload with a large number of threads could cause a crash in the debug version of the server. (Bug #55699)
- **InnoDB**: When MySQL was restarted after a crash with the option `innodb_force_recovery=6`, certain queries against `InnoDB` tables could fail, depending on `WHERE` or `ORDER BY` clauses.

  Usually in such a disaster recovery situation, you dump the entire table using a query without these clauses. During advanced troubleshooting, you might use queries with these clauses to diagnose the position of the corrupted data, or to recover data following the corrupted part. (Bug #55832)
- **InnoDB**: The `CHECK TABLE` command could cause a time-consuming verification of the `InnoDB` adaptive hash index memory structure. Now this extra checking is only performed in binaries built for debugging. (Bug #55716)
- **InnoDB**: The server could crash when opening an `InnoDB` table linked through foreign keys to a long chain of child tables. (Bug #54582)
- **Partitioning**: When the storage engine used to create a partitioned table was disabled, attempting to drop the table caused the server to crash. (Bug #46086)
- `INFORMATION_SCHEMA.COLUMNS` reported incorrect precision for `BIGINT UNSIGNED` columns. (Bug #53814)
- `INSERT IGNORE INTO ... SELECT` statements could raise a debug assertion. (Bug #54106)
- The server was not checking for errors generated during the execution of `Item::val_xxx()` methods when copying data to a group, order, or distinct temp table's row. (Bug #55580)
- `ORDER BY` clauses that included user-variable expressions could raise a debug assertion. (Bug #55565)
- `MIN()` [1047] or `MAX()` [1046] with a subquery argument could raise a debug assertion for debug builds or return incorrect data for nondebug builds. (Bug #54465)
- `INFORMATION_SCHEMA` plugins with no `deinit()` method resulted in a memory leak. (Bug #54253)
- If a view was named as the destination table for `CREATE TABLE ... SELECT`, the server produced a warning whether or not `IF NOT EXISTS` was used. Now it produces a warning only when `IF NOT EXISTS` is used, and an error otherwise. (Bug #55777)
- Queries involving predicates of the form *`const`* `NOT BETWEEN` *`not_indexed_column`* `AND` *`indexed_column`* could return incorrect data due to incorrect handling by the range optimizer. (Bug #54802)
- After the fix for Bug #39653, the shortest available secondary index was used for full table scans. The primary clustered key was used only if no secondary index could be used. However, when the chosen secondary index includes all columns of the table being scanned, it is better to use the primary index because the amount of data to scan is the same but the primary index is clustered. This is now taken into account. (Bug #55656)
- After `ALTER TABLE` was used on a temporary transactional table locked by `LOCK TABLES`, any later attempts to execute `LOCK TABLES` or `UNLOCK TABLES` caused a server crash. (Bug #54117)
- Assignment of `InnoDB` scalar subquery results to a variable resulted in unexpected `S` locks in `READ COMMITTED` [1224] transaction isolation level. (Bug #55382)
- `XA START` had a race condition that could cause a server crash. (Bug #51855)
- The fix for Bug #30234 caused the server to reject the `DELETE` *`tbl_name`*`.* ...` Access compatibility syntax for multiple-table `DELETE` statements. (Bug #53034)
- Enumeration plugin variables were subject to a type-casting error, causing inconsistent results between different platforms. (Bug #42144)

- A PKG install on Solaris put some files in incorrect locations. (Bug #31058)
- Problems in the atomic operations implementation could lead to server crashes. (Bug #22320, Bug #52261)

Changes in MySQL 5.1.50 (2010-08-03)

icc Notes

- This is the final release of MySQL 5.1 for which Generic Linux MySQL binary packages built with the `icc` compiler on x86 and x86_64 will be offered. These were previously produced as an alternative to our main packages built using `gcc`, as they provided noticeable performance benefits. In recent times the performance differences have diminished and build and runtime problems have surfaced, thus it is no longer viable to continue producing them.

  We continue to use the `icc` compiler to produce our distribution-specific RPM packages on ia64.

InnoDB Plugin Notes

- `InnoDB Plugin` has been upgraded to version 1.0.11. This version is considered of General Availability (GA) quality.

  In this release, the `InnoDB Plugin` is included in source and binary distributions, except RHEL3, RHEL4, SuSE 9 (x86, x86_64, ia64), generic Linux RPM packages, and any builds produced with the `icc` compiler. It also does not work for FreeBSD 6 and HP-UX or for Linux on generic ia64.

Bugs Fixed

- **Security Fix**: Bug #49124 was fixed.
- **InnoDB**: The server could crash during the recovery phase of startup, if it previously crashed while inserting `BLOB` or other large columns that use off-page storage into an `InnoDB` table created with `ROW_FORMAT=REDUNDANT` or `ROW_FORMAT=COMPACT`. (Bug #54408)
- **InnoDB**: The server could crash on shutdown, if started with `--innodb-use-system-malloc=0`. (Bug #55581, Bug #11762927)
- **InnoDB**: For an `InnoDB` table created with `ROW_FORMAT=COMPRESSED` or `ROW_FORMAT=DYNAMIC`, a query using the `READ UNCOMMITTED` isolation level could cause the server to stop with an assertion error, if `BLOB` or other large columns that use off-page storage were being inserted at the same time. (Bug #54358)
- **InnoDB**: For debug builds, the database server could crash when renaming a table that had active transactions. (Bug #54453)
- **Partitioning**: `INSERT ON DUPLICATE KEY UPDATE` statements performed poorly on tables having many partitions. The handler function for reading a row from a specific index was not optimized in the partitioning handler. (Bug #52455)
- **Partitioning**: `UPDATE` and `INSERT` statements affecting partitioned tables performed poorly when using row-based replication. (Bug #52517)

  References: This bug is a regression of Bug #39084.
- **Replication**: When using the row-based logging format, a failed `CREATE TABLE ... SELECT` statement was written to the binary log, causing replication to break if the failed statement was later re-run on the master. In such cases, a `DROP TABLE ... IF EXIST` statement is now logged in the event that a `CREATE TABLE ... SELECT` fails. (Bug #55625)
- Building MySQL on Solaris 8 x86 failed when using Sun Studio due to `gcc` inline assembly code. (Bug #55061)

- Builds of MySQL generated a large number of warnings. (Bug #53445)
- A client could supply data in chunks to a prepared statement parameter other than of type `TEXT` or `BLOB` using the `mysql_stmt_send_long_data()` C API function (or `COM_STMT_SEND_LONG_DATA` command). This led to a crash because other data types are not valid for long data. (Bug #54041)
- `mysql_secure_installation` did not properly identify local accounts and could incorrectly remove nonlocal `root` accounts. (Bug #54004)
- In debug builds, an assertion could be raised when the server tried to send an OK packet to the client after having failed to detect errors during processing of the `WHERE` condition of an `UPDATE` statement. (Bug #54734)
- Portability problems in `SHOW STATUS` could lead to incorrect results on some platforms. (Bug #53493)
- `GROUP BY` operations used `max_sort_length` [498] inconsistently. (Bug #55188)
- A join with an aggregated function and impossible `WHERE` condition returned an extra row. (Bug #54416)
- On FreeBSD, memory mapping for `MERGE` tables could fail if underlying tables were empty. (Bug #47139)
- The ABI check for MySQL failed to compile with `gcc` 4.5. (Bug #52514)
- `mysql_secure_installation` sometimes failed to locate the `mysql` client. (Bug #52274)
- Reading a `ucs2` data file with `LOAD DATA INFILE` was subject to three problems. 1) Incorrect parsing of the file as `ucs2` data, resulting in incorrect length of the parsed string. This is fixed by truncating the invalid trailing bytes (incomplete multi-byte characters) when reading from the file. 2) Reads from a proper `ucs2` file did not recognize newline characters. This is fixed by first checking whether a byte is a newline (or any other special character) before reading it as a part of a multi-byte character. 3) When using user variables to hold column data, the character set of the user variable was set incorrectly to the database charset. This is fixed by setting it to the character set specified in the `LOAD DATA INFILE` statement, if any. (Bug #51876)
- With `lower_case_table_names` [492] set to a nonzero value, searches for table or database names in `INFORMATION_SCHEMA` tables could produce incorrect results. (Bug #53095)
- Searches in `INFORMATION_SCHEMA` tables for rows matching a nonexistent database produced an error instead of an empty query result. (Bug #49542)
- A debugging assertion could be raised after a write failure to a closed socket. (Bug #42496)
- The `my_like_range_xxx()` functions returned badly formed maximum strings for Asian character sets, which caused problems for storage engines. (Bug #45012)
- An assertion failure occurred within yaSSL for very long keys. (Bug #29784)

  References: See also Bug #53463.

Changes in MySQL Enterprise 5.1.49sp1 [QSP] (2010-09-28)

This is a *Service Pack* release of the MySQL Enterprise Server 5.1.

Bugs Fixed

- Building MySQL on Solaris 8 x86 failed when using Sun Studio due to `gcc` inline assembly code. (Bug #55061)

- A client could supply data in chunks to a prepared statement parameter other than of type `TEXT` or `BLOB` using the `mysql_stmt_send_long_data()` C API function (or `COM_STMT_SEND_LONG_DATA` command). This led to a crash because other data types are not valid for long data. (Bug #54041)

Changes in MySQL 5.1.49 (2010-07-09)

InnoDB Plugin Notes

- `InnoDB Plugin` has been upgraded to version 1.0.10. This version is considered of General Availability (GA) quality.

  In this release, the `InnoDB Plugin` is included in source and binary distributions, except RHEL3, RHEL4, SuSE 9 (x86, x86_64, ia64), generic Linux RPM packages, and any builds produced with the `icc` compiler. It also does not work for FreeBSD 6 and HP-UX or for Linux on generic ia64.

Functionality Added or Changed

- **InnoDB**: The mechanism that checks if there is enough space for redo logs was improved, reducing the chance of encountering this message: `ERROR: the age of the last checkpoint is x, which exceeds the log group capacity y`. (Bug #39168)

Bugs Fixed

- **InnoDB**: **Security Fix**: After changing the values of the `innodb_file_format` or `innodb_file_per_table` configuration parameters, DDL statements could cause a server crash. (Bug #55039, CVE-2010-3676)
- **Security Fix**: The server could crash if there were alternate reads from two indexes on a table using the `HANDLER` interface. (Bug #54007, CVE-2010-3681)
- **Security Fix**: Use of `TEMPORARY InnoDB` tables with nullable columns could cause a server crash. (Bug #54044, CVE-2010-3680)
- **Security Fix**: A malformed argument to the `BINLOG` statement could result in Valgrind warnings or a server crash. (Bug #54393, CVE-2010-3679)
- **Security Fix**: Incorrect handling of `NULL` arguments could lead to a crash for `IN()` [942] or `CASE` [946] operations when `NULL` arguments were either passed explicitly as arguments (for `IN()` [942]) or implicitly generated by the `WITH ROLLUP` modifier (for `IN()` [942] and `CASE` [946]). (Bug #54477, CVE-2010-3678)
- **Security Fix**: Joins involving a table with a unique `SET` column could cause a server crash. (Bug #54575, CVE-2010-3677)
- **Security Fix**: `LOAD DATA INFILE` did not check for SQL errors and sent an OK packet even when errors were already reported. Also, an assert related to client/server protocol checking in debug servers sometimes was raised when it should not have been. (Bug #52512, CVE-2010-3683)
- **Security Fix**: Using `EXPLAIN` with queries of the form `SELECT ... UNION ... ORDER BY (SELECT ... WHERE ...)` could cause a server crash. (Bug #52711, CVE-2010-3682)
- **Security Fix**: Bug #52315 was fixed.
- **Security Fix**: Bug #53933 was fixed.
- **InnoDB**: Fast index creation in the `InnoDB Plugin` could fail, leaving the new secondary index corrupted. (Bug #54330)
- **InnoDB**: `InnoDB` could issue an incorrect message on startup, if tables were created under the setting `innodb_file_per_table=ON`. The message was of the form `InnoDB: Warning: allocated tablespace n, old maximum was 0`. If you encounter this message after

upgrading, create an `InnoDB` table with `innodb_file_per_table = ON` and restart the server. The message should not be displayed any more. If you continue to encounter this message, or if you get it and haven't used a version without this fix, you might have corruption in your shared tablespace. If so, back up and reload your data. (Bug #54658)

- **InnoDB**: An `ALTER TABLE` statement could convert an `InnoDB` compressed table (with `row_format=compressed`) back to an uncompressed table (with `row_format=compact`). (Bug #54679)

- **InnoDB**: Some combinations of `SELECT` and `SELECT FOR UPDATE` statements could fail with errors about locks, or incorrectly release a row lock during a semi-consistent read operation. (Bug #53674)

- **InnoDB**: Performing large numbers of `RENAME TABLE` statements caused excessive memory use. (Bug #47991)

- **Replication**: Two related issues involving temporary tables and transactions were introduced by a fix made in MySQL 5.1.37:

  1. When a temporary table was created or dropped within a transaction, any failed statement that following the `CREATE TEMPORARY TABLE` or `DROP TEMPORARY TABLE` statement triggered a rollback, which caused the slave to diverge from the master.

  2. When a `CREATE TEMPORARY TABLE ... SELECT * FROM ...` statement was executed within a transaction in which only tables using transactional storage engines were used and the transaction was rolled back at the end, the changes—including the creation of the temporary table—were not written to the binary log.

  The current fix restores the correct behavior in both of these cases. (Bug #53560)

  References: This bug was introduced by Bug #43929.

- **Replication**: When using unique keys on `NULL` columns in row-based replication, the slave sometimes chose the wrong row when performing an update. This happened because a table having a unique key on such a column could have multiple rows containing `NULL` for the column used by the unique key, and the slave merely picked the first row containing `NULL` in that column. (Bug #53893)

- **Replication**: `FLUSH LOGS` could in some circumstances crash the server. This occurred because the I/O thread could concurrently access the relay log I/O cache while another thread was performing the `FLUSH LOGS`, which closes and reopens the relay log and, while doing so, initializes (or re-initializes) its I/O cache. This could cause problems if some other thread (in this case, the I/O thread) is accessing it at the same time.

  Now the thread performing the `FLUSH LOGS` takes a lock on the relay log before actually flushing it. (Bug #53657)

  References: See also Bug #50364.

- **Replication**: When `CURRENT_USER()` [1033] or `CURRENT_USER` [1033] was used to supply the name and host of the affected user or of the definer in any of the statements `DROP USER`, `RENAME USER`, `GRANT`, `REVOKE`, and `ALTER EVENT`, the reference to `CURRENT_USER()` [1033] or `CURRENT_USER` [1033] was not expanded when written to the binary log. This resulted in `CURRENT_USER()` [1033] or `CURRENT_USER` [1033] being expanded to the user and host of the slave SQL thread on the slave, thus breaking replication. Now `CURRENT_USER()` [1033] and `CURRENT_USER` [1033] are expanded prior to being written to the binary log in such cases, so that the correct user and host are referenced on both the master and the slave. (Bug #48321)

- The `make_binary_distribution` target to `make` could fail on some platforms because the lines generated were too long for the shell. (Bug #54590)

- Builds of the embedded `mysqld` failed due to a missing element of the `struct NET`. (Bug #53908, Bug #53912)

- The definition of the `MY_INIT` macro in `my_sys.h` included an extraneous semicolon, which could cause compilation failure. (Bug #53906)
- A client with automatic reconnection enabled saw the error message `Lost connection to MySQL server during query` if the connection was lost between the `mysql_stmt_prepare()` and `mysql_stmt_execute()` C API functions. However, `mysql_stmt_errno()` returned 0, not the corresponding error number 2013. (Bug #53899)
- The server failed to disregard sort order for some zero-length tuples, leading to an assertion failure. (Bug #54459)
- The default value of `myisam_max_extra_sort_file_size` could be higher than the maximum accepted value, leading to warnings upon the server start. (Bug #54457)
- If a session tried to drop a database containing a table opened with `HANDLER` in another session, any `DATABASE` statement (`CREATE`, `DROP`, `ALTER`) executed by that session produced a deadlock. (Bug #54360)
- Queries that used `MIN()` [1047] or `MAX()` [1046] on indexed columns could be optimized incorrectly. (Bug #53859)
- A signal-handler redefinition for `SIGUSR1` was removed. The redefinition could cause the server to encounter a kernel deadlock on Solaris when there are many active threads. Other POSIX platforms might also be affected. (Bug #54667)
- Inconsistent checking of the relationship between `SHOW` statements and `INFORMATION_SCHEMA` queries caused such queries to fail sometimes. (Bug #54422)
- The `Lock_time` value in the slow query log was negative for stored routines. (Bug #53191)
- The results of some `ORDER BY ... DESC` queries were sorted incorrectly. (Bug #51431)
- `Index Merge` between three indexes could return incorrect results. (Bug #50389)
- Valgrind warnings in the `InnoDB` `compare_record()` function were corrected. (Bug #38999)
- The server could crash with an out of memory error when trying to parse a query that was too long to fit in memory. Now the parser rejects such queries with an `ER_OUT_OF_RESOURCES` [3959] error. (Bug #42064)
- Sort-`index_merge` for join tables other than the first table used excessive memory. (Bug #41660)
- `mysqld` could fail during execution when using SSL. (Bug #34236)
- The behavior of the RPM upgrade installation has changed. During an upgrade installation using the RPM packages, if the MySQL server is running when the upgrade occurs, the server is stopped, the upgrade occurs, and server is restarted. If the server is not already running when the RPM upgrade occurs, the server is not started at the end of the upgrade. The boot scripts for MySQL are installed in the appropriate directories in `/etc`, so the MySQL server will be restarted automatically at the next machine reboot. (Bug #27072)

Changes in MySQL 5.1.48 (2010-06-02)

InnoDB Plugin Notes

- `InnoDB Plugin` has been upgraded to version 1.0.9. This version is considered of General Availability (GA) quality.

  In this release, the `InnoDB Plugin` is included in source and binary distributions, except RHEL3, RHEL4, SuSE 9 (x86, x86_64, ia64), generic Linux RPM packages, and any builds produced with the `icc` compiler. It also does not work for FreeBSD 6 and HP-UX or for Linux on generic ia64.

Functionality Added or Changed

- The `Rows_examined` value in slow query log rows now is nonzero for `UPDATE` and `DELETE` statements that modify rows. (Bug #49756)

Bugs Fixed

- **Security Fix**: Bug #53907 was fixed.
- **Security Fix**: Bug #48157 was fixed.
- **Security Fix**: Bug #52357 was fixed.
- **Important Change**: **Replication**: `MyISAM` transactions replicated to a transactional slave left the slave in an unstable condition. This was due to the fact that, when replicating from a nontransactional storage engine to a transactional engine with `autocommit` [461] disabled, no `BEGIN` and `COMMIT` statements were written to the binary log; thus, on the slave, a never-ending transaction was started.

  The fix for this issue includes enforcing `autocommit` [461] mode on the slave by replicating all `autocommit=1` statements from the master. (Bug #29288)
- **InnoDB**: **Replication**: Reading from a table that used a self-logging storage engine and updating a table that used a transactional engine (such as `InnoDB`) generated changes that were written to the binary log using statement format which could make slaves diverge. However, when using mixed logging format, such changes should be written to the binary log using row format. (This issue did not occur when reading from tables using a self-logging engine and updating `MyISAM` tables, as this was already handled by checking for combinations of nontransactional and transactional engines.) Now such statements are classified as unsafe, and in mixed mode, cause a switch to row-based logging. (Bug #49019)
- **InnoDB**: The server could crash with a message `InnoDB: Assertion failure in thread` *nnnn*, typically during shutdown on a Windows system. (Bug #53947)
- **InnoDB**: Adding a unique key on multiple columns, where one of the columns is `NULL`, could mistakenly report duplicate key errors. (Bug #53290)
- **InnoDB**: Multi-statement execution could fail with an error about foreign key constraints. This problem could affect calls to `mysql_query()` and `mysql_real_query()`, and `CALL` statements that invoke stored procedures. (Bug #48024)
- **InnoDB**: Fixed a checksum error reported for compressed tables when the `--innodb_checksums` option is enabled. Although the message stated that the table was corrupted, the table is actually fine. (Bug #53248)
- **InnoDB**: Corrected the handling of the setting `innodb_change_buffering=default`. (The appropriate default value is different between MySQL 5.1 and 5.5.) (Bug #53165)
- **InnoDB**: If a crash occurs while creating an index using the InnoDB “Fast Index Creation” mechanism, the partially created index is dropped during the crash recovery processing when the database is restarted.
- **Partitioning**: When attempting to perform DDL on a partitioned table and the table's `.par` file could not be found, the server returned the inaccurate error message `Out of memory; restart server and try again (needed 2 bytes)`. Now in such cases, the server returns the error `Failed to initialize partitions from .par file`. (Bug #49161)
- **Partitioning**: `ALTER TABLE` statements that cause table partitions to be renamed or dropped (such as `ALTER TABLE ... ADD PARTITION`, `ALTER TABLE ... DROP PARTITION`, and `ALTER TABLE ... REORGANIZE PARTITION`) — when run concurrently with queries against the `INFORMATION_SCHEMA.PARTITIONS` table — could fail, cause the affected partitioned tables to become unusable, or both. This was due to the fact that the `INFORMATION_SCHEMA` database

ignored the name lock imposed by the `ALTER TABLE` statement on the partitions affected. In particular, this led to problems with `InnoDB` tables, because `InnoDB` would accept the rename operation, but put it in a background queue, so that subsequent rename operations failed when `InnoDB` was unable to find the correct partition. Now, `INFORMATION_SCHEMA` honors name locks imposed by ongoing `ALTER TABLE` statements that cause partitions to be renamed or dropped. (Bug #50561)

References: See also Bug #47343, Bug #45808.

- **Partitioning**: It was possible to execute a `CREATE TEMPORARY TABLE tmp LIKE pt` statement, where `pt` is a partitioned table, even though partitioned temporary tables are not permitted. This caused the server to crash. Now a check is performed to prevent such statements from being executed. (Bug #49477)

- **Replication**: In some cases, attempting to update a column with a value of an incompatible type resulted in a mismatch between master and slave because the column value was set to its implicit default value on the master (as expected), but the same column on the slave was set to `NULL`. (Bug #52868)

- **Replication**: When using a nontransactional table on the master with autocommit disabled, no `COMMIT` was recorded in the binary log following a statement affecting this table. If the slave's copy of the table used a transactional storage engine, the result on the slave was as though a transaction had been started, but never completed. (Bug #49522)

  References: See also Bug #29288.

- `UPDATE` on an `InnoDB` table modifying the same index that was used to satisfy the `WHERE` condition could trigger a debug assertion under some circumstances. (Bug #53830)

- Valgrind warnings resulting from passing incomplete `DATETIME` values to the `TIMESTAMP()` [993] function were corrected. (Bug #53942)

- Incorrect results could be returned for `LEFT JOIN` of `InnoDB` tables with an impossible `WHERE` condition. (Bug #53334)

- For single-table `DELETE` statements that used quick select and index scan simultaneously caused a server crash or assertion failure. (Bug #53450)

- MySQL incorrectly processed `ALTER DATABASE` `` `#mysql50#special` `` `UPGRADE DATA DIRECTORY NAME` where *`special`* was `.`, `..`, or a sequence starting with `./` or `../`. It used the server data directory (which contains other regular databases) as the database directory. (Bug #53804, CVE-2010-2008)

- `InnoDB` crashed when replacing duplicates in a table after a fast `ALTER TABLE` added a unique index. (Bug #53592)

- For `InnoDB` tables, the error handler for a fast `CREATE INDEX` did not reset the error state of the transaction before attempting to undo a failed operation, resulting in a crash. (Bug #53591)

- `mysqldump` and `SELECT ... INTO OUTFILE` truncated long `BLOB` and `TEXT` values to 766 bytes. (Bug #53088)

- In the debug version of the server, the `FreeState()` function could in some circumstances be called twice, leading to an assertion failure. (Bug #52884)

- Calculation of intervals for Event Scheduler events was not portable. (Bug #50087)

- Selecting from `INFORMATION_SCHEMA.ROUTINES` or `INFORMATION_SCHEMA.PARAMETERS` resulted in a memory leak. (Bug #48729)

- Aggregate functions could incorrectly return `NULL` in outer join queries. (Bug #52051)

- The Loose Index Scan optimization method assumed that it could depend on the partitioning engine to maintain interval endpoint information, as if it were a storage engine. (Bug #50939)
- When the transaction isolation level was `REPEATABLE READ` [1224] and binary logging used statement or mixed format, `SELECT` statements with subqueries referencing `InnoDB` tables unnecessarily acquired shared locks on rows in these tables. (Bug #46947)
- On Intel x86 machines, the optimizer could choose different execution plans for a query depending on the compiler version and optimization flags used to build the server binary. (Bug #48537)
- For outer joins, the optimizer could fail to properly calculate table dependencies. (Bug #52005)
- Setting the `innodb_change_buffering` [1363] system variable to `DEFAULT` produced an incorrect result. (Bug #53165)
- Using an initial command with `mysql_options(..., MYSQL_INIT_COMMAND, ...)` that generated multiple result sets (such as a stored procedure or a multi-statement command) left the connection unusable. (Bug #42373)

Changes in MySQL 5.1.47 (2010-05-06)

InnoDB Plugin Notes

- `InnoDB Plugin` has been upgraded to version 1.0.8. This version is considered of General Availability (GA) quality.

  In this release, the `InnoDB Plugin` is included in source and binary distributions, except RHEL3, RHEL4, SuSE 9 (x86, x86_64, ia64), and generic Linux RPM packages. It also does not work for FreeBSD 6 and HP-UX or for Linux on generic ia64.

Functionality Added or Changed

- **InnoDB**: `InnoDB` stores redo log records in a hash table during recovery. On 64-bit systems, this hash table was 1/8 of the buffer pool size. To reduce memory usage, the dimension of the hash table was reduced to 1/64 of the buffer pool size (or 1/128 on 32-bit systems). (Bug #53122)

Bugs Fixed

- **Security Fix**: The server failed to check the table name argument of a `COM_FIELD_LIST` command packet for validity and compliance to acceptable table name standards. This could be exploited to bypass almost all forms of checks for privileges and table-level grants by providing a specially crafted table name argument to `COM_FIELD_LIST`.

  In MySQL 5.0 and above, this permitted an authenticated user with `SELECT` [627] privileges on one table to obtain the field definitions of any table in all other databases and potentially of other MySQL instances accessible from the server's file system.

  Additionally, for MySQL version 5.1 and above, an authenticated user with `DELETE` [626] or `SELECT` [627] privileges on one table could delete or read content from any other table in all databases on this server, and potentially of other MySQL instances accessible from the server's file system. (Bug #53371, CVE-2010-1848)
- **Security Fix**: The server could be tricked into reading packets indefinitely if it received a packet larger than the maximum size of one packet. (Bug #50974, CVE-2010-1849)
- **Security Fix**: The server was susceptible to a buffer-overflow attack due to a failure to perform bounds checking on the table name argument of a `COM_FIELD_LIST` command packet. By sending long data for the table name, a buffer is overflown, which could be exploited by an authenticated user to inject malicious code. (Bug #53237, CVE-2010-1850)
- **Performance**: **InnoDB**: Deadlock detection could be a bottleneck in `InnoDB` processing, if many transactions attempted to update the same row simultaneously. The algorithm has been improved

to enhance performance and scalability, in the InnoDB Plugin for MySQL 5.1, and in InnoDB 1.1 for MySQL 5.5. (Bug #49047)

- **Important Change**: **Replication**: When invoked, `CHANGE MASTER TO` and `SET GLOBAL sql_slave_skip_counter` now cause information to be written to the error log about the slave's state prior to execution of the statement. For `CHANGE MASTER TO`, this information includes the previous values of `MASTER_HOST`, `MASTER_PORT`, `MASTER_LOG_FILE`, and `MASTER_LOG_POS`. For `SET GLOBAL sql_slave_skip_counter`, this information includes the previous values of `RELAY_LOG_FILE`, `RELAY_LOG_POS`, and `sql_slave_skip_counter` [1647]. (Bug #43406, Bug #43407)

- **InnoDB**: The values of `innodb_buffer_pool_pages_total` and `innodb_buffer_pool_pages_misc` in the `information_schema.global_status` table could be computed incorrectly. (Bug #52983)

- **InnoDB**: `InnoDB Plugin` checks to see whether a row could possibly exceed the maximum size if all columns are fully used. This produced `Row size too large` errors for some tables that could be created with the built-in `InnoDB`. Now the check is only done when `innodb_strict_mode` [1382] is enabled or if the table is dynamic or compressed. (Bug #50495)

- **InnoDB**: Connections waiting for an `InnoDB` row lock ignored `KILL` until the row lock wait ended. Now, `KILL` during lock wait results in “query interrupted” instead of “lock wait timeout exceeded”. The corresponding transaction is rolled back. (Bug #51920)

- **InnoDB**: An overly strict assertion could fail during the purge of delete-marked records in `DYNAMIC` or `COMPRESSED InnoDB` tables that contain column prefix indexes. (Bug #52746)

- **InnoDB**: `InnoDB` attempted to choose off-page storage without ensuring that there was an “off-page storage” flag in the record header. To correct this, in `DYNAMIC` and `COMPRESSED` formats, `InnoDB` stores locally any non-`BLOB` columns having a maximum length not exceeding 256 bytes. This is because there is no room for the “external storage” flag when the maximum length is 255 bytes or less. This restriction trivially holds in `REDUNDANT` and `COMPACT` formats, because there `InnoDB` always stores locally columns having a length up to `local_len` = 788 bytes. (Bug #52745)

- **InnoDB**: `InnoDB` page splitting could enter an infinite loop for compressed tables. (Bug #52964)

- **InnoDB**: When reporting a foreign key constraint violation during `INSERT`, `InnoDB` could display uninitialized data for the `DB_TRX_ID` and `DB_ROLL_PTR` system columns. (Bug #53202)

- **InnoDB**: A mismatch between index information maintained within the `.frm` files and the corresponding information in the InnoDB system tablespace could produce this error: `[ERROR] Index index of table has n columns unique inside InnoDB, but MySQL is asking statistics for m columns. Have you mixed up .frm files from different installations?` (Bug #44571)

- **Replication**: The failure of a `REVOKE` statement was logged with the wrong error code, causing replication slaves to stop even when the failure was expected on the master. (Bug #51987)

- Certain path names passed to `LOAD_FILE()` [953] could cause a server crash. (Bug #53417)

- For updates to `InnoDB` tables, `TIMESTAMP` columns could be updated even when no values actually changed. (Bug #47453)

- Setting `@@GLOBAL.debug` [469] to an empty string failed to clear the current debug settings. (Bug #52629)

- For debug builds, creating a view containing a subquery that might require collation adjustment caused an assertion to be raised. For example, this could occur if some items had different collations but the result collation could be adjusted to the one of them. (Bug #52120)

- Locking involving the `LOCK_plugin`, `LOCK_global_system_variables`, and `LOCK_status` mutexes could deadlock. (Bug #51591)

- `InnoDB` fast index creation could incorrectly use a table copy in some cases. (Bug #50946)
- If the server is started with `--skip-grant-tables` [443], plugin loading and unloading should be prohibited, but the server failed to reject `INSTALL PLUGIN` and `UNINSTALL PLUGIN` statements. (Bug #46261)
- On Windows, the server failed to find a description for Event ID 100. (Bug #48042)
- A syntactically invalid trigger could cause the server to crash when trying to list triggers. (Bug #50755)
- A memory leak occurred due to missing deallocation of the `comparators` array (a member of the `Arg_comparator` class). (Bug #52124)
- `EXPLAIN` could cause a server crash for some queries with subqueries. (Bug #48419)
- In MySQL 5.1, `READ COMMITTED` [1224] was changed to use less locking due to the availability of row-based binary logging (see the Note under `READ COMMITTED` [1224] at `SET TRANSACTION` Syntax). However, `READ UNCOMMITTED` [1225] did not have the same change, so it was using more locks than the higher isolation level, which is unexpected. This was changed so that `READ UNCOMMITTED` [1225] now also uses the lesser amount of locking and has the same restrictions for binary logging. (Bug #48607)
- Semi-consistent read was implemented for `InnoDB` to address Bug #3300. Semi-consistent reads do not block when a nonmatching record is already locked by some other transaction. If the record is not locked, a lock is acquired, but is released if the record does not match the `WHERE` condition. However, semi-consistent read was attempted even for `UPDATE` statements having a `WHERE` condition of the form `pk_col1=constant1, ..., pk_colN=constantN`. Some code failed that was designed with the assumption that semi-consistent read would be only attempted on table scans. (Bug #52663)
- `mysqld_safe` did not always pass `--open-files-limit` [242] through to `mysqld`. `mysqld_safe` did not treat dashes and underscores as equivalent in option names. (Bug #47095)
- Setting `--secure-file-priv` [442] to the empty string left the value unaffected. (Bug #50373)
- Storage engine plugins on Windows could've been built with a definition of `time_t` which was different from the server expectations. The difference could cause affected plugins to crash. In addition, the use of the `time_t` type in the storage engine API layer has been enforced. (Bug #39802, Bug #40092)
- When using `UNINSTALL PLUGIN` to remove a loaded plugin, open tables and connections caused `mysqld` to hang until the open connections had been closed. (Bug #39053)
- `InnoDB` could fail to create a unique index on `NULL` columns. (Bug #41904)
- 1) In rare cases, if a thread was interrupted during a `FLUSH PRIVILEGES` operation, a debug assertion occurred later due to improper diagnostics area setup. 2) A `KILL` operation could cause a console error message referring to a diagnostic area state without first ensuring that the state existed. (Bug #33982)

Changes in MySQL Enterprise 5.1.46sp1 [QSP] (2010-06-23)

This is a *Service Pack* release of the MySQL Enterprise Server 5.1.

Important

If you intend to use the plugin version of `InnoDB`, we recommend that you use MySQL 5.1.48 or later instead of 5.1.46sp1. This is because 5.1.46sp1 contains the first production-ready version and the later version has fixes for some of the bugs found during more widespread production use.

Bugs Fixed

- **Security Fix**: The server failed to check the table name argument of a `COM_FIELD_LIST` command packet for validity and compliance to acceptable table name standards. This could be exploited to bypass almost all forms of checks for privileges and table-level grants by providing a specially crafted table name argument to `COM_FIELD_LIST`.

  In MySQL 5.0 and above, this permitted an authenticated user with `SELECT` [627] privileges on one table to obtain the field definitions of any table in all other databases and potentially of other MySQL instances accessible from the server's file system.

  Additionally, for MySQL version 5.1 and above, an authenticated user with `DELETE` [626] or `SELECT` [627] privileges on one table could delete or read content from any other table in all databases on this server, and potentially of other MySQL instances accessible from the server's file system. (Bug #53371, CVE-2010-1848)

- **Security Fix**: The server could be tricked into reading packets indefinitely if it received a packet larger than the maximum size of one packet. (Bug #50974, CVE-2010-1849)

- **Security Fix**: The server was susceptible to a buffer-overflow attack due to a failure to perform bounds checking on the table name argument of a `COM_FIELD_LIST` command packet. By sending long data for the table name, a buffer is overflown, which could be exploited by an authenticated user to inject malicious code. (Bug #53237, CVE-2010-1850)

- **InnoDB**: `InnoDB` attempted to choose off-page storage without ensuring that there was an “off-page storage” flag in the record header. To correct this, in `DYNAMIC` and `COMPRESSED` formats, `InnoDB` stores locally any non-`BLOB` columns having a maximum length not exceeding 256 bytes. This is because there is no room for the “external storage” flag when the maximum length is 255 bytes or less. This restriction trivially holds in `REDUNDANT` and `COMPACT` formats, because there `InnoDB` always stores locally columns having a length up to `local_len` = 788 bytes. (Bug #52745)

- **InnoDB**: `InnoDB` page splitting could enter an infinite loop for compressed tables. (Bug #52964)

- MySQL incorrectly processed `ALTER DATABASE` `` `#mysql50#special` `` `UPGRADE DATA DIRECTORY NAME` where *`special`* was `.`, `..`, or a sequence starting with `./` or `../`. It used the server data directory (which contains other regular databases) as the database directory. (Bug #53804, CVE-2010-2008)

- A syntactically invalid trigger could cause the server to crash when trying to list triggers. (Bug #50755)

- `EXPLAIN` could cause a server crash for some queries with subqueries. (Bug #48419)

- Selecting from `INFORMATION_SCHEMA.ROUTINES` or `INFORMATION_SCHEMA.PARAMETERS` resulted in a memory leak. (Bug #48729)

Changes in MySQL 5.1.46 (2010-04-06)

Important

If you intend to use the plugin version of `InnoDB`, we recommend that you use MySQL 5.1.48 or later instead of 5.1.46sp1. This is because 5.1.46 contains the first production-ready version and the later version has fixes for some of the bugs found during more widespread production use.

InnoDB Plugin Notes

- `InnoDB Plugin` has been upgraded to version 1.0.7. This version is considered of General Availability (GA) quality. InnoDB Storage Engine Change History, may contain information in addition to those changes reported here.

In this release, the `InnoDB Plugin` is included in source and binary distributions, except RHEL3, RHEL4, SuSE 9 (x86, x86_64, ia64), and generic Linux RPM packages. It also does not work for FreeBSD 6 and HP-UX or for Linux on generic ia64.

Functionality Added or Changed

- A new system variable, `skip_name_resolve` [522], is set from the value of the `--skip-name-resolve` [443] server option. This provides a way to determine at runtime whether the server uses name resolution for client connections. (Bug #37168)

Bugs Fixed

- **Security Fix**: Privilege checking for `UNINSTALL PLUGIN` was incorrect. (Bug #51770, CVE-2010-1621)
- **Performance**: **InnoDB**: The redo scan during `InnoDB` recovery used excessive CPU. The efficiency of this scan was improved for `InnoDB Plugin`, significantly speeding up crash recovery. (Bug #49535, Bug #29847)
- **Performance**: **InnoDB**: `InnoDB Plugin` page-freeing operations were made faster for compressed blocks, speeding up `ALTER TABLE`, `DROP TABLE`, and other operations on compressed tables that free compressed blocks. One symptom of the older behavior could be 100% CPU use during these operations. (Bug #35077)
- **Performance**: While looking for the shortest index for a covering index scan, the optimizer did not consider the full row length for a clustered primary key, as in `InnoDB`. Secondary covering indexes are now preferred, making full table scans less likely. (Bug #39653)

  References: See also Bug #55656.
- **Important Change**: When using fast `ALTER TABLE`, different internal ordering of indexes in the MySQL optimizer and the `InnoDB` storage engine could cause error messages about possibly mixed up `.frm` files and incorrect index use. (Bug #47622)
- **InnoDB**: **Replication**: `TRUNCATE TABLE` performed on a temporary table using the `InnoDB` storage engine was logged even when using row-based mode. (Bug #51251)
- **InnoDB**: **Replication**: Column length information generated by `InnoDB` did not match that generated by `MyISAM`, which caused invalid metadata to be written to the binary log when trying to replicate `BIT` columns. (Bug #49618)
- **InnoDB**: Fixed a performance issue on Windows systems that affected the InnoDB Plugin, by turning off atomic instructions. (Bug #52102)
- **InnoDB**: For `InnoDB Plugin`, bit fields were causing problems with concurrency on SMP systems because of word-packing issues. (Bug #52360)
- **InnoDB**: The AIX implementation of `readdir_r()` caused `InnoDB` errors. (Bug #50691)
- **Partitioning**: Partition pruning on `RANGE` partitioned tables did not always work correctly; the last partition was not excluded if the range was beyond it (when not using `MAXVALUE`). Now the last partition is not included if the partitioning function value is not within the range. (Bug #51830)
- **Partitioning**: The `insert_id` [482] server system variable was not reset following an insert that failed on a partitioned `MyISAM` table having an `AUTO_INCREMENT` column. (Bug #50392)
- **Partitioning**: Foreign keys are not supported on partitioned tables. However, it was possible using an `ALTER TABLE` statement to set a foreign key on a partitioned table; it was also possible to partition a table with a single foreign key. (Bug #50104)
- **Partitioning**: `GROUP BY` queries performed poorly for some partitioned tables. This was due to the block size not being set for partitioned tables, thus the keys per block was not correct, which could cause such queries to be optimized incorrectly. (Bug #48229)

References: See also Bug #37252.

- **Partitioning**: `REPAIR TABLE` failed for partitioned `ARCHIVE` tables. (Bug #46565)
- **Replication**: When run with the `--database` [350] option, `mysqlbinlog` printed `ROLLBACK` statements but did not print any corresponding `SAVEPOINT` statements. (Bug #50407)
- **Replication**: When a `CREATE EVENT` statement was followed by an additional statement and the statements were executed together as a single statement, the `CREATE EVENT` statement was padded with “garbage” characters when written to the binary log. This led to a syntax error when the event was read from the log. (Bug #50095)
- **Replication**: When using temporary tables, the binary log needs to insert a pseudo-thread ID for threads that are using temporary tables, each time a switch happens between two threads, both of which are using temporary tables. However, if a thread issued a failing statement before exit, its ID was not recorded in the binary log, and this in turn caused the ID for the next thread that tried to do something with a temporary table not to be logged as well. Subsequent replays of the binary log failed with the error `Table ... doesn't exist`. (Bug #51226)

  References: This bug is a regression of Bug #35583.
- **Replication**: If the master was using `sql_mode='TRADITIONAL'` [526], duplicate key errors were not sent to the slave, which received `0` rather than the expected error code. This caused replication to fail even when such an error was expected. (Bug #51055)
- **Replication**: The value of `Slave_IO_running` in the output of `SHOW SLAVE STATUS` did not distinguish between all 3 possible states of the slave I/O thread (not running; running but not connected; connected). Now the value `Connecting` (rather than `No`) is shown when the slave I/O thread is running but the slave is not connected to a replication master.

  The server system variable `Slave_running` also reflects this change, and is now consistent with what is shown for `Slave_IO_running`. (Bug #30703, Bug #41613, Bug #51089)
- A problem with equality propagation optimization for prepared statements and stored procedures caused a server crash upon re-execution of the prepared statement or stored procedure. (Bug #51650)

  References: See also Bug #8115, Bug #8849.
- `InnoDB` did not reset table `AUTO_INCREMENT` values to the last used values after a server restart. (Bug #49032)
- A query that read from a derived table (of the form `SELECT ... FROM (SELECT ...)`) produced incorrect results when the following conditions were present:
  - The table subquery contained a derived query (`(SELECT ...) AS column`).
  - The derived query could potentially produce zero rows or a single `NULL` (that is, no rows matched, or the query used an aggregate function such as `SUM()` [1047] running over zero rows).
  - The table subquery joined at least two tables.
  - The join condition involved an index.

  (Bug #47904)
- A `HAVING` clause on a joined table in some cases failed to eliminate rows which should have been excluded from the result set. (Bug #51242)
- Performing a single in-place `ALTER TABLE` containing `ADD INDEX` and `DROP INDEX` options that used the same index name could result in a corrupt table definition file. Now such `ALTER TABLE` statements are no longer performed in place. (Bug #49838)

- The type inference used for view columns caused some columns in views to be handled as the wrong type, as compared to the same columns in base tables. `DATE` columns in base tables were treated as `TIME` columns in views, and base table `TIME` columns as view `DATETIME` columns. (Bug #50918)

- The `MERGE` engine failed to open a child table from a different database if the child table or database name contained characters that were subject to table name to file name encoding.

  Further, the `MERGE` engine did not properly open a child table from the same database if the child table name contained characters such as `'/'`, or `'#'`. (Bug #48265)

- If a stored function contained a `RETURN` statement with an `ENUM` value in the `ucs2` character set, `SHOW CREATE FUNCTION` and `SELECT DTD_IDENTIFIER FROM INFORMATION_SCHEMA.ROUTINES` returned incorrect values. (Bug #48766)

- `CHECKSUM TABLE` could compute the checksum for `BIT` columns incorrectly. (Bug #51304)

- `mysql_upgrade` did not detect when `CSV` log tables incorrectly contained columns that could be `NULL`. Now these columns are altered to be `NOT NULL`. (Bug #49823)

- The query shown by `EXPLAIN EXTENDED` plus `SHOW WARNINGS` could produce results different from the original query. (Bug #47669)

- For LDML-defined collations, some data structures were not initialized properly to enable `UPPER()` [959] and `LOWER()` [954] to work correctly. (Bug #51976)

- Invalid memory reads occurred for `HANDLER ... READ NEXT` after a failed `HANDLER ... READ FIRST`. (Bug #51877)

- The `YEAR` values `2000` and `0000` could be treated as equal. (Bug #49910)

- The optimizer performed an incorrect join type when `COALESCE()` [941] appeared within an `IN()` [942] operation. (Bug #51598)

- Following a bulk insert into a `MyISAM` table, if `MyISAM` failed to build indexes using repair by sort, data file corruption could occur. (Bug #51307)

- With an XA transaction active, `SET autocommit = 1` could cause side effects such as memory corruption or a server crash. (Bug #51342)

- The optimization to read `MIN()` [1047] or `MAX()` [1046] values from an index did not properly handle comparisons with `NULL` values. This could produce incorrect results for `MIN()` [1047] or `MAX()` [1046]when the `WHERE` clause tested a `NOT NULL` column for `NULL`. (Bug #47762)

- Killing a query during the optimization phase of a subquery could cause a server crash. (Bug #47761)

- Renaming a column of an `InnoDB` table caused the server to go out of sync with the `InnoDB` data dictionary. To avoid this issue, renaming a column uses the older technique of copying all the table data rather than updating the table in-place. (Bug #47621)

- Setting `myisam_repair_threads` [502] larger than 1 could result in the cardinality for all indexes of a `MyISAM` table being set to 1 after parallel index repair. (Bug #47444)

- In `LOAD DATA INFILE`, using a `SET` clause to set a column equal to itself caused a server crash. (Bug #51850)

- Use of `HANDLER` statements with tables that had spatial indexes caused a server crash. (Bug #51357)

- The server crashed when it could not determine the best execution plan for queries involving outer joins with nondeterministic `ON` clauses such as the ones containing the `RAND()` [975] function, a user-defined function, or a `NOT DETERMINISTIC` stored function. (Bug #48483)

- On Windows, `LOAD_FILE()` [953] could cause a crash for some pathnames. (Bug #51893)
- If `myisam_sort_buffer_size` [503] was set to a small value, table repair for `MyISAM` tables with `FULLTEXT` indexes could crash the server. (Bug #51866)
- `EXPLAIN EXTENDED` crashed trying to resolve references to freed temporary table columns for `GROUP_CONCAT()` [1046] `ORDER BY` arguments. (Bug #52397)
- In debug builds, if the listed columns in the view definition of the table used in an `INSERT ... SELECT` statement mismatched, an assertion was raised in the query cache invalidation code following the failing statement. (Bug #46615)
- The optimizer could attempt to evaluate the `WHERE` clause before any rows had been read, resulting in a server crash. (Bug #52177)
- `MyISAM` could write uninitialized data to new index pages. Now zeros are written to unused bytes in the pages. (Bug #47598)
- The server crashed when the optimizer attempted to determine constant tables but a table storage engine did not support exact record count. (Bug #51494)
- The server could crash populating the `INFORMATION_SCHEMA.PROCESSLIST` table due to lack of mutex protection. (Bug #51377)
- After `TRUNCATE TABLE` of a `MyISAM` table, subsequent queries could crash the server if `myisam_use_mmap` [504] was enabled. (Bug #51868)
- A trigger could change the behavior of assigning `NULL` to a `NOT NULL` column. (Bug #48525)
- A unique index on a column prefix could not be upgraded to a primary index even if there was no primary index already defined. (Bug #51378)
- `InnoDB` returned an error when inserting a negative value into an auto-increment column. (Bug #49497)
- `mysqlbinlog` option-processing code had a memory leak. (Bug #38468)
- `SHOW CREATE VIEW` returned invalid SQL if the definition contained a `SELECT 'string'` statement where the *`string`* was longer than the maximum length of a column name, due to the fact that this text was also used as an alias (in the `AS` clause).

  Because not all names retrieved from arbitrary `SELECT` statements can be used as view column names due to length and format restrictions, the server now checks the conformity of automatically generated column names and rewrites according to a predefined format any names that are not acceptable as view column names before storing the final view definition on disk.

  In such cases, the name is now rewritten as `Name_exp_`*`pos`*, where *`pos`* is the position of the column. To avoid this conversion scheme, define explicit, valid names for view columns using the *`column_list`* clause of the `CREATE VIEW` statement.

  As part of this fix, aliases are now generated only for top-level statements. (Bug #40277)
- `mysql_upgrade` did not create temporary files properly. (Bug #41057)
- It was possible for `DROP TABLE` of one `MyISAM` table to remove the data and index files of a different `MyISAM` table. (Bug #40980)
- If the arguments to a `CONCAT()` [951] call included a local routine variable, selecting the return value into a user variable could produce an incorrect result. (Bug #40625)
- For a query that selected from a view and used an alias for the view, the metadata used the alias name rather than the view name in the `MYSQL_FIELD.table` member. (Bug #41788)

- A query on a `FEDERATED` table in which the data was ordered by a `TEXT` column returned incorrect results. For example, a query such as the following produced incorrect results if column `column1` was a `TEXT` column:

  ```
  SELECT * FROM table1 ORDER BY column1;
  ```

  (Bug #32426)

- The test for `readline` during configuration failed when trying to build MySQL in a directory other than the source tree root. (Bug #35250)

Changes in MySQL 5.1.45 (2010-03-01)

InnoDB Plugin Notes

- This release includes `InnoDB Plugin` 1.0.6. This version is considered of Release Candidate (RC) quality.

  In this release, the `InnoDB Plugin` is included in source and binary distributions, except RHEL3, RHEL4, SuSE 9 (x86, x86_64, ia64), and generic Linux RPM packages. It also does not work for FreeBSD 6 and HP-UX or for Linux on generic ia64.

Functionality Added or Changed

- `mysqltest` has a new `--max-connections` option to set a higher number of maximum permitted server connections than the default 128. This option can also be passed using `mysql-test-run.pl`. (Bug #51135)

- `mysql-test-run.pl` has a new `--portbase` option and a corresponding `MTR_PORT_BASE` environment variable for setting the port range, as an alternative to the existing `--build-thread` option. (Bug #50182)

- `mysql-test-run.pl` now has a `--gprof` option that runs the server through the `gprof` profiler, much the same way the currently supported `--gcov` option runs it through `gcov`. (Bug #49345)

- `mysqltest` now has a `lowercase_result` command that converts the output of the next statement to lowercase. This is useful for test cases where the lettercase may vary between platforms. (Bug #48863)

- `mysqltest` now has a `remove_files_wildcard` command that removes files matching a pattern from a directory. (Bug #39774)

Bugs Fixed

- **InnoDB**: `SHOW INNODB STATUS` could display incorrect information about deadlocks, when the deadlock detection routine stops early (to avoid excessive CPU usage). (Bug #49001)

- **Partitioning**: Attempting to drop a partitioned table from one connection while waiting for the completion of an `ALTER TABLE` that had been issued from a different connection, and that changed the storage engine used by the table, could cause the server to crash. (Bug #42438)

- **Replication**: Adding an index to a table on the master caused the slave to stop logging slow queries to the slow query log. (Bug #50620)

- **Replication**: Queries written to the slow query log on the master were not written to the slow query log on the slave. (Bug #23300)

  References: See also Bug #48632.

- Running `SHOW CREATE TABLE` on a view `v1` that contained a function which accessed another view `v2` could trigger a infinite loop if the view referenced within the function (`v2`) caused a warning to be raised while being opened. (Bug #48449)

- An `.ARZ` file missing from the database directory caused the server to crash. (Bug #48757)
- If `EXPLAIN` encountered an error in the query, a memory leak occurred. (Bug #45989)
- `mysqltest` no longer permits you to execute an SQL statement on a connection after doing a `send` command, unless you do a `reap` first. This was previously accepted but could produce unpredictable results. (Bug #49269)
- `mysqld_multi` failed due to a syntax error in the script. (Bug #51468)
- For debug builds, `SHOW BINARY LOGS` raised an assertion if binary logging was not enabled. (Bug #50780)
- Full-text queries that used the truncation operator (`*`) could enter an infinite loop. (Bug #50351)
- For debug builds on Windows, warnings about incorrect use of debugging directives were written to the error log. The directives were rewritten to eliminate these messages. (Bug #49025)
- Slow `CALL` statements were not always logged to the slow query log because execution time for multiple-statement stored procedures was assessed incorrectly. (Bug #47905)
- The optimizer normally prefers use of `filesort` plus the join cache to a full index scan. But this combination was used even if the index is clustered, in which case, the clustered index scan can be faster. (Bug #50843)
- Incorrect handling of `BIT` columns in temporary tables could lead to spurious duplicate-key errors. (Bug #50591)
- Referring to a subquery result in a `HAVING` clause could produce incorrect results. (Bug #50995)
- Failure to open a view with a nonexistent `DEFINER` was improperly handled and the server crashed later attempting to lock the view. (Bug #47734)
- Valgrind warnings about uninitialized variables in optimizer code were corrected. (Bug #45195)
- Propagation of a large unsigned numeric constant in `WHERE` expressions could lead to incorrect results. This also affected `EXPLAIN EXTENDED`, which printed incorrect numeric constants in such transformed `WHERE` expressions. (Bug #45360)
- Grouping by a subquery in a query with a `DISTINCT` aggregate function led to incorrect and unordered grouping values. (Bug #45640)
- The server did not recognize that the stored procedure cache became invalid if a view was created or modified within a procedure, resulting in a crash. (Bug #50624)
- The second or subsequent invocation of a stored procedure containing `DROP TRIGGER` could cause a server crash. (Bug #50423)
- For debug builds, an assertion was incorrectly raised in the optimizer when matching `ORDER BY` expressions. (Bug #50335)
- Queries optimized with `GROUP_MIN_MAX` did not clean up `KEYREAD` optimizations properly, causing subsequent queries to return incomplete rows. (Bug #49902)
- For dynamic format `MyISAM` tables containing `LONGTEXT` columns, a bulk `INSERT ... ON DUPLICATE KEY UPDATE` or bulk `REPLACE` could cause corruption. (Bug #49628)
- For debug builds, with `sql_safe_updates` [526] enabled, a multiple-table `UPDATE` with the `IGNORE` modifier could raise an assertion. (Bug #49534)
- For debug builds, killing a `SELECT` retrieving from a view that was processing a function raised an assertion. (Bug #47736)
- For debug builds, creating a view containing a row constructor raised an assertion. (Bug #48294)

- Invalid memory reads could occur following a query that referenced a `MyISAM` table multiple times with a write lock. (Bug #48438)
- `EXPLAIN EXTENDED` crashed trying to print column names for a subquery in the `FROM` clause when the table had gone out of scope. (Bug #49487)
- For `InnoDB` tables, the test for using an index for `ORDER BY` sorting did not distinguish between primary keys and secondary indexes and expected primary key values to be concatenated to index values the way they are to secondary key values. (Bug #49324)
- `flush_cache_records()` did not correctly check for errors that should cause statement execution to stop, leading to a server crash. (Bug #39022)
- `InnoDB` logged an error repeatedly trying to load a page into the buffer pool, filling the error log and using excessive disk space. Now the number of attempts is limited to 100, after which the operation aborts with a message. (Bug #38901)
- When building MySQL when using a different target directory (for example using the `VPATH` environment variable), the build of the embedded `readline` component failed. (Bug #35250)
- `INSERT INTO ... VALUES(DEFAULT)` failed to insert the correct value for `ENUM` columns. For `MyISAM` tables, an empty value was inserted. For `CSV` tables, the table became corrupt. (Bug #33717)

Changes in MySQL 5.1.44 (2010-02-04)

InnoDB Plugin Notes

- This release includes `InnoDB Plugin` 1.0.6. This version is considered of Release Candidate (RC) quality.

  In this release, the `InnoDB Plugin` is included in source and binary distributions, except RHEL3, RHEL4, SuSE 9 (x86, x86_64, ia64), and generic Linux RPM packages. It also does not work for FreeBSD 6 and HP-UX or for Linux on generic ia64.

Functionality Added or Changed

- **Replication**: Introduced the `binlog_direct_non_transactional_updates` [1653] system variable. Enabling this variable causes updates using the statement-based logging format to tables using nontransactional engines to be written directly to the binary log, rather than to the transaction cache.

  Before enabling this variable, be certain that you have no dependencies between transactional and nontransactional tables. A statement that both selects from an `InnoDB` table and inserts into a `MyISAM` table is an example of such a dependency. For more information, see Binary Log Options and Variables. (Bug #46364)

  References: See also Bug #28976, Bug #40116.

Bugs Fixed

- **Performance**: The `MD5()` [1030] and `SHA1()` [1031] functions had excessive overhead for short strings. (Bug #49491, Bug #11757443, Bug #60227, Bug #14134662)
- **Performance**: The method for comparing `INFORMATION_SCHEMA` names and database names was nonoptimal and an improvement was made: When the database name length is already known, a length check is made first and content comparison skipped if the lengths are unequal. (Bug #49501)
- **Partitioning**: **InnoDB**: When an `ALTER TABLE ... REORGANIZE PARTITION` statement on an `InnoDB` table failed due to `innodb_lock_wait_timeout` [1371] expiring while waiting for a lock, `InnoDB` did not clean up any temporary files or tables which it had created. Attempting to reissue

the `ALTER TABLE` statement following the timeout could lead to storage engine errors, or possibly a crash of the server. (Bug #47343)

- **InnoDB**: Creating or dropping a table with 1023 transactions active caused an assertion failure. (Bug #49238)
- **InnoDB**: If `innodb_force_recovery` [1370] was set to 4 or higher, the server could crash when opening an `InnoDB` table containing an auto-increment column. MySQL versions 5.1.31 and later were affected. (Bug #46193)
- **Replication**: In some cases, inserting into a table with many columns could cause the binary log to become corrupted. (Bug #50018)

  References: See also Bug #42749.
- **Replication**: When using row-based replication, setting a `BIT` or `CHAR` column of a `MyISAM` table to `NULL`, then trying to delete from the table, caused the slave to fail with the error `Can't find record in table`. (Bug #49481, Bug #49482)
- **Replication**: When logging in row-based mode, DDL statements are actually logged as statements; however, statements that affected temporary tables and followed DDL statements failed to reset the binary log format to `ROW`, with the result that these statements were logged using the statement-based format. Now the state of `binlog_format` [1654] is restored after a DDL statement has been written to the binary log. (Bug #49132)
- **Replication**: When using row-based logging, the statement `CREATE TABLE t IF NOT EXIST ... SELECT` was logged as `CREATE TEMPORARY TABLE t IF NOT EXIST ... SELECT` when `t` already existed as a temporary table. This was caused by the fact that the temporary table was opened and the results of the `SELECT` were inserted into it when a temporary table existed and had the same name.

  Now, when this statement is executed, `t` is created as a base table, the results of the `SELECT` are inserted into it—even if there already exists a temporary table having the same name—and the statement is logged correctly. (Bug #47418)

  References: See also Bug #47442.
- **Replication**: Due to a change in the size of event representations in the binary log, when replicating from a MySQL 4.1 master to a slave running MySQL 5.0.60 or later, the `START SLAVE UNTIL` statement did not function correctly, stopping at the wrong position in the log. Now the slave detects that the master is using the older version of the binary log format, and corrects for the difference in event size, so that the slave stops in the correct position. (Bug #47142)
- The `printstack` function does not exist on Solaris 8 or earlier, which led to a compilation failure. (Bug #50409)
- The SSL certificates in the test suite were about to expire. They have been updated with expiration dates in the year 2015. (Bug #50642)
- Debug output for join structures was garbled. (Bug #50271)
- A user could see tables in `INFORMATION_SCHEMA.TABLES` without appropriate privileges for them. (Bug #50276)
- `mysql-test-run.pl` now recognizes the `MTR_TESTCASE_TIMEOUT`, `MTR_SUITE_TIMEOUT`, `MTR_SHUTDOWN_TIMEOUT`, and `MTR_START_TIMEOUT` environment variables. If they are set, their values are used to set the `--testcase-timeout`, `--suite-timeout`, `--shutdown-timeout`, and `--start-timeout` options, respectively. (Bug #49210)
- Mixing full-text searches and row expressions caused a crash. (Bug #49445)
- The `filesort` sorting method applied to a `CHAR(0)` column could lead to a server crash. (Bug #49897)

- `sql_buffer_result` [525] had an effect on non-`SELECT` statements, contrary to the documentation. (Bug #49552)
- In some cases a subquery need not be evaluated because it returns only aggregate values that can be calculated from table metadata. This sometimes was not handled by the enclosing subquery, resulting in a server crash. (Bug #49512)
- The optimizer could continue to execute a query after a storage engine reported an error, leading to a server crash. (Bug #46175)

Changes in MySQL Enterprise 5.1.43sp1 [QSP] (2010-03-25)

This is a *Service Pack* release of the MySQL Enterprise Server 5.1.

Bugs Fixed

- **Partitioning**: **InnoDB**: When an `ALTER TABLE ... REORGANIZE PARTITION` statement on an `InnoDB` table failed due to `innodb_lock_wait_timeout` [1371] expiring while waiting for a lock, `InnoDB` did not clean up any temporary files or tables which it had created. Attempting to reissue the `ALTER TABLE` statement following the timeout could lead to storage engine errors, or possibly a crash of the server. (Bug #47343)
- **InnoDB**: If `innodb_force_recovery` [1370] was set to 4 or higher, the server could crash when opening an `InnoDB` table containing an auto-increment column. MySQL versions 5.1.31 and later were affected. (Bug #46193)
- The `filesort` sorting method applied to a `CHAR(0)` column could lead to a server crash. (Bug #49897)
- `sql_buffer_result` [525] had an effect on non-`SELECT` statements, contrary to the documentation. (Bug #49552)
- In some cases a subquery need not be evaluated because it returns only aggregate values that can be calculated from table metadata. This sometimes was not handled by the enclosing subquery, resulting in a server crash. (Bug #49512)
- Referring to a subquery result in a `HAVING` clause could produce incorrect results. (Bug #50995)
- `flush_cache_records()` did not correctly check for errors that should cause statement execution to stop, leading to a server crash. (Bug #39022)

Changes in MySQL 5.1.43 (2010-01-15)

InnoDB Plugin Notes

- This release includes `InnoDB Plugin` 1.0.6. This version is considered of Release Candidate (RC) quality.

  In this release, the `InnoDB Plugin` is included in source and binary distributions, except RHEL3, RHEL4, SuSE 9 (x86, x86_64, ia64), and generic Linux RPM packages. It also does not work for FreeBSD 6 and HP-UX or for Linux on S/390, PowerPC, and generic ia64.

Functionality Added or Changed

- **Partitioning**: The `UNIX_TIMESTAMP()` [995] function is now supported in partitioning expressions using `TIMESTAMP` columns. For example, it now possible to create a partitioned table such as this one:

```
CREATE TABLE t (c TIMESTAMP)
PARTITION BY RANGE ( UNIX_TIMESTAMP(c) ) (
    PARTITION p0 VALUES LESS THAN (631148400),
    PARTITION p1 VALUES LESS THAN (946681200),
```

```
    PARTITION p2 VALUES LESS THAN (MAXVALUE)
);
```

All other expressions involving `TIMESTAMP` values are now rejected with an error for attempts to create a new partitioned table or to alter an existing partitioned table.

When accessing an existing partitioned table having a timezone-dependent partitioning function (where the table was using a previous version of MySQL), a warning rather than an error is issued. In such cases, you should fix the table. One way of doing this is to alter the table's partitioning expression so that it uses `UNIX_TIMESTAMP()` [995]. (Bug #42849)

Bugs Fixed

- **Security Fix**: For servers built with yaSSL, a preauthorization buffer overflow could cause memory corruption or a server crash. We thank Evgeny Legerov from Intevydis for providing us with a proof-of-concept script that permitted us to reproduce this bug. (Bug #50227, CVE-2009-4484)
- **Performance**: **Partitioning**: When used on partitioned tables, the `records_in_range` handler call checked more partitions than necessary. The fix for this issue reduces the number of unpruned partitions checked for statistics in partition range checking, which has resulted in some partition operations being performed up to 2-10 times faster than before this change was made, when testing with tables having 1024 partitions. (Bug #48846)

  References: See also Bug #37252, Bug #47261.
- **Important Change**: **Replication**: The `RAND()` [975] function is now marked as unsafe for statement-based replication. Using this function now generates a warning when `binlog_format=STATEMENT` [1654] and causes the format to switch to row-based logging when `binlog_format=MIXED` [1654].

  This change is being introduced because, when `RAND()` [975] was logged in statement mode, the seed was also written to the binary log, so the replication slave generated the same sequence of random numbers as was generated on the master. While this could make replication work in some cases, the order of affected rows was still not guaranteed when this function was used in statements that could update multiple rows, such as `UPDATE` or `INSERT ... SELECT`; if the master and the slave retrieved rows in different order, they began to diverge. (Bug #49222)
- **InnoDB**: When compiling on Windows, an error in the `CMake` definitions for `InnoDB` caused the engine to be built incorrectly. (Bug #49502)
- **InnoDB**: The `InnoDB Monitor` could fail to print diagnostic information after a long lock wait. (Bug #47814)
- **InnoDB**: Crash recovery did not work for `InnoDB` temporary tables. (Bug #41609)
- **Partitioning**: A query that searched on a `ucs2` column failed if the table was partitioned. (Bug #48737)
- **Replication**: A `LOAD DATA INFILE` statement that loaded data into a table having a column name that had to be quoted (such as `` `key` INT``) caused replication to fail when logging in mixed or statement mode. In such cases, the master wrote the `LOAD DATA` event into the binary log without quoting the column name. (Bug #49479)

  References: See also Bug #47927. This bug is a regression of Bug #43746.
- **Replication**: A flaw in the implementation of the purging of binary logs could result in orphaned files being left behind in the following circumstances:

  - If the server failed or was killed while purging binary logs.

    If the server failed or was killed after creating of a new binary log when the new log file was opened for the first time.

In addition, if the slave was not connected during the purge operation, it was possible for a log file that was in use to be removed; this could lead data loss and possible inconsistencies between the master and slave. (Bug #45292)

- **Replication**: Spatial data types caused row-based replication to crash. (Bug #48776)
- **Replication**: When using the `STATEMENT` or `MIXED` logging format, the statements `LOAD DATA CONCURRENT LOCAL INFILE` and `LOAD DATA CONCURRENT INFILE` were logged as `LOAD DATA LOCAL INFILE` and `LOAD DATA LOCAL INFILE`, respectively (in other words, the `CONCURRENT` keyword was omitted). As a result, when using replication with either of these logging modes, queries on the slaves were blocked by the replication SQL thread while trying to execute the affected statements. (Bug #34628)
- **Replication**: Manually removing entries from the binary log index file on a replication master could cause the server to repeatedly send the same binary log file to slaves. (Bug #28421)
- **Cluster Replication**: When `expire_logs_days` [474] was set, the thread performing the purge of the log files could deadlock, causing all binary log operations to stop. (Bug #49536)
- A Valgrind error in `make_cond_for_table_from_pred()` was corrected. Thanks to Sergey Petrunya for the patch to fix this bug. (Bug #49506)
- Valgrind warnings for `CHECKSUM TABLE` were corrected. (Bug #49465)
- On Solaris, the server printed no stack trace to the error log after a crash. (Bug #47391)
- The error message for `ER_UPDATE_INFO` [3965] was subject to buffer overflow or truncation. (Bug #48500)
- Specifying an index algorithm (such as `BTREE`) for `SPATIAL` or `FULLTEXT` indexes caused a server crash. These index types do not support algorithm specification, and it is not longer permitted to do so. (Bug #49250)
- The optimizer sometimes incorrectly handled conditions of the form `WHERE col_name='const1' AND col_name='const2'`. (Bug #49199)
- The `LIKE` [959] operator did not work correctly when using an index for a `ucs2` column. (Bug #49028)
- Execution of `DECODE()` [1029] and `ENCODE()` [1030] could be inefficient because multiple executions within a single statement reinitialized the random generator multiple times even with constant parameters. (Bug #49141)
- `check_key_in_view()` was missing a `DBUG_RETURN` in one code branch, causing a crash in debug builds. (Bug #48995)
- It was possible for `init_available_charsets()` not to initialize correctly. (Bug #45058)
- With binary logging enabled, `REVOKE ... ON {PROCEDURE|FUNCTION} FROM ...` could cause a crash. (Bug #49119)
- Re-execution of a prepared statement could cause a server crash. (Bug #48508)
- `SHOW BINLOG EVENTS` could fail with a error: `Wrong offset or I/O error`. (Bug #48357)
- Valgrind warnings related to binary logging of `LOAD DATA INFILE` statements were corrected. (Bug #48340)
- The first execution of `STOP SLAVE UNTIL` stopped too early. (Bug #47210)
- If an invocation of a stored procedure failed in the table-open stage, subsequent invocations that did not fail in that stage could cause a crash. (Bug #47649)

- When the `mysql` client was invoked with the `--vertical` [266] option, it ignored the `--skip-column-names` [265] option. (Bug #47147)
- Incomplete reset of internal `TABLE` structures could cause a crash with `eq_ref` [697] table access in subqueries. (Bug #48709)
- The `push_warning_printf()` function was being called with an invalid error level, `MYSQL_ERROR::WARN_LEVEL_ERROR`, causing an assertion failure. To fix the problem, `MYSQL_ERROR::WARN_LEVEL_ERROR` has been replaced by `MYSQL_ERROR::WARN_LEVEL_WARN`. (Bug #49638)
- On Fedora 12, `strmov()` did not guarantee correct operation for overlapping source and destination buffer. Calls were fixed to use an overlap-safe version instead. (Bug #48866)
- Queries containing `GROUP BY ... WITH ROLLUP` that did not use indexes could return incorrect results. (Bug #47650)
- An aliasing violation in the C API could lead to a crash. (Bug #48284)
- MySQL 5.1 does not support 2-byte collation numbers, but did not check the number and crashed for out-of-range values. (Bug #49134)
- Within a stored routine, selecting the result of `CONCAT_WS()` [951] with a routine parameter argument into a user variable could return incorrect results. (Bug #50096)
- Several `strmake()` calls had an incorrect length argument (too large by one). (Bug #48983)
- Some prepared statements could raise an assertion when re-executed. (Bug #49570)
- `EXPLAIN EXTENDED UNION ... ORDER BY` caused a crash when the `ORDER BY` referred to a nonconstant or full-text function or a subquery. (Bug #49734)
- The `IBMDB2I` storage engine was missing from the i5os 64-bit distribution of MySQL 5.1.42. It is now included again. (Bug #50059)
- With one thread waiting for a lock on a table, if another thread dropped the table and created a new table with the same name and structure, the first thread did not notice that the table had been re-created and tried to used cached metadata that belonged to the old table but had been freed. (Bug #48157)
- A crash occurred when a user variable that was assigned to a subquery result was used as a result field in a `SELECT` statement with aggregate functions. (Bug #47371)
- Comparison with `NULL` values sometimes did not produce a correct result. (Bug #42760)
- The `mysql_upgrade` command added three columns to the `mysql.proc` table (`character_set_client`, `collation_connection` [466], and `db_collation`), but did not populate the columns with correct values. This led to error messages reported during stored procedure execution. (Bug #41569)
- When compressed `MyISAM` files were opened, they were always memory mapped, sometimes causing memory-swapping problems. To deal with this, a new system variable, `myisam_mmap_size`, was added to permit limiting the amount of memory used for memory mapping of `MyISAM` files. (Bug #37408)
- For a `VARCHAR(N)` column, `ORDER BY BINARY(col_name)` sorted using only the first `N` bytes of the column, even though column values could be longer than `N` bytes if they contained multi-byte characters. (Bug #44131)
- A race condition on the privilege hash tables permitted one thread to try to delete elements that had already been deleted by another thread. A consequence was that `SET PASSWORD` or `FLUSH PRIVILEGES` could cause a crash. (Bug #35589, Bug #35591)

- `ALTER TABLE` with both `DROP COLUMN` and `ADD COLUMN` clauses could crash or lock up the server. (Bug #31145)

Changes in MySQL 5.1.42 (2009-12-15)

Release availability

- MySQL Server 5.1 is available on the following new platforms starting with the 5.1.42 release:
  - Mac OS X 10.6 x86/x64
  - HP-UX 11.31 IA64
  - SLES 11 x86/x64

InnoDB Plugin Notes

- `InnoDB Plugin` has been upgraded to version 1.0.6. This version is considered of Release Candidate (RC) quality. InnoDB Storage Engine Change History, may contain information in addition to those changes reported here.

  In this release, the `InnoDB Plugin` is included in source and binary distributions, except RHEL3, RHEL4, SuSE 9 (x86, x86_64, ia64), and generic Linux RPM packages. It also does not work for FreeBSD 6 and HP-UX or for Linux on S/390, PowerPC, and generic ia64.

Bugs Fixed

- **Performance**: When the query cache is fragmented, the size of the free block lists in the memory bins grows, which causes query cache invalidation to become slow. There is now a 50ms timeout for a `SELECT` statement waiting for the query cache lock. If the timeout expires, the statement executes without using the query cache. (Bug #39253)

  References: See also Bug #21074.

- **Important Change**: **Replication**: The following functions have been marked unsafe for statement-based replication:
  - `GET_LOCK()` [1040]
  - `IS_FREE_LOCK()` [1041]
  - `IS_USED_LOCK()` [1042]
  - `MASTER_POS_WAIT()` [1042]
  - `RELEASE_LOCK()` [1042]
  - `SLEEP()` [1042]
  - `SYSDATE()` [992]
  - `VERSION()` [1039]

  None of the functions just listed are guaranteed to replicate correctly when using the statement-based format because they can produce different results on the master and the slave. The use of any of these functions while `binlog_format` [1654] is set to `STATEMENT` is logged with the warning, `Statement is not safe to log in statement format`. When `binlog_format` [1654] is set to `MIXED`, the binary logging format is automatically switched to the row-based format whenever one of these functions is used. (Bug #47995)

- **Important Change**: After a binary upgrade to MySQL 5.1 from a MySQL 5.0 installation that contains `ARCHIVE` tables:

  - Before MySQL 5.1.42, accessing those tables will cause the server to crash, even if you have run `mysql_upgrade` or `CHECK TABLE ... FOR UPGRADE`.
  - As of MySQL 5.1.42, the server will not open 5.0 `ARCHIVE` tables at all.

  In either case, the solution is to use `mysqldump` to dump all 5.0 `ARCHIVE` tables before upgrading, and reload them into MySQL 5.1 after upgrading. The same problem occurs for binary downgrades from MySQL 5.1 to 5.0. (Bug #47012)

- **Partitioning**: In some cases, it was not possible to add a new column to a table that had subpartitions. (Bug #48276)
- **Partitioning**: `SELECT COUNT(*)` from a partitioned table failed when using the `ONLY_FULL_GROUP_BY` SQL mode. (Bug #46923)

  References: This bug was introduced by Bug #45807.
- **Partitioning**: `SUBPARTITION BY KEY` failed with `DEFAULT CHARSET=utf8`. (Bug #45904)
- **Replication**: When using row-based logging, `TRUNCATE TABLE` was written to the binary log even if the affected table was temporary, causing replication to fail. (Bug #48350)
- **Replication**: When using row-based format, replication failed with the error `Could not execute Write_rows event on table ...; Field '...' doesn't have a default value` when an `INSERT` was made on the master without specifying a value for a column having no default, even if strict server SQL mode was not in use and the statement would otherwise have succeeded on the master. Now the SQL mode is checked, and the statement is replicated unless strict mode is in effect. For more information, see Server SQL Modes. (Bug #38173)

  References: See also Bug #38262, Bug #43992.
- **Replication**: Replicating `TEXT` or `VARCHAR` columns declared as `NULL` on the master but `NOT NULL` on the slave caused the slave to crash. (Bug #43789)

  References: See also Bug #38850, Bug #43783, Bug #43785, Bug #47741, Bug #48091.
- Building MySQL on Fedora Core 12 64-bit failed, due to errors in `comp_err`. (Bug #48864)
- When running `mysql_secure_installation`, the command failed if the `root` password contained multiple space, `'\'`, `'#'`, or quote characters. (Bug #48031)
- Truncation of `DECIMAL` values could lead to assertion failures; for example, when deducing the type of a table column from a literal `DECIMAL` value. (Bug #45261)

- Valgrind errors for `InnoDB Plugin` were corrected. (Bug #45992, Bug #46656)
- Assignment of a system variable sharing the same base name as a declared stored program variable in the same context could lead to a crash. (Bug #47627)
- Privileges for stored routines were ignored for mixed-case routine names. (Bug #48872)

  References: See also Bug #41049.
- `DISTINCT` was ignored for queries with `GROUP BY WITH ROLLUP` and only `const` [696] tables. (Bug #48475)
- Loose index scan was inappropriately chosen for some `WHERE` conditions. (Bug #48472)

- The `innodb_file_format_check` [1366] system variable could not be set at runtime to `DEFAULT` or to the value of a user-defined variable. (Bug #47167)
- Concurrent `ALTER TABLE` operations on an `InnoDB` table could raise an assertion. (Bug #48782)
- During query execution, ranges could be merged incorrectly for `OR` [944] operations and return an incorrect result. (Bug #48665)
- The `InnoDB` Table Monitor reported the `FLOAT` and `DOUBLE` data types incorrectly. (Bug #48526)
- With row-based binary logging, the server crashed for statements of the form `CREATE TABLE IF NOT EXISTS existing_view LIKE temporary_table`. This occurred because the server handled the existing view as a table when logging the statement. (Bug #48506)
- A bad typecast could cause query execution to allocate large amounts of memory. (Bug #48458)
- `MATCH IN BOOLEAN MODE` searches could return too many results inside a subquery. (Bug #47930)
- Connecting to a 4.1.x server from a 5.1.x or higher `mysql` client resulted in a memory-free error when disconnecting. (Bug #47655)
- On 64-bit systems, `--skip-innodb` [1359] did not skip `InnoDB` startup. (Bug #46043)
- `mysql_secure_installation` did not work on Solaris. (Bug #48086)
- Parts of the range optimizer could be initialized incorrectly, resulting in Valgrind errors. (Bug #48459)
- The server could crash and corrupt the tablespace if the `InnoDB` tablespace was configured with too small a value, or if `innodb_file_per_table` [1367] was enabled and many `CREATE TEMPORARY TABLE` statements were executed and the temporary file directory filled up. (Bug #48469)
- The `mysql` client `status` command displayed an incorrect value for the server character set. (Bug #47671)
- Using `REPLACE` to update a previously inserted negative value in an `AUTO_INCREMENT` column of an `InnoDB` table caused the table auto-increment value to be updated to 2147483647. (Bug #47720)
- The `IGNORE` clause on a `DELETE` statement masked an SQL statement error that occurred during trigger processing. (Bug #46425)
- If a session acquired a global read lock with `FLUSH TABLES WITH READ LOCK`, acquired a lock for one table with `LOCK TABLES`, and issued an `INSERT DELAYED` statement for another table, deadlock could occur. (Bug #47682)
- The return value was not checked for some `my_hash_insert()` calls. (Bug #45613)
- The result of comparison between nullable `BIGINT` and `INT` columns was inconsistent. (Bug #49517)
- Incorrect cache initialization prevented storage of converted constant values and could produce incorrect comparison results. (Bug #49489)
- Comparisons involving `YEAR` values could produce incorrect results. (Bug #49480)

  References: See also Bug #43668.
- If a query involving a table was terminated with `KILL`, a subsequent `SHOW CREATE TABLE` for that table caused a server crash. (Bug #48985)
- The Mac OS X `MySQL Preference Pane` component was not built for 64-bit, which would trigger the System Preferences application to restart into 32-bit mode. (Bug #46935)
- `mysqladmin debug` could crash on 64-bit systems. (Bug #47382)

- Certain `INTERVAL` expressions could cause a crash on 64-bit systems. (Bug #48739)
- `GRANT` and `REVOKE` crashed if a user name was specified as `CURRENT_USER()` [1033]. (Bug #48319)
- Use of `InnoDB` monitoring (`SHOW ENGINE INNODB STATUS` or one of the `InnoDB` Monitor tables) could cause a server crash due to invalid access to a shared variable in a concurrent environment. This is a further fix for a regression introduced in MySQL 5.1.38 to the original fix in MySQL 5.1.31. (Bug #38883)
- Multiple-statement execution could fail. (Bug #40877)
- For `YEAR(2)` values, `MIN()` [1047], `MAX()` [1046], and comparisons could yield incorrect results. (Bug #43668)
- The server could crash when attempting to access a non-conformant `mysql.proc` system table. For example, the server could crash when invoking stored procedure-related statements after an upgrade from MySQL 5.0 to 5.1 without running `mysql_upgrade`. (Bug #41726)
- On Windows, the `mysql_secure_installation` command failed to load the `Term::ReadKey` module, which was required for correct operation. (Bug #35106)
- If the `--log-bin` [1647] server option was set to a directory name with a trailing component separator character, the basename of the binary log files was empty, so that the created files were named `.000001` and `.index`. The same thing occurred with the `--log-bin-index` [1648], `--relay-log` [1632], and `--relay-log-index` [1633] options. Now the server reports and error and exits. (Bug #34739)
- If a comparison involved a constant value that required type conversion, the converted value might not be cached, resulting in repeated conversion and poorer performance. (Bug #34384)
- Using the `SHOW ENGINE INNODB STATUS` statement when using partitions in `InnoDB` tables caused `Invalid (old?) table or database name` errors to be logged. (Bug #32430)
- On some Windows systems, `InnoDB` could report `Operating system error number 995 in a file operation` due to transient driver or hardware problems. `InnoDB` now retries the operation and adds `Retry attempt is made` to the error message. (Bug #3139)

Changes in MySQL 5.1.41 (2009-11-05)

InnoDB Plugin Notes

- `InnoDB Plugin` has been upgraded to version 1.0.5. This version is considered of Release Candidate (RC) quality. InnoDB Storage Engine Change History, may contain information in addition to those changes reported here.

Functionality Added or Changed

- **Incompatible Change**: For `InnoDB Plugin`, two status variables have been added: `Innodb_buffer_pool_read_ahead` [562] and `Innodb_buffer_pool_read_ahead_evicted` [563] indicate the number of pages read in by the `InnoDB` read-ahead background thread, and the number of such pages evicted without ever being accessed, respectively. Also, the status variables `Innodb_buffer_pool_read_ahead_rnd` and `Innodb_buffer_pool_read_ahead_seq` status variables have been removed.

  The built-in version of `InnoDB` is not affected by these changes. (Bug #42885)
- The `InnoDB` buffer pool is divided into two sublists: A new sublist containing blocks that are heavily used by queries, and an old sublist containing less-used blocks and from which candidates for eviction are taken. In the default operation of the buffer pool, a block when read in is loaded at the midpoint and then moved immediately to the head of the new sublist as soon as an access occurs. In the case of a table scan (such as performed for a `mysqldump` operation), each block read by the scan ends up moving to the head of the new sublist because multiple rows are accessed from

each block. This occurs even for a one-time scan, where the blocks are not otherwise used by other queries. Blocks may also be loaded by the read-ahead background thread and then moved to the head of the new sublist by a single access. These effects can be disadvantageous because they push blocks that are in heavy use by other queries out of the new sublist to the old sublist where they become subject to eviction.

`InnoDB` now provides two system variables that enable LRU algorithm tuning:

- `innodb_old_blocks_pct` [1377]

  Specifies the approximate percentage of the buffer pool used for the old block sublist. The range of values is 5 to 95. The default value is 37 (that is, 3/8 of the pool).

- `innodb_old_blocks_time` [1378]

  Specifies how long in milliseconds (ms) a block inserted into the old sublist must stay there after its first access before it can be moved to the new sublist. The default value is 0: A block inserted into the old sublist moves immediately to the new sublist the first time it is accessed, no matter how soon after insertion the access occurs. If the value is greater than 0, blocks remain in the old sublist until an access occurs at least that many ms after the first access. For example, a value of 1000 causes blocks to stay in the old sublist for 1 second after the first access before they become eligible to move to the new sublist.

See The `InnoDB` Buffer Pool. (Bug #45015)

- The server now supports a Debug Sync facility for thread synchronization during testing and debugging. To compile in this facility, configure MySQL with the `--enable-debug-sync` option. The `debug_sync` [470] system variable provides the user interface Debug Sync. `mysqld` and `mysql-test-run.pl` support a `--debug-sync-timeout` [424] option to enable the facility and set the default synchronization point timeout.

Bugs Fixed

- **Important Change**: **Security Fix**: Additional corrections were made for the symlink-related privilege problem originally addressed in MySQL 5.1.24. The original fix did not correctly handle the data directory path name if it contained symlinked directories in its path, and the check was made only at table-creation time, not at table-opening time later. (Bug #32167, CVE-2008-2079)

  References: See also Bug #39277.

- **Security Fix**: MySQL clients linked against OpenSSL could be tricked not to check server certificates. (Bug #47320, CVE-2009-4028)

- **InnoDB**: When a trigger inserts into a table containing an auto-increment column, an error `Error: Duplicate entry` could occur with the InnoDB Plugin if another insert was happening simultaneously. (Bug #26316)

- **Partitioning**: An `ALTER TABLE ... ADD PARTITION` statement that caused `open_files_limit` [508] to be exceeded led to a MySQL server crash. (Bug #46922)

  References: See also Bug #47343.

- **Partitioning**: The cardinality of indexes on partitioned tables was calculated using the first partition in the table, which could result in suboptimal query execution plans being chosen. Now the partition having the most records is used instead, which should result in better use of indexes and thus improved performance of queries against partitioned tables in many if not most cases. (Bug #44059)

- **Replication**: When using the row-based format to replicate a transaction involving both transactional and nontransactional engines, which contained a DML statement affecting multiple rows, the statement failed. If this transaction was followed by a `COMMIT`, the master and the slave could diverge, because the statement was correctly rolled back on the master, but was applied on the slave. (Bug #47287)

References: See also Bug #46864.

- **Replication**: A problem with the `BINLOG` statement in the output of `mysqlbinlog` could break replication; statements could be logged with the server ID stored within events by the `BINLOG` statement rather than the ID of the running server. With this fix, the server ID of the server executing the statements can no longer be overridden by the server ID stored in the binary log's `format description` statement. (Bug #46640)

  References: This bug was introduced by Bug #32407.

- **Replication**: When a session was closed on the master, temporary tables belonging to that session were logged with the wrong database names when either of the following conditions was true:

  1. The length of the name of the database to which the temporary table belonged was greater than the length of the current database name.

  2. The current database was not set.

  (Bug #48216)

  References: See also Bug #46861, Bug #48297.

- **Replication**: This issue occurred in MySQL 5.1.40 only. (Bug #48297)

- **Replication**: When `mysqlbinlog --verbose` [354] was used to read a binary log that had been written using row-based format, the output for events that updated some but not all columns of tables was not correct. (Bug #47323)

- **Replication**: When using row-based replication, changes to nontransactional tables that occurred early in a transaction were not immediately flushed upon committing a statement. This behavior could break consistency since changes made to nontransactional tables become immediately visible to other connections. (Bug #47678)

  References: See also Bug #47287, Bug #46864, Bug #43929, Bug #11752675, Bug #46129. This bug is a regression of Bug #40116.

- **Replication**: When using statement-based replication and the transaction isolation level was set to `READ COMMITTED` [1224] or a less strict level, `InnoDB` returned an error even if the statement in question was filtered out according to the `--binlog-do-db` [1649] or `--binlog-ignore-db` [1651] rules in effect at the time. (Bug #42829)

- **Replication**: `FLUSH LOGS` did not close and reopen the binary log index file. (Bug #34582)

  References: See also Bug #48738.

- If `InnoDB Plugin` reached its limit on the number of concurrent transactions (1023), it wrote a descriptive message to the error log but returned a misleading error message to the client, or an assertion failure occurred. (Bug #46672)

  References: See also Bug #18828.

- The Windows build for MySQL would compile the `split.c` and `debug.c` files unnecessarily, causing additional symbols to be included in `mysqld`. (Bug #47850)

- When building a pluggable storage engine on Windows, the engine name could be based on the directory name where the engine was located, rather than the configured storage engine name. (Bug #47795)

- The `mysys/mf_strip.c` file, which defines the `strip_sp()` function, has been removed from the MySQL source. The function was no longer used within the main build, and the supplied function was causing symbol errors on Windows builds. (Bug #47857)

- When building storage engines on Windows it was not possible to specify additional libraries within the `CMake` file required for the build. An `${engine}_LIBS` macro has been included in the files to support these additional storage-engine specific libraries. (Bug #47797)

- A query containing a view using temporary tables and multiple tables in the `FROM` clause and `PROCEDURE ANALYSE()` caused a server crash.

  As a result of this bug fix, `PROCEDURE ANALYSE()` is legal only in a top-level `SELECT`. (Bug #48293)

  References: See also Bug #46184.

- Concurrent `INSERT INTO ... SELECT` statements for an `InnoDB` table could cause an `AUTO_INCREMENT` assertion failure. (Bug #46650)

- An assertion could be raised for `CREATE TABLE` if there was a pending `INSERT DELAYED` or `REPLACE DELAYED` for the same table. (Bug #47274)

- `InnoDB` did not disallow creation of an index with the name `GEN_CLUST_INDEX`, which is used internally. (Bug #46000)

- Incorrect handling of predicates involving `NULL` by the range optimizer could lead to an infinite loop during query execution. (Bug #47123)

- A simple `SELECT` with implicit grouping could return many rows rather than a single row if the query was ordered by the aggregated column in the select list. (Bug #47280)

- During the build of the Red Hat IA64 MySQL server RPM, the system library link order was incorrect. This made the resulting Red Hat IA64 RPM depend on "libc.so.6.1(GLIBC_PRIVATE)(64bit)", thus preventing installation of the package. (Bug #45706)

- A build configured using the `--without-server` option did not compile the yaSSL code, so if `--with-ssl` was also used, the build failed. (Bug #47957)

- `mysys/mf_keycache.c` requires threading, but no test was made for thread support. (Bug #47923)

- The GPL and commercial license headers had different sizes, so that error log, backtrace, core dump, and cluster trace file line numbers could be off by one if they were not checked against the version of the source used for the build. (For example, checking a GPL build backtrace against commercial sources.) (Bug #46216)

- Repair by sort or parallel repair of `MyISAM` tables might not fail over to repair with key cache. (Bug #47073)

- Trailing spaces were not ignored for user-defined collations that mapped spaces to a character other than 0x20. (Bug #46448)

  References: See also Bug #29468.

- On Windows, when an idle named pipe connection was forcibly closed with a `KILL` statement or because the server was being shut down, the thread that was closing the connection would hang infinitely.

  As a result of the work done for this bug, the `net_read_timeout` [505], `net_write_timeout` [506], and `wait_timeout` [538], system variables now apply to connections over all transports, not just to TCP/IP. (Bug #47571, Bug #31621)

- A function call could end without throwing an error or setting the return value. For example, this could happen when an error occurred while calculating the return value. This is fixed by setting the value to `NULL` when an error occurs during evaluation of an expression. (Bug #47412)

- If a transaction was rolled back inside `InnoDB` due to a deadlock or lock wait timeout, and a statement in the transaction had an `IGNORE` clause, the server could crash at the end of the statement or on shutdown. (Bug #46539)
- During cleanup of a stored procedure's internal structures, the flag to ignore the errors for `INSERT IGNORE` or `UPDATE IGNORE` was not cleaned up, which could result in a server crash. (Bug #47788)
- Error handling was missing for `SELECT` statements containing subqueries in the `WHERE` clause and that assigned a `SELECT` result to a user variable. The server could crash as a result. (Bug #48291)
- `InnoDB` could crash when updating spatial values. (Bug #47777)
- If the first argument to `GeomFromWKB()` [1061] function was a geometry value, the function just returned its value. However, it failed to preserve the argument's `null_value` flag, which caused an unexpected `NULL` value to be returned to the caller, resulting in a server crash. (Bug #47780)
- An assertion could fail if the optimizer used a `SPATIAL` index. (Bug #48258, Bug #47019)
- For debug builds, an assertion could fail during the next statement executed for a temporary table after a multiple-table `UPDATE` involving that table modified an `AUTO_INCREMENT` column with a user-supplied value. (Bug #47919)
- The `caseinfo` member of the `CHARSET_INFO` structure was not initialized for user-defined Unicode collations, leading to a server crash. (Bug #45645)
- On Windows, when a failed I/O operation occurred with return code of `ERROR_WORKING_SET_QUOTA`, `InnoDB` intentionally crashed the server. Now `InnoDB` sleeps for 100ms and retries the failed operation. (Bug #47055)
- A combination of `GROUP BY WITH ROLLUP`, `DISTINCT` and the `const` [696] join type in a query caused a server crash when the optimizer used a temporary table to resolve `DISTINCT`. (Bug #48131)
- When MySQL crashed (or a snapshot was taken that simulates a crash), it was possible that internal XA transactions (used to synchronize the binary log and `InnoDB`) could be left in a `PREPARED` state, whereas they should be rolled back. This occurred when the `server_id` [521] value changed before the restart, because that value was used to construct XID values.

  Now the restriction is relaxed that the `server_id` [521] value be consistent for XID values to be considered valid. The rollback phase should then be able to clean up all pending XA transactions. (Bug #46944)
- In some cases, using a null microsecond part in a `WHERE` condition (for example, `WHERE date_time_field <= 'YYYY-MM-DD HH:MM:SS.0000'`) could lead to incorrect results due to improper `DATETIME` comparison. (Bug #47963)
- `SUM()` [1047] artificially increased the precision of a `DECIMAL` argument, which was truncated when a temporary table was created to hold the results. (Bug #48370)

  References: See also Bug #45261.
- `InnoDB` mishandled memory-allocation failures in the `os_mem_alloc_large()` function. (Bug #48237)
- `WHERE` clauses with *`outer_value_list NOT IN subquery`* were handled incorrectly if the outer value list contained multiple items at least one of which could be `NULL`. (Bug #48177)
- If an outer query was invalid, a subquery might not be set up. `EXPLAIN EXTENDED` did not expect this and caused a crash by trying to dereference improperly set up information. (Bug #48295)
- When a query used a `DATE` or `DATETIME` value formatted using any separator characters other than hyphen (`'-'`) and a `>=` condition matching only the greatest value in an indexed column, the result was empty if an index range scan was employed. (Bug #47925)

- If an InnoDB table was created with the AUTO_INCREMENT table option to specify an initial auto-increment value, and an index was added in a separate operation later, the auto-increment value was lost (subsequent inserts began at 1 rather than the specified value). (Bug #47125)
- InnoDB Plugin did not compile on some Solaris systems. (Bug #47058)
- InnoDB Plugin did not compile using gcc 4.1 on PowerPC systems. (Bug #46718)
- InnoDB raised errors in some cases in a manner not compatible with SIGNAL and RESIGNAL. (Bug #47233)
- InnoDB now ignores negative values supplied by a user for an AUTO_INCREMENT column when calculating the next value to store in the data dictionary. Setting AUTO_INCREMENT columns to negative values is undefined behavior and this change should bring the behavior of InnoDB closer to what users expect. (Bug #46965)
- A Valgrind error during index creation by InnoDB Plugin was corrected. (Bug #46657)
- Previously, InnoDB performed REPLACE INTO T SELECT ... FROM S WHERE ... by setting shared next-key locks on rows from S. Now InnoDB selects rows from S with shared locks or as a consistent read, as for INSERT ... SELECT. This reduces lock contention between sessions. (Bug #37232)
- Failure to treat BIT values as unsigned could lead to unpredictable results. (Bug #42803)
- Incorrect handling of range predicates combined with OR [944] operators could yield incorrect results. (Bug #42846)
- The FORCE INDEX FOR ORDER BY index hint was ignored when join buffering was used. (Bug #43029)
- With InnoDB Plugin, renaming a table column and then creating an index on the renamed column caused a server crash due to the .frm file and the InnoDB data directory going out of sync. Now InnoDB Plugin 1.0.5 returns an error instead: ERROR 1034 (HY000): Incorrect key file for table '*tbl_name*'; try to repair it. To work around the problem, create another table with the same structure and copy the original table to it. (Bug #44571)
- An InnoDB error message incorrectly referred to the nonexistent innodb_max_files_open variable rather than to innodb_open_files [1378]. (Bug #44338)
- The weekday names for the Romanian lc_time_names [487] locale 'ro_RO' were incorrect. Thanks to Andrei Boros for the patch to fix this bug. (Bug #43207)
- For ALTER TABLE, renaming a DATETIME or TIMESTAMP column unnecessarily caused a table copy operation. (Bug #43508)
- For the embedded server on Windows, InnoDB crashed when innodb_file_per_table [1367] was enabled and a table name was in full path format. (Bug #42383)
- Simultaneous ANALYZE TABLE operations for an InnoDB tables could be subject to a race condition. (Bug #38996)
- With a nonstandard InnoDB page size, some error messages became inaccurate.

Note

Changing the page size is not a supported operation and there is no guarantee that InnoDB will function normally with a page size other than 16KB. Problems compiling or running InnoDB may occur. In particular, ROW_FORMAT=COMPRESSED in the InnoDB Plugin assumes that the page size is at most 16KB and uses 14-bit pointers.

> A version of `InnoDB` built for one page size cannot use data files or log files from a version built for a different page size.

(Bug #41490)

- In a replication scenario with `innodb_locks_unsafe_for_binlog` [1372] enabled on the slave, where rows were changed only on the slave (not through replication), in some rare cases, many messages of the following form were written to the slave error log: `InnoDB: Error: unlock row could not find a 4 mode lock on the record`. (Bug #41756)

- `XA START` could cause an assertion failure or server crash when it is called after a unilateral rollback issued by the Resource Manager (both in a regular transaction and after an XA transaction). (Bug #43171)

- Some queries with nested outer joins could lead to crashes or incorrect results because an internal data structure was handled improperly. (Bug #42116)

- After renaming a user, granting that user privileges could result in the user having privileges additional to those granted. (Bug #41597)

- In some cases, the server did not recognize lettercase differences between `GRANT` attributes such as table name or user name. For example, a user was able to perform operations on a table with privileges of another user with the same user name but in a different lettercase.

  In consequence of this bug fix, the collation for the `Routine_name` column of the `mysql.proc` table is changed from `utf8_bin` to `utf8_general_ci`. (Bug #41049)

  References: See also Bug #48872.

- When an `InnoDB` tablespace filled up, an error was logged to the client, but not to the error log. Also, the error message was misleading and did not indicate the real source of the problem. (Bug #31183)

- In `mysql`, using **Control+C** to kill the current query resulted in a `ERROR 1053 (08S01): Server shutdown in progress" message` if the query was waiting for a lock. (Bug #28141)

Changes in MySQL Enterprise 5.1.40sp1 [QSP] (2009-11-25)

This is a *Service Pack* release of the MySQL Enterprise Server 5.1.

Bugs Fixed

- **Replication**: When a session was closed on the master, temporary tables belonging to that session were logged with the wrong database names when either of the following conditions was true:

  1. The length of the name of the database to which the temporary table belonged was greater than the length of the current database name.

  2. The current database was not set.

  (Bug #48216)

  References: See also Bug #46861, Bug #48297.

- **Replication**: When using statement-based or mixed-format replication, the database name was not written to the binary log when executing a `LOAD DATA INFILE` statement. This caused problems when the table being loaded belonged to a database other than the current database; data could be loaded into the wrong table (if a table having the same name existed in the current database) or replication could fail (if no table having that name existed in the current database). Now a table referenced in a `LOAD DATA INFILE` statement is always logged using its fully qualified name when the database to which it belongs is not the current database. (Bug #48297)

- A query containing a view using temporary tables and multiple tables in the `FROM` clause and `PROCEDURE ANALYSE()` caused a server crash.

  As a result of this bug fix, `PROCEDURE ANALYSE()` is legal only in a top-level `SELECT`. (Bug #48293)

  References: See also Bug #46184.

- Incorrect handling of predicates involving `NULL` by the range optimizer could lead to an infinite loop during query execution. (Bug #47123)

- During cleanup of a stored procedure's internal structures, the flag to ignore the errors for `INSERT IGNORE` or `UPDATE IGNORE` was not cleaned up, which could result in a server crash. (Bug #47788)

- Error handling was missing for `SELECT` statements containing subqueries in the `WHERE` clause and that assigned a `SELECT` result to a user variable. The server could crash as a result. (Bug #48291)

- `InnoDB` could crash when updating spatial values. (Bug #47777)

- If the first argument to `GeomFromWKB()` [1061] function was a geometry value, the function just returned its value. However, it failed to preserve the argument's `null_value` flag, which caused an unexpected `NULL` value to be returned to the caller, resulting in a server crash. (Bug #47780)

- An assertion could fail if the optimizer used a `SPATIAL` index. (Bug #48258, Bug #47019)

- A combination of `GROUP BY WITH ROLLUP`, `DISTINCT` and the `const` [696] join type in a query caused a server crash when the optimizer used a temporary table to resolve `DISTINCT`. (Bug #48131)

- In some cases, using a null microsecond part in a `WHERE` condition (for example, `WHERE date_time_field <= 'YYYY-MM-DD HH:MM:SS.0000'`) could lead to incorrect results due to improper `DATETIME` comparison. (Bug #47963)

- `SUM()` [1047] artificially increased the precision of a `DECIMAL` argument, which was truncated when a temporary table was created to hold the results. (Bug #48370)

  References: See also Bug #45261.

- If an outer query was invalid, a subquery might not be set up. `EXPLAIN EXTENDED` did not expect this and caused a crash by trying to dereference improperly set up information. (Bug #48295)

- When a query used a `DATE` or `DATETIME` value formatted using any separator characters other than hyphen (`'-'`) and a `>=` condition matching only the greatest value in an indexed column, the result was empty if an index range scan was employed. (Bug #47925)

- `InnoDB` now ignores negative values supplied by a user for an `AUTO_INCREMENT` column when calculating the next value to store in the data dictionary. Setting `AUTO_INCREMENT` columns to negative values is undefined behavior and this change should bring the behavior of `InnoDB` closer to what users expect. (Bug #46965)

- In a replication scenario with `innodb_locks_unsafe_for_binlog` [1372] enabled on the slave, where rows were changed only on the slave (not through replication), in some rare cases, many messages of the following form were written to the slave error log: `InnoDB: Error: unlock row could not find a 4 mode lock on the record`. (Bug #41756)

Changes in MySQL 5.1.40 (2009-10-06)

InnoDB Plugin Notes

- In this release, the `InnoDB Plugin` is included in source and binary distributions, except RHEL3, RHEL4, SuSE 9 (x86, x86_64, ia64), and generic Linux RPM packages. It also does not work for FreeBSD 6 and HP-UX or for Linux on S/390, PowerPC, and generic ia64.

Bugs Fixed

- **Incompatible Change**: **Replication**: Concurrent transactions that inserted rows into a table with an `AUTO_INCREMENT` column could break statement-based or mixed-format replication error 1062 `Duplicate entry '...' for key 'PRIMARY'` on the slave. This was especially likely to happen when one of the transactions activated a trigger that inserted rows into the table with the `AUTO_INCREMENT` column, although other conditions could also cause the issue to manifest.

  As part of the fix for this issue, any statement that causes a trigger or function to update an `AUTO_INCREMENT` column is now considered unsafe for statement-based replication. For more information, see Replication and `AUTO_INCREMENT`. (Bug #45677)

  References: See also Bug #42415, Bug #48608, Bug #50440, Bug #53079.

- **Incompatible Change**: In binary installations of MySQL, the supplied `binary-configure` script would start and configure MySQL, even when command help was requested with the `--help` command-line option. The `--help` option, if provided, no longer starts and installs the server. (Bug #30954)

- **Partitioning**: When performing an `INSERT ... SELECT` into a partitioned table, `read_buffer_size` [516] bytes of memory were allocated for every partition in the target table, resulting in consumption of large amounts of memory when the table had many partitions (more than 100).

  This fix changes the method used to estimate the buffer size required for each partition and limits the total buffer size to a maximum of approximately 10 times `read_buffer_size` [516]. (Bug #45840)

- **Partitioning**: When reorganizing partitions, not all affected subpartitions were removed prior to renaming. One way in which the issue was visible was that attempting to reorganize two partitions into a single partition having the same name as one of the original partitions could lead to a crash of the server. (Bug #47029)

  References: See also Bug #45961, Bug #43729.

- **Partitioning**: An online or fast `ALTER TABLE` of a partitioned table could leave behind temporary files in the database directory.

  This issue was observed in MySQL 5.1.31 and later only. (Bug #46483)

- **Partitioning**: Inserting negative values into an `AUTO_INCREMENT` column of a partitioned table could lead to apparently unrelated errors or a crash of the server. (Bug #45823)

- **Partitioning**: Unnecessary calls were made in the server code for performing bulk inserts on partitions for which no inserts needed to be made. (Bug #35845)

  References: See also Bug #35843.

- **Replication**: When using row-based replication, `DROP TEMPORARY TABLE IF EXISTS` was written to the binary log if the table named in the statement did not exist, even though a `DROP TEMPORARY TABLE` statement should never be logged in row-based logging mode, whether the table exists or not. (Bug #46572)

- **Replication**: Performing `ALTER TABLE ... DISABLE KEYS` on a slave table caused row-based replication to fail. (Bug #47312)

- **Replication**: `BEGIN` statements were not included in the output of `mysqlbinlog`. (Bug #46998)

- **Replication**: When using row-based replication, importing a dump made with `mysqldump` and replicating a row with an `AUTO_INCREMENT` column set to 0, with `NO_AUTO_VALUE_ON_ZERO` [573] active on the master, the row was inserted successfully on the master; however any setting for `NO_AUTO_VALUE_ON_ZERO` [573] was ignored on the slave. When the `AUTO_INCREMENT` column

was incremented, this caused replication to fail on the slave due to a duplicate key error. In some cases it could also cause the slave to crash. (Bug #45999)

- **Replication**: By default, all statements executed by the `mysql_upgrade` program on the master are written to the binary log, then replicated to the slave. In some cases, this can result in problems; for example, it attempted to alter log tables on replicated databases (this failed due to logging being enabled).

  As part of this fix, a `mysql_upgrade` option, `--write-binlog`, is added. Its inverse, `--skip-write-binlog`, can be used to disable binary logging while the upgrade is in progress. (Bug #43579)

- **Replication**: On the master, if a binary log event is larger than `max_allowed_packet` [493], the error message `ER_MASTER_FATAL_ERROR_READING_BINLOG` [3971] is sent to a slave when it requests a dump from the master, thus leading the I/O thread to stop. On a slave, the I/O thread stops when receiving a packet larger than `max_allowed_packet` [493].

  In both cases, however, there was no `Last_IO_Error` reported, which made it difficult to determine why the slave had stopped in such cases. Now, `Last_IO_Error` is reported when `max_allowed_packet` [493] is exceeded, and provides the reason for which the slave I/O thread stopped. (Bug #42914)

  References: See also Bug #14068, Bug #47200, Bug #47303.

- **API**: The fix for Bug #24507 could lead in some cases to client application failures due to a race condition. Now the server waits for the “dummy” thread to return before exiting, thus making sure that only one thread can initialize the POSIX threads library. (Bug #42850)

- When re-installing MySQL on Windows on a server that has a data directory from a previous MySQL installation, the installer would fail to identify the existence of the installation and the password configured for the `root` user. (Bug #45200)

- When creating a new instance on Windows using `mysqld-nt` and the `--install` parameter, the value of the service would be set incorrectly, resulting in a failure to start the configured service. (Bug #46917)

- The `ARCHIVE` storage engine lost records during a bulk insert. (Bug #46961)

- The server ignored the setting of `sync_frm` [528] for `CREATE TABLE ... LIKE`. (Bug #46591)

- Assertion failure could result from repeated execution of a stored procedure containing an incorrect query with a subselect. (Bug #46629)

- `CONCAT_WS()` [951] could return incorrect results due to an argument buffer also being used as a result buffer. (Bug #46815)

- Certain `SELECT` statements containing `DISTINCT`, `GROUP BY`, and `HAVING` clauses could hang in an infinite loop. (Bug #46159)

- `CREATE TEMPORARY TABLE` failed for `InnoDB` tables on systems with case-insensitive file systems when `lower_case_table_names` [492] `= 2` and the pathname of the temporary file directory contained uppercase characters. (Bug #45638)

- For `InnoDB` tables, an unnecessary table rebuild for `ALTER TABLE` could sometimes occur for metadata-only changes. (Bug #46760)

- A parser problem prevented properly stripping backquotes from an argument to a user-defined function (UDF). If the UDF was in an `ORDER BY` clause, its name would not be properly resolved against an alias with the same name in the select list. (Bug #46259)

- The server crashed when re-using outer column references in correlated subqueries when the enclosing query used a temp table. (Bug #46791)

- An attempt to create a table with the same name as an existing view could cause a server crash. (Bug #46384)
- Client flags were incorrectly initialized for the embedded server, causing several tests in the `jp` test suite to fail. (Bug #45159)
- Failed multiple-table `DELETE` statements could raise an assertion. (Bug #46958)
- The `socket` [523] system variable was unavailable on Windows. (Bug #45498)
- `EXPLAIN` caused a server crash for certain valid queries. (Bug #47106)
- The `configure` option `--without-server` did not work. (Bug #46980)
- Solaris binary packages now are compiled with `-g0` rather than `-g`. (Bug #47137)
- The `pthread_cond_wait()` implementations for Windows could deadlock in some rare circumstances. (Bug #47768)
- Appending values to an `ENUM` or `SET` definition is a metadata change for which `ALTER TABLE` need not rebuild the table, but it was being rebuilt anyway. (Bug #45567)
- Debug builds could not be compiled with the Sun Studio compiler. (Bug #47474)
- On Mac OS X or Windows, sending a `SIGHUP` signal to the server or an asynchronous flush (triggered by `flush_time` [475]) caused the server to crash. (Bug #47525)
- A multiple-table `UPDATE` involving a natural join and a mergeable view raised an assertion. (Bug #47150)
- `InnoDB` did not disallow creation of an index with the name `GEN_CLUST_INDEX`, which is used internally. (Bug #46000)
- Dropping an `InnoDB` table that used an unknown collation (created on a different server, for example) caused a server crash. (Bug #46256)
- The `mysql-stress-test.pl` test script was missing from the `noinstall` packages on Windows. (Bug #41546)
- A test for stack growth failed on some platforms, leading to server crashes. (Bug #42213)
- Attempts to enable `large_pages` [486] with a shared memory segment larger than 4GB caused a server crash. (Bug #43606)
- Selecting from the process list in the embedded server caused a crash. (Bug #43733)

  References: See also Bug #47304.
- `LOAD DATA INFILE` statements were written to the binary log in such a way that parsing problems could occur when re-executing the statement from the log. (Bug #43746)
- `SELECT ... WHERE ... IN (NULL, ...)` was executed using a full table scan, even if the same query without the `NULL` used an efficient range scan. (Bug #44139)

  References: See also Bug #18360.
- `InnoDB` did not always disallow creating tables containing columns with names that match the names of internal columns, such as `DB_ROW_ID`, `DB_TRX_ID`, `DB_ROLL_PTR`, and `DB_MIX_ID`. (Bug #44369)
- The server used the wrong lock type (always `TL_READ` instead of `TL_READ_NO_INSERT` when appropriate) for tables used in subqueries of `UPDATE` statements. This led in some cases to

replication failure because statements were written in the wrong order to the binary log. (Bug #42108)

- `InnoDB` use of `SELECT MAX(autoinc_column)` could cause a crash when MySQL data dictionaries went out of sync. (Bug #44030)
- When using the `ARCHIVE` storage engine, `SHOW TABLE STATUS` displayed incorrect information for `Max_data_length`, `Data_length` and `Avg_row_length`. (Bug #29203)
- Concurrent execution of `FLUSH TABLES` along with `SHOW FUNCTION STATUS` or `SHOW PROCEDURE STATUS` could cause a server crash. (Bug #34895)
- Different invocations of `CHECKSUM TABLE` could return different results for a table containing columns with spatial data types. (Bug #35570)
- `myisamchk` performed parameter value casting at startup that generated unnecessary warning messages. (Bug #33785)
- Privileges for `SHOW CREATE VIEW` were not being checked correctly. (Bug #35996)
- When building MySQL on Windows from source, the `WITH_BERKELEY_STORAGE_ENGINE` option would fail to configure `BDB` support correctly. (Bug #27693)

Changes in MySQL 5.1.39 (2009-09-04)

Bugs Fixed

- **Performance**: For `MyISAM` tables with `bulk_insert_buffer_size` [463] values larger than 256KB, the performance of bulk insert operations such as multiple-row `INSERT` and `INSERT ... SELECT` operations has been improved greatly when up to a hundred rows are inserted at the same time. (Bug #44723)
- **Partitioning**: Partition pruning did not always work correctly when the table's partitioning key used the `TO_DAYS()` [994] function. (Bug #46362)
- **Partitioning**: An `INSERT ... SELECT` statement on an empty partition of a partitioned table failed with `ERROR 1030 (HY000): Got error 124 from storage engine`. This issue also caused queries run against a partitioned table while a `LOAD DATA CONCURRENT INFILE` statement was in progress to fail with the same error. (Bug #46639)

  References: See also Bug #35845, Bug #44657, Bug #45840.
- **Partitioning**: A partitioned table having a `TIMESTAMP` column with a default value of `CURRENT_TIMESTAMP` and this column was not defined using an `ON UPDATE` option, an `ALTER TABLE ... REORGANIZE PARTITION` statement on the table caused the `TIMESTAMP` column value to be set to `CURRENT_TIMESTAMP` regardless. (Bug #46478)
- **Partitioning**: Attempting to access a partitioned table when partitioning support was disabled in a MySQL server binary that had been compiled with partitioning support caused the server to crash. (Bug #39893)
- **Partitioning**: The use of `TO_DAYS()` [994] in the partitioning expression led to selection failures when the column having the date value contained invalid dates. This occurred because the function returns `NULL` in such cases, and the partition containing NULL values was pruned away. For example, this problem occurred if `'2001-02-00'` was inserted into a `DATE` column of such a table, and a subsequent query on this table used `WHERE date_col < '2001-02-00'`—while `'2001-01-01'` is less than `'2001-02-00'`, `TO_DAYS('2001-02-00')` evaluates as `NULL`, and so the row containing `'2001-01-01'` was not returned. Now, for tables using `RANGE` or `LIST` partitioning and having `TO_DAYS()` [994] in the partitioning expression, the `NULL` partition is also scanned instead of being ignored.

  The fix for this issue also corrects misbehavior such that a query of the form `SELECT * FROM table WHERE date_col < date_val` on a table partitioned by `RANGE` or `LIST` was handled as

though the server SQL mode included `ALLOW_INVALID_DATES` [572] even if this was not actually part of the server SQL mode at the time the query was issued. (Bug #20577)

References: See also Bug #18198, Bug #32021, Bug #46362.

- **Replication**: The binary logging behavior (and thus, the replication behavior) of `CREATE DATABASE IF NOT EXISTS`, `CREATE TABLE IF NOT EXISTS`, and `CREATE EVENT IF NOT EXISTS` was not consistent among these statements, nor with that of `DROP DATABASE IF EXISTS`, `DROP TABLE IF EXISTS`, and `DROP EVENT IF EXISTS`: A `DROP ... IF EXISTS` statement is always logged even if the database object named in the statement does not exist. However, of the `CREATE ... IF NOT EXISTS` statements, only the `CREATE EVENT IF NOT EXISTS` statement was logged when the database object named in the statement already existed.

  Now, every `CREATE ... IF NOT EXISTS` statement is written to the binary log (and thus replicated), whether the database object named in the statement exists or not. For more information, see Replication of `CREATE ... IF NOT EXISTS` Statements.

  Exception. Replication and logging of `CREATE TABLE IF NOT EXISTS ... SELECT` continues to be handled according to existing rules. See Replication of `CREATE TABLE ... SELECT` Statements, for more information.

  (Bug #45574)

- **Replication**: Performing a multi-row update of the `AUTO_INCREMENT` column of a transactional table could result in an inconsistency between master and slave when there was a trigger on the transactional table that updated a nontransactional table. When such an update failed on the master, no rows were updated on the master, but some rows could (erroneously) be updated on the slave. (Bug #46864)

- **Replication**: When a statement that changed both transactional and nontransactional tables failed, the transactional changes were automatically rolled back on the master but the slave ignored the error and did not roll them back, thus leading to inconsistencies between master and slave.

  This issue is fixed by automatically rolling back a statement that fails on the slave; however, the transaction is not rolled back unless a corresponding `ROLLBACK` statement is found in the relay log file. (Bug #46130)

  References: See also Bug #33864.

- **Replication**: When `slave_transaction_retries` [1645] is set, a statement that replicates, but is then rolled back due to a deadlock on the slave, should be retried. However, in certain cases, replication was stopped with error 1213 (`Deadlock found when trying to get lock; try restarting transaction`) instead, even when this variable was set. (Bug #45694)

- **Replication**: When using statement-based replication, database-level character sets were not always honored by the replication SQL thread. This could cause data inserted on the master using `LOAD DATA` to be replicated using the wrong character set.

  Note

  This was not an issue when using row-based replication.

  (Bug #45516)

- **Replication**: When using the `--replicate-rewrite-db` [1637] option and the database referenced by this option on the master was the current database when the connection to the slave was closed, any temporary tables existing in this database were not properly dropped. (Bug #46861)

- **Replication**: In some cases, a `STOP SLAVE` statement could cause the replication slave to crash. This issue was specific to MySQL on Windows or Macintosh platforms. (Bug #45238, Bug #45242, Bug #45243, Bug #46013, Bug #46014, Bug #46030)

References: See also Bug #40796.

- **Replication**: Creating a scheduled event whose `DEFINER` clause was either set to `CURRENT_USER` [1033] or not set explicitly caused the master and the slave to become inconsistent. This issue stems from the fact that, in both cases, the `DEFINER` is set to the `CURRENT_USER` [1033] of the current thread. (On the master, the `CURRENT_USER` [1033] is the `mysqld` user; on the slave, the `CURRENT_USER` [1033] is empty.)

  This behavior has been modified as follows:

  - If `CURRENT_USER` [1033] is used as the `DEFINER`, it is replaced with the *value* of `CURRENT_USER` [1033] before the `CREATE EVENT` statement is written to the binary log.
  - If the definer is not set explicitly, a `DEFINER` clause using the value of `CURRENT_USER` [1033] is added to the `CREATE EVENT` statement before it is written to the binary log.

  (Bug #44331)

  References: See also Bug #42217.

- **Replication**: When using the statement-based logging format, the only possible safe combination of transactional and nontransactional statements within the same transaction is to perform any updates on nontransactional tables (such as `MyISAM` tables) first, before updating any transactional tables (such as those using the `InnoDB` storage engine). This is due to the fact that, although a modification made to a nontransactional table is immediately visible to other connections, the update is not immediately written to the binary log, which can lead to inconsistencies between master and slave. (Other combinations may hide a causal dependency, thus making it impossible to write statements updating nontransactional tables to the binary log in the correct order.)

  However, in some cases, this situation was not handled properly, and the determination whether a given statement was safe or not under these conditions was not always correct. In particular, a multi-table update that affected both transactional and nontransactional tables or a statement modifying data in a nontransactional table having a trigger that operated on a transactional table (or the reverse) was not determined to be unsafe when it should have been.

  With this fix, the following determinations regarding replication safety are made when combining updates to transactional and nontransactional tables within the same transaction in statement-based logging mode:

  1. Any statement modifying data in a nontransactional table within a given transaction is considered safe if it is issued prior to any data modification statement accessing a transactional table within the same transaction.
  2. A statement that updates transactional tables only is always considered safe.
  3. A statement affecting both transactional and nontransactional tables within a transaction is always considered unsafe. It is not necessary that both tables be modified for this to be true; for example, a statement such as `INSERT INTO innodb_table SELECT * FROM myisam_table` is also considered unsafe.

  Note

  The current fix is valid only when using statement-based logging mode; we plan to address similar issues occurring when using the `MIXED` or `ROW` format in a future MySQL release.

  (Bug #28976)

- Truncation of `DECIMAL` values could lead to assertion failures; for example, when deducing the type of a table column from a literal `DECIMAL` value. (Bug #45261)

References: See also Bug #48370.

- In queries for which the loose index scan access method was chosen, using a condition of the form `col_name` rather than the equivalent `col_name <> 0` caused an assertion failure. (Bug #46607)
- Stack overflow checking did not account for the size of the structure stored in the heap. (Bug #46807)
- Killing a query that was performing a sort could result in a memory leak. (Bug #45962)
- `SHOW CREATE TRIGGER` for a `MERGE` table trigger caused an assertion failure. (Bug #46614)
- A query containing a subquery in the `FROM` clause and `PROCEDURE ANALYSE()` caused a server crash. (Bug #46184)

  References: See also Bug #48293.
- `TRUNCATE TABLE` for a table that was opened with `HANDLER` did not close the handler and left it in an inconsistent state that could lead to a server crash. Now `TRUNCATE TABLE` for a table closes all open handlers for the table. (Bug #46456)
- The server could crash for queries with the following elements: 1. An “impossible where” in the outermost `SELECT`; 2. An aggregate in the outermost `SELECT`; 3. A correlated subquery with a `WHERE` clause that includes an outer field reference as a top-level `WHERE` sargable predicate; (Bug #46749)
- `CREATE TABLE ... SELECT` could cause assertion failure if a table already existed with the same name and contained an `AUTO_INCREMENT` column. (Bug #46616)
- A buffer overflow could occur during handling of `IS NULL` ranges. (Bug #37044)
- `mysqladmin --wait ping` crashed on Windows systems. (Bug #35132)
- Installation of MySQL on Windows would fail to set the correct location for the character set files, which could lead to `mysqld` and `mysql` failing to initialize properly. (Bug #17270)

Changes in MySQL 5.1.38 (2009-09-01)

InnoDB Plugin Notes

- As of MySQL 5.1.38, the `InnoDB Plugin` is included in MySQL 5.1 releases, in addition to the built-in version of `InnoDB` that has been included in previous releases. The version of the `InnoDB Plugin` in this release is 1.0.4 and is considered of Beta quality.

  The `InnoDB Plugin` offers new features, improved performance and scalability, enhanced reliability and new capabilities for flexibility and ease of use. Among the features of the `InnoDB Plugin` are “Fast index creation,” table and index compression, file format management, new `INFORMATION_SCHEMA` tables, capacity tuning, multiple background I/O threads, and group commit.

  For information about these features, see InnoDB Plugin 1.0 for MySQL 5.1 User’s Guide. For general information about using `InnoDB` in MySQL, see The `InnoDB` Storage Engine.

  The `InnoDB Plugin` is included in source and binary distributions, except RHEL3, RHEL4, SuSE 9 (x86, x86_64, ia64), and generic Linux RPM packages.

  For instructions on replacing the built-in version of `InnoDB` with `InnoDB Plugin`, see Using `InnoDB Plugin` Instead of the Built-In `InnoDB`.

Functionality Added or Changed

- **Replication**: With statement-based logging (SBL), repeatedly calling statements that are unsafe for SBL caused a warning message to be written to the error log for each statement, and there was no

way to disable this behavior. Now the server logs messages about statements that are unsafe for statement-based logging only if the `log_warnings` variable is greater than 0. (Bug #46265)

- The undocumented `TRANSACTIONAL` and `PAGE_CHECKSUM` keywords were removed from the grammar. (Bug #45829)
- Previously, `SELECT ... INTO OUTFILE` dumped column values without character set conversion, which could produce data files that cannot be imported without error if different columns used different character sets. A consequence of this is that `mysqldump` ignored the `--default-character-set` [295] option if the `--tab` [301] option was given (which causes `SELECT ... INTO OUTFILE` to be used to dump data.)

  `INTO OUTFILE` now can be followed by a `CHARACTER SET` clause indicating the character set to which dumped values should be converted. Also, `mysqldump` adds a `CHARACTER SET` clause to the `SELECT ... INTO OUTFILE` statement used to dump data, so that `--default-character-set` [295] is no longer ignored if `--tab` [301] is given.

  Other changes are that `SELECT ... INTO OUTFILE` enforces that `ENCLOSED BY` and `ESCAPED BY` arguments must be a single character, and `SELECT ... INTO OUTFILE` and `LOAD DATA INFILE` produce warnings if non-ASCII field or line separators are specified. (Bug #30946)
- Previously, `mysqldump` would not dump the `INFORMATION_SCHEMA` database and ignored it if it was named on the command line. Now, `mysqldump` will dump `INFORMATION_SCHEMA` if it is named on the command line. Currently, this requires that the `--skip-lock-tables` [297] (or `--skip-opt` [301]) option be given. (Bug #33762)
- The MySQL `euckr` character set now can store extended codes [81...FE][41..5A,61..7A,81..FE], which makes `euckr` compatible with the Microsoft `cp949` character set.
- Pluggable storage engines now can be built for Windows.

Bugs Fixed

- **Performance**: The table cache lock (`LOCK_open`) is now an adaptive mutex, which should improve performance in workloads where this lock is heavily contended. (Bug #43435)
- **Partitioning**: When using a debug build of MySQL, if a query against a partitioned table having an index on one or more `DOUBLE` columns used that index, the server failed with an assertion. (Bug #45816)
- **Partitioning**: Attempting to create a table using an invalid or inconsistent subpartition definition caused the server to crash. An example of such a statement is shown here:

```
CREATE TABLE t2 (s1 INT, s2 INT)
PARTITION BY LIST (s1) SUBPARTITION BY HASH (s2) SUBPARTITIONS 1
(
    PARTITION p1 VALUES IN (1),
    PARTITION p2 VALUES IN (2) (SUBPARTITION p3)
);
```

  (Bug #46354)
- **Partitioning**: A failed `RENAME TABLE` operation on a table with user-defined partitioning left the table in an unusable state, due to only some of the table files having been renamed. (Bug #30102)
- **Replication**: When a statement that changes a nontransactional table failed, the transactional cache was flushed, causing a mismatch between the execution and logging histories. Now we avoid flushing the transactional cache unless a `COMMIT` or `ROLLBACK` is issued. (Bug #46129)

  References: This bug is a regression of Bug #43929, Bug #11752675.
- **Replication**: The internal function `get_master_version_and_clock()` (defined in `sql/slave.cc`) ignored errors and passed directly when queries failed, or when queries succeeded but the result retrieved was empty. Now this function tries to reconnect the master if a query fails due to

transient network problems, and to fail otherwise. The I/O thread now prints a warning if the same system variables do not exist on master (in the event the master is a very old version of MySQL, compared to the slave.) (Bug #45214)

- **Replication**: When using the `MIXED` logging format, after creating a temporary table and performing an update that switched the logging format to `ROW`, the format switch persisted following the update. This prevented any subsequent DDL statements on temporary tables from being written to the binary log until the temporary table was dropped. (Bug #43046)

  References: See also Bug #40013. This bug was introduced by Bug #20499.

- **Replication**: If the `--log-bin-trust-function-creators` [1648] option is not enabled, `CREATE FUNCTION` requires one of the modifiers `DETERMINISTIC`, `NO SQL`, or `READS SQL DATA`. When using statement-based mode, the execution of a stored function should follow the same rules; however, only functions defined with `DETERMINISTIC` could actually be executed. In addition, the wrong error was generated (`ER_BINLOG_ROW_RBR_TO_SBR` [3991] instead of `ER_BINLOG_UNSAFE_ROUTINE` [3983]).

  Now execution of stored functions is compatible with creation in this regard; when a stored function without one of the modifiers above is executed in `STATEMENT` mode, the correct error is raised, and functions defined using `NO SQL`, `READS SQL DATA`, or both (that is, without using `DETERMINISTIC`) can be executed. (Bug #41166)

- An infinite hang and 100% CPU usage occurred after a handler tried to open a merge table.

  If the command `mysqladmin shutdown` was executed during the hang, the debug server generated the following assert:

  ```
  mysqld: table.cc:407: void free_table_share(TABLE_SHARE*): Assertion `share->ref_count ==
  0' failed.
  090610 14:54:04 - mysqld got signal 6 ;
  ```

  (Bug #45781)

- The MySQL Server crashed when performing a `REPLACE` into a `MERGE` table if there was a duplicate. (Bug #45800)

- A Windows Installation using the GUI installer would fail with:

  ```
  MySQL Server 5.1 Setup Wizard ended prematurely

  The wizard was interrupted before MySQL Server 5.1. could be completely installed.

  Your system has not been modified. To complete installation at another time, please run
  setup again.

  Click Finish to exit the wizard
  ```

  This was due to a step in the MSI installer that could fail to execute correctly on some environments. (Bug #45418)

- Several Valgrind warnings were corrected. (Bug #46003, Bug #46034, Bug #46042)

- An optimization that moved an item from a subquery to an outer query could cause a server crash. (Bug #46051)

- After an error such as a table-full condition, `INSERT IGNORE` could cause an assertion failure for debug builds. (Bug #46075)

- For problems reading SSL files during SSL initialization, the server wrote error messages to `stderr` rather than to the error log. (Bug #45770)

- The vendor name change from MySQL AB to Sun Microsystems, Inc. in RPM packages was not handled gracefully when upgrading MySQL using an RPM package. (Bug #45534)

- Incorrect index optimization could lead to incorrect results or server crashes. (Bug #46454)
- The server printed warnings at startup about adjusting the value of the `max_join_size` [496] system variable. (These were harmless, but might be seen by users as significant.) (Bug #46385)
- The test suite was missing from RPM packages. (Bug #46834)
- `CREATE TABLE ... SELECT` could cause a server crash if no default database was selected. (Bug #45998)
- `mysql` did not handle backspace properly for multi-byte characters. This has been fixed now if `mysql` is linked with the `readline` library. It is not fixed if `mysql` is linked with `libedit`, which does not contain the necessary support for multi-byte character sets. (Bug #46310)
- Creating a new instance after previously removing an instance would fail to complete the installation properly because the security settings could not be applied correctly. (Bug #44428)
- During installation on Windows, the MySQL Instance Configuration Wizard window could be opened at a size too small to be usable. (Bug #38723)
- The output of `mysqldump --tab` for views included a `DROP TABLE` statement without the `IF EXISTS` qualifier. (Bug #37377)
- The server crashed when executing a prepared statement containing a duplicated `MATCH()` function call in the select list and `ORDER BY` clause; for example, `SELECT MATCH(a) AGAINST('test') FROM t1 ORDER BY MATCH(a) AGAINST('test')`. (Bug #37740)
- `SHOW PROCESSLIST` could access freed memory of a stored procedure run in a concurrent session. (Bug #38816)
- When using quick access methods to search for rows in `UPDATE` and `DELETE` statements, there was no check whether a fatal error had already been sent to the client while evaluating the quick condition. Consequently, a false OK (following the error) was sent to the client, causing the error to be incorrectly transformed into a warning. (Bug #40113)
- Enabling the event scheduler from within the file specified by `--init-file` [429] caused a server crash. (Bug #43587)
- Partitioning a log table caused a server crash. (Bug #40281)
- `mysqladmin` did not have enough space allocated for tracking all variables when using `--vertical` [282] or `--relative` [281] with `extended-status`. (Bug #40395)
- `mysqlslap` ignored the `--csv` [317] option if it was given without an argument. (Bug #44412)
- `mysqladmin --count=X --sleep=Y` incorrectly delayed *`Y`* seconds after the last iteration before exiting. (Bug #42639)
- Invalid memory reads could occur using the compressed client/server protocol. (Bug #45031)
- The server did not always check the return value of calls to the `hash_init()` function. (Bug #43572)
- For debug builds, executing a stored procedure as a prepared statement could sometimes cause an assertion failure. (Bug #44521)
- The `mysql_real_connect()` C API function only attempted to connect to the first IP address returned for a hostname. This could be a problem if a hostname mapped to multiple IP address and the server was not bound to the first one returned. Now `mysql_real_connect()` attempts to connect to all IPv4 or IPv6 addresses that a domain name maps to. (Bug #45017)

  References: See also Bug #47757.

- A test for stack growth failed on some platforms, leading to server crashes. (Bug #42213)
- `make_binary_distribution` did not always generate correct distribution names. (Bug #37808)
- Some files in an AIX `tar` file distribution unpacked with incorrect permissions. (Bug #44647)
- Invalid input could cause invalid memory reads by the parser. (Bug #45010)
- Using `mysql_stmt_execute()` to call a stored procedure could cause a server crash. (Bug #44495)
- When performing an installation on Windows using the GUI installer, the installer would fail to wait long enough during installation for the MySQL service to be installed, which would cause the installation to fail and may cause security settings, such as the `root` password to not be applied correctly. (Bug #30525)
- `mysql` included extra spaces at the end of some result set lines. (Bug #29622)
- If the MySQL server was killed without the PID file being removed, attempts to stop the server with `mysql.server stop` waited 900 seconds before giving up. (Bug #31785)
- `mysqlcheck` failed to fix table names when the `--fix-table-names` [287] and `--all-in-1` [285] options were both specified. (Bug #31821)
- `mysqlimport` was not always compiled correctly to enable thread support, which is required for the `--use-threads` [309] option. (Bug #32991)
- `mysql_upgrade` silently ignored the `--basedir` [256] and `--datadir` [256] options, which it accepts for backward compatibility. Now it prints a warning. (Bug #36558)
- When installing the Windows service, using quotation marks around command-line configuration parameters could cause the quotation marks to be incorrectly placed around the entire command-line option, and not just the value. (Bug #27535)
- If the `mysql` client was built with the `readline` library and the `.inputrc` file mapped `Space` to the `magic-space` function, it became impossible to enter spaces. (Bug #27439)
- `mysqlimport` did not correctly quote and escape table identifiers and file names. (Bug #28071)
- The `mysql` client inconsistently handled NUL bytes in column data in various output formats. (Bug #28203)
- If `InnoDB` reached its limit on the number of concurrent transactions (1023), it wrote a descriptive message to the error log but returned a misleading error message to the client, or an assertion failure occurred. (Bug #18828)

  References: See also Bug #46672.

Changes in MySQL Enterprise 5.1.37sp1 [QSP] (2009-10-10)

This is a *Service Pack* release of the MySQL Enterprise Server 5.1.

Bugs Fixed

- A Windows Installation using the GUI installer would fail with:

```
MySQL Server 5.1 Setup Wizard ended prematurely

The wizard was interrupted before MySQL Server 5.1. could be completely installed.

Your system has not been modified. To complete installation at another time, please run
setup again.

Click Finish to exit the wizard
```

This was due to a step in the MSI installer that could fail to execute correctly on some environments. (Bug #45418)

- Incorrect index optimization could lead to incorrect results or server crashes. (Bug #46454)
- The test suite was missing from RPM packages. (Bug #46834)
- `CREATE TABLE ... SELECT` could cause a server crash if no default database was selected. (Bug #45998)
- `SHOW CREATE TRIGGER` for a `MERGE` table trigger caused an assertion failure. (Bug #46614)
- A query containing a subquery in the `FROM` clause and `PROCEDURE ANALYSE()` caused a server crash. (Bug #46184)

  References: See also Bug #48293.
- The server could crash for queries with the following elements: 1. An “impossible where” in the outermost `SELECT`; 2. An aggregate in the outermost `SELECT`; 3. A correlated subquery with a `WHERE` clause that includes an outer field reference as a top-level `WHERE` sargable predicate; (Bug #46749)
- For debug builds, executing a stored procedure as a prepared statement could sometimes cause an assertion failure. (Bug #44521)
- Using `mysql_stmt_execute()` to call a stored procedure could cause a server crash. (Bug #44495)

Changes in MySQL 5.1.37 (2009-07-13)

Functionality Added or Changed

- **Important Change**: **Replication**: `RESET MASTER` and `RESET SLAVE` now reset the values shown for `Last_IO_Error`, `Last_IO_Errno`, `Last_SQL_Error`, and `Last_SQL_Errno` in the output of `SHOW SLAVE STATUS`. (Bug #44270)

  References: See also Bug #34654.

Bugs Fixed

- **Partitioning**: **Security Fix**: Accessing a table having user-defined partitioning when the server SQL mode included `ONLY_FULL_GROUP_BY` [575] caused the MySQL server to crash. For example, the following sequence of statements crashed the server:

```
DROP TABLE IF EXISTS t1;

SET SESSION sql_mode='ONLY_FULL_GROUP_BY';

CREATE TABLE t1 (id INT, KEY(id))
    PARTITION BY HASH(id) PARTITIONS 2;
```

  (Bug #45807)
- **Security Fix**: The `strxnmov()` library function could write a null byte after the end of the destination buffer. (Bug #44834)
- **Performance**: With `InnoDB` tables, MySQL used a less-selective secondary index to avoid a filesort even if a prefix of the primary key was much more selective.

  The fix for this problem might cause other queries to run more slowly. (Bug #45828)
- **Important Change**: **Replication**: When using `STATEMENT` or `MIXED` binary logging format, a statement that changes both nontransactional and transactional tables must be written to the binary log whenever there are changes to nontransactional tables. This means that the statement goes into

the binary log even when the changes to the transactional tables fail. In particular, in the event of a failure such statement is annotated with the error number and wrapped inside a pair of `BEGIN` and `ROLLBACK` statements.

On the slave, while applying the statement, it is expected that the same failure and the rollback prevent the transactional changes from persisting. However, statements that fail due to concurrency issues such as deadlocks and timeouts are logged in the same way, causing the slave to stop since the statements are applied sequentially by the SQL thread.

To address this issue, we ignore concurrency failures on the slave. Specifically, the following failures are now ignored: `ER_LOCK_WAIT_TIMEOUT` [3970], `ER_LOCK_DEADLOCK` [3970], and `ER_XA_RBDEADLOCK` [3996]. (Bug #44581)

- **Partitioning**: Truncating a partitioned `MyISAM` table did not reset the `AUTO_INCREMENT` value. (Bug #35111)
- **Replication**: The `SHOW SLAVE STATUS` connection thread competed with the slave SQL thread for use of the error message buffer. As a result, the connection thread sometimes received incomplete messages. This issue was uncovered with `valgrind` when message strings were passed without `NULL` terminators, causing the error `Conditional jump or move depends on uninitialized value(s)`. (Bug #45511)

  References: See also Bug #43076.
- **Replication**: For replication of a stored procedure that uses the `gbk` character set, the result on the master and slave differed. (Bug #45485)
- **Replication**: Statements using `LIMIT` generated spurious `Statement is not safe to log in statement format` warnings in the error log, causing the log to grow rapidly in size. (Bug #42851)

  References: See also Bug #46265, Bug #42415. This bug was introduced by Bug #34768.
- **Replication**: The internal function `purge_relay_logs()` did not propagate an error occurring in another internal function `count_relay_log_space()`. (Bug #44115)
- **Replication**: Large transactions and statements could corrupt the binary log if the size of the cache (as set by `max_binlog_cache_size` [1656]) was not large enough to store the changes.

  Now, for transactions that do not fit into the cache, the statement is not logged, and the statement generates an error instead.

  For nontransactional changes that do not fit into the cache, the statement is also not logged—an incident event is logged after committing or rolling back any pending transaction, and the statement then raises an error.

  Note

  If a failure occurs before the incident event is written the binary log, the slave does not stop, and the master does not report any errors.

  (Bug #43929, Bug #11752675)

  References: See also Bug #37148, Bug #11748696, Bug #46166, Bug #11754544.
- **Replication**: The `--database` [350] option for `mysqlbinlog` was ignored when using the row-based logging format. (Bug #42941)
- **Replication**: Shutting down the slave while executing `FLUSH LOGS`, `CHANGE MASTER TO`, or `STOP SLAVE` could sometimes cause it to crash. (Bug #38240)
- **Replication**: When reading a binary log that was in use by a master or that had not been properly closed (possibly due to a crash), the following message was printed: `Warning: this binlog`

`was not closed properly. Most probably mysqld crashed writing it`. This message did not take into account the possibility that the file was merely in use by the master, which caused some users concern who were not aware that this could happen.

To make this clear, the original message has been replaced with `Warning: this binlog is either is use or was not closed properly`. (Bug #34687)

- Invalid memory reads and writes were generated when altering merge and base tables. This could lead to a crash or Valgrind errors:

```
==28038== Invalid write of size 1
at: memset (mc_replace_strmem.c:479)
by: myrg_attach_children (myrg_open.c:433)
by: ha_myisammrg::attach_children() (ha_myisammrg.cc:546)
by: ha_myisammrg::extra(ha_extra_function) (ha_myisammrg.cc:944)
by: attach_merge_children(TABLE_LIST*) (sql_base.cc:4147)
by: open_tables(THD*, TABLE_LIST**, unsigned*, unsigned) (sql_base.cc:4709)
by: open_and_lock_tables_derived(THD*, TABLE_LIST*, bool) (sql_base.cc:4977)
by: open_n_lock_single_table (mysql_priv.h:1550)
by: mysql_alter_table(sql_table.cc:6428)
by: mysql_execute_command(THD*) (sql_parse.cc:2860)
by: mysql_parse(THD*, char const*, unsigned, char const**) (sql_parse.cc:5933)
by: dispatch_command (sql_parse.cc:1213)
```

(Bug #45796)

- Some collations were causing `IBMDB2I` to report inaccurate key range estimations to the optimizer for `LIKE` clauses that select substrings. This can be seen by running `EXPLAIN`. This problem primarily affects multi-byte and unicode character sets. (Bug #45803)
- When creating tables using the `IBMDB2I` storage engine with the `ibmdb2i_create_index_option` option set to 1, creating an `IBMDB2I` table with a primary key should produce an additional index that uses EBCDIC hexadecimal sorting, but this index was not created. (Bug #45983)
- Inserting data into a table using the `macce` character set with the `IBMDB2I` storage engine would fail. (Bug #45793)
- There was a race condition when changing `innodb_commit_concurrency` [1364] at runtime to the value `DEFAULT`. (Bug #45749)

  References: See also Bug #42101.
- The server crashed if evaluation of `GROUP_CONCAT(... ORDER BY)` [1046] required allocation of a sort buffer but allocation failed. (Bug #46080)
- The server crashed for attempts to use `REPLACE` or `INSERT ... ON DUPLICATE KEY UPDATE` with a view defined using a join. (Bug #45806)
- If `autocommit` was enabled, `InnoDB` did not roll back `DELETE` or `UPDATE` statements if the statement was killed. (Bug #45309)
- `InnoDB` recovery could hang due to redo logging of doublewrite buffer pages. (Bug #45097)
- Use of `DECIMAL` constants with more than 65 digits in `CREATE TABLE ... SELECT` statements led to spurious errors or assertion failures. (Bug #45262)
- The `mysql` client could misinterpret some character sequences as commands under some circumstances. (Bug #45236)
- Use of `CONVERT()` [1012] with an empty `SET` value could cause an assertion failure. (Bug #45168)
- An assertion failure could occur if `InnoDB` tried to unlock a record when the clustered index record was unknown. (Bug #45357)

- `--enable-plugin_name` options (for example, `--enable-innodb`) did not work correctly. (Bug #45336)

  References: See also Bug #19027.

- `SHOW CREATE TRIGGER` requires the `TRIGGER` [628] privilege but was not checking privileges. (Bug #45412)

- Performing an empty XA transaction caused the server to crash for the next XA transaction. (Bug #45548)

- The optimizer mishandled “impossible range” conditions and returned empty results due to an uninitialized variable. (Bug #45266)

- If an error occurred during the creation of a table (for example, the table already existed) having an `AUTO_INCREMENT` column and a `BEFORE` trigger that used the `INSERT ... SELECT` construct, an internal flag was not reset properly. This led to a crash the next time the table was opened again. (Bug #44653)

- For queries with a sufficient number of subqueries in the `FROM` clause of this form:

  ```
  SELECT * FROM (SELECT 1) AS t1,
                (SELECT 2) AS t2,
                (SELECT 3) AS t3, ...
  ```

  The query failed with a `Too high level of nesting for select` error, as though the query had this form:

  ```
  SELECT * FROM (SELECT 1 FROM (SELECT 2 FROM (SELECT 3 FROM ...
  ```

  (Bug #41156)

- When reading binary data, the concatenation function for geometry data collections did not rigorously check for available data, leading to invalid reads and server crashes. (Bug #44684)

- Valgrind warnings that occurred for `SHOW TABLE STATUS` with `InnoDB` tables were silenced. (Bug #38479)

- In the `mysql` client, if the server connection was lost during repeated `status` commands, the client would fail to detect this and command output would be inconsistent. (Bug #37274)

- `configure.in` contained references to literal instances of `nm` and `libc`, rather than to variables parameterized for the proper values on the current platform. (Bug #42721)

- `configure.in` did not properly check for the `pthread_setschedprio()` function. (Bug #42599)

- A workaround for a Sun Studio bug was instituted. (Bug #41710)

- A Valgrind error during subquery execution was corrected. (Bug #36995)

- Some `UPDATE` statements that affected no rows returned a rows-affected count of one. (Bug #40565)

- `SHOW ERRORS` returned an empty result set after an attempt to drop a nonexistent table. (Bug #42364)

- When invoked to start multiple server instances, `mysqld_multi` sometimes would fail to start them all due to not changing location into the base directory for each instance. (Bug #36654)

- Rows written to the slow query log could have an indeterminate `Rows_examined` value due to improper initialization. (Bug #34002)

- Renaming a column that appeared in a foreign key definition did not update the foreign key definition with the new column name. (Bug #21704)

Changes in MySQL 5.1.36 (2009-06-16)

Functionality Added or Changed

- **Important Change**: **Replication**: Previously, incident log events were represented as comments in the output from `mysqlbinlog`, making them effectively silent when playing back the binlog.

  (An incident log event represents an incident that could cause the contents of the database to change without that event being recorded in the binary log.)

  This meant that, if the SQL were applied to a server, it could potentially lead to the master and the slave having different data. To make it possible to handle incident log events without breaking applications that expect the previous behavior, the nonsense statement `RELOAD DATABASE` is added to the SQL output for that incident log event, which causes an error.

  To use this functionality currently requires hand editing of the dump file and handling of each case on an individual basis by a database administrator before applying the output to a server. (Bug #44442)

- The `mysqltest` program now has a `move_file *from_file to_file*` command for renaming files. This should be used in test cases rather than invoking an external command that might be platform specific. (Bug #39542)

- The time zone tables available at http://dev.mysql.com/downloads/timezones.html have been updated. These tables can be used on systems such as Windows or HP-UX that do not include zoneinfo files. (Bug #39923)

- `mysql_upgrade` now displays a message indicating the connection parameters it uses when invoking `mysqlcheck`. (Bug #44638)

- The maximum value for `max_binlog_cache_size` [1656] has been increased from $2^{32} - 1$ to $2^{64} - 1$ (even on 32-bit platforms), which enables transactions 4GB and larger to be performed when binary logging is enabled. (Bug #10206)

Bugs Fixed

- **Security Fix**: Four potential format string vulnerabilities were fixed (discovered by the Veracode code analysis). (Bug #44166)

- **Security Fix**: The server crashed if an account with the `CREATE ROUTINE` [626] privilege but not the `EXECUTE` [626] privilege attempted to create a stored procedure. (Bug #44798)

- **Security Fix**: The server crashed if an account without the proper privileges attempted to create a stored procedure. (Bug #44658)

- **Performance**: The `InnoDB` adaptive hash latch is released (if held) for several potentially long-running operations. This improves throughput for other queries if the current query is removing a temporary table, changing a temporary table from memory to disk, using `CREATE TABLE ... SELECT`, or performing a `MyISAM` repair on a table used within a transaction. (Bug #32149)

- **Incompatible Change**: The server can load plugins under the control of startup options. For example, many storage engines can be built in pluggable form and loaded when the server starts. In the following descriptions, *`plugin_name`* stands for a plugin name such as `innodb`.

  Previously, plugin options were handled like other boolean options (see Program Option Modifiers). That is, any of these options enabled the plugin:

```
--plugin_name
--plugin_name=1
--enable-plugin_name
```

  And these options disabled the plugin:

```
--plugin_name=0
--disable-plugin_name
```

```
--skip-plugin_name
```

However, use of a boolean option for plugin loading did not provide control over what to do if the plugin failed to start properly: Should the server exit, or start with the plugin disabled? The actual behavior has been that the server starts with the plugin disabled, which can be problematic. For example, if `InnoDB` fails to start, existing `InnoDB` tables become inaccessible, and attempts to create new `InnoDB` tables result in tables that use the default storage engine unless the `NO_ENGINE_SUBSTITUTION` [574] SQL mode has been enabled to cause an error to occur instead.

Now, there is a change in the options used to control plugin loading, such that they have a tristate format:

- `--plugin_name=OFF`

  Do not enable the plugin.

- `--plugin_name[=ON]`

  Enable the plugin. If plugin initialization fails, start the server anyway, but with the plugin disabled. Specifying the option as `--plugin_name` without a value also enables the plugin.

- `--plugin_name=FORCE`

  Enable the plugin. If plugin initialization fails, do not start the server. In other words, force the server to run with the plugin or not at all.

The values `OFF`, `ON`, and `FORCE` are not case sensitive.

Suppose that `CSV` and `InnoDB` have been built as pluggable storage engines and that you want the server to load them at startup, subject to these conditions: The server is permitted to run if `CSV` initialization fails, but must require that `InnoDB` initialization succeed. To accomplish that, use these lines in an option file:

```
[mysqld]
csv=ON
innodb=FORCE
```

This change is incompatible with the previous implementation if you used options of the form `--plugin_name=0` or `--plugin_name=1`, which should be changed to `--plugin_name=OFF` or `--plugin_name=ON`, respectively.

`--enable-plugin_name` is still supported and is the same as `--plugin_name=ON`. `--disable-plugin_name` and `--skip-plugin_name` are still supported and are the same as `--plugin_name=OFF`. (Bug #19027)

References: See also Bug #45336.

- **Important Change**: **Replication**: `BEGIN`, `COMMIT`, and `ROLLBACK` statements are no longer affected by `--replicate-do-db` [1634] or `--replicate-ignore-db` [1635] rules. (Bug #43263)

- **Partitioning**: Queries using `DISTINCT` on multiple columns or `GROUP BY` on multiple columns did not return correct results with partitioned tables. (Bug #44821)

  References: See also Bug #41136.

- **Replication**: The `Query_log_event` used by replication to transfer a query to the slave has been refactored. `Query_log_event` also stores and sends the error code resulting from the execution since it, in some cases, is necessary to execute the statement on the slave as well, which should result in the same error code. The `Query_log_event` constructor previously worked out for itself the error code using a complex routine, the result of which was often set aside within the constructor itself. This was also involved with at least 2 known bugs relating to invalid errors, and taken as a clear sign that the constructor was not well-designed and needed to be re-written. (Bug #41948)

References: See also Bug #37145.

- **Replication**: The warning `Statement is not safe to log in statement format`, issued in situations when it cannot be determined that a statement or other database event can be written reliably to the binary log using the statement-based format, has been changed to `Statement may not be safe to log in statement format`. (Bug #42415)

- **Replication**: When stopping and restarting the slave while it was replicating temporary tables, the slave server could crash or raise an assertion failure. This was due to the fact that, although temporary tables were saved between slave thread restarts, the reference to the thread being used (`table->in_use`) was not being properly updated when restarting, continuing to reference the old thread instead of the new one. This issue affected statement-based replication only. (Bug #41725)

- **Replication**: When using row-based logging, the length of an event for which the field metadata exceeded 255 bytes in size was incorrectly calculated. This could lead to corruption of the binary log, or cause the server to hang. (Bug #42749)

  References: See also Bug #44548, Bug #44672, Bug #44752.

- Running a `SELECT` query over an `IBMDB2I` table using the `cp1250` character set would produce an error

  ```
  ibmdb2i error 2027: Error converting single-byte sort sequence to UCS-2
  ```

  (Bug #45197)

- Use of `ROUND()` [977] on a `LONGTEXT` or `LONGBLOB` column of a derived table could cause a server crash. (Bug #45152)

- `DROP USER` could fail to drop all privileges for an account if the `PAD_CHAR_TO_FULL_LENGTH` [575] SQL mode was enabled. (Bug #45100)

- The combination of `MIN()` [1047] or `MAX()` [1046] in the select list with `WHERE` and `GROUP BY` clauses could lead to incorrect results. (Bug #45386)

- Compiler warnings on Mac OS X were fixed. (Bug #45286)

- Linker failures with `libmysqld` on VC++ 2008 were fixed. (Bug #45326)

- A separator was added between the time tag and the thread ID in the general query log file. (Bug #45387)

- A crash occurred due to a race condition between the merge table and `table_cache` evictions.

  (Bug #41212)

- When creating tables using the `IBMDB2I` storage engine, the `RCDFMT` (record format) that would be applied to the corresponding files within the IBM i would be set according to the table name. During whole table operations, the name could get modified to a value inconsistent with the table name. In addition, the record format would be inconsistent compared to the file content. The `IBMDB2I` storage engine now adds an explicit `RCDFMT` clause to the `CREATE TABLE` statement passed down to the DB2 storage engine layer. (Bug #44610)
- Running queries on tables with the `IBMDB2I` storage engine using the `utf8` character would fail when using the 64-bit version of MySQL. (Bug #44811)
- Trying to use an unsupported character set on an `IBMDB2I` table would produce DB2 error 2501 or 2511. The error has been updated to produce Error 2504 (Character set is unsupported). (Bug #44232)
- When using partitioning with the `IBMDB2I` storage engine, the engine could report that a valid character set was not supported. (Bug #44856)
- The `mysql` option `--ignore-spaces` [262] was nonfunctional. (Bug #39101)
- A multiple-table `DELETE` involving a table self-join could cause a server crash. (Bug #39918)
- If a query was such as to produce the error `1054 Unknown column '...' in 'field list'`, using `EXPLAIN EXTENDED` with the query could cause a server crash. (Bug #37362)
- For `DELETE` statements with `ORDER BY` *`var`*, where *`var`* was a global system variable with a `NULL` value, the server could crash. (Bug #42778)
- `SELECT ... INTO @var` could produce values different from `SELECT ...` without the `INTO` clause. (Bug #42009)
- Several Valgrind warnings were silenced. (Bug #44774, Bug #44792)
- A Valgrind warning related to transaction processing was silenced. (Bug #44664)
- `EXPLAIN EXTENDED` could crash for `UNION` queries in which the last `SELECT` was not parenthesized and included an `ORDER BY` clause. (Bug #43612)
- `UNCOMPRESSED_LENGTH()` [1031] returned a garbage result when passed a string shorter than 5 bytes. Now `UNCOMPRESSED_LENGTH()` [1031] returns `NULL` and generates a warning. (Bug #44796)
- Creating an `InnoDB` table with a comment containing a `'#'` character caused foreign key constraints to be omitted. (Bug #39793)
- `mysql_zap` did not work on Mac OS X. (Bug #41883)
- For views created with a column list clause, column aliases were not substituted when selecting through the view using a `HAVING` clause. (Bug #40825)
- `ALTER TABLE` on a view crashed the server. (Bug #44860)
- `innochecksum` could incorrectly determine the input file name from the arguments. (Bug #44484)
- Conversion of a string to a different character set could use the same buffer for input and output, leading to incorrect results or warnings. (Bug #44743, Bug #44766)
- Builds linked against OpenSSL had a memory leak in association with use of X509 certificates. (Bug #42158)
- On 64-bit Windows systems, `myisamchk` did not handle `key_buffer_size` values larger than 4GB. (Bug #43940)
- Multiple-table updates for `InnoDB` tables could produce unexpected results. (Bug #43580)

- `InnoDB` was missing `DB_ROLL_PTR` information in Table Monitor `COLUMNS` output. (Bug #44320)
- Lettercase conversion in multi-byte `cp932` or `sjis` character sequences could produce incorrect results. (Bug #44352)
- Assertion failure could occur for duplicate-key errors in `INSERT INTO ... SELECT` statements. (Bug #44306)
- Incorrect time was reported at the end of `mysqldump` output. (Bug #44424)
- `mysqld_safe` could fail to find the `logger` program. (Bug #44736)
- There was a race condition when changing `innodb_commit_concurrency` [1364] at runtime from zero to nonzero or from nonzero to zero. Now this variable cannot be changed at runtime from zero to nonzero or vice versa. The value can still be changed from one nonzero value to another. (Bug #42101)

  References: See also Bug #45749.
- Caching of `GROUP BY` expressions could lead to mismatches between compile-time and runtime calculations and cause a server crash. (Bug #44399)
- Selecting `RAND(N)` [975] function where *`N`* is a column of a `constant` table (table with a single row) failed with a `SIGFPE` signal. (Bug #44768)
- Invalidation of query cache entries due to table modifications could cause threads to hang inside the query cache with state “freeing items”. (Bug #43758)
- Shared-memory connections did not work in Vista if `mysqld` was started from the command line. (Bug #41190)
- Index Merge followed by a filesort could result in a server crash if `sort_buffer_size` [523] was not large enough for all sort keys. (Bug #44810)

  References: See also Bug #40974.
- The `PASSWORD()` [1030] and `OLD_PASSWORD()` [1030] functions could read memory outside of an internal buffer when used with `BLOB` arguments. (Bug #44767)
- For user-defined `utf8` collations, attempts to store values too long for a column could cause a server crash. (Bug #43827)
- Code that optimized a read-only XA transaction failed to reset the XID once the transaction was no longer active. (Bug #44672)
- `GROUP BY` on a `constant` (single-row) `InnoDB` table joined to other tables caused a server crash. (Bug #44886)
- In the `mysql` client, using a default character set of `binary` caused internal commands such as `DELIMITER` to become case sensitive. (Bug #37268)
- `ALTER TABLE` neglected to preserve `ROW_FORMAT` information from the original table, which could cause subsequent `ALTER TABLE` and `OPTIMIZE TABLE` statements to lose the row format for `InnoDB` tables. (Bug #39200)
- If the client lost the connection to the MySQL server after `mysql_stmt_prepare()`, the first call to `mysql_stmt_execute()` returned an error (as expected) but consecutive calls to `mysql_stmt_execute()` or `mysql_stmt_close()` crashed the client. (Bug #43560)
- Some Perl scripts in AIX packages contained an incorrect path to the `perl` executable. (Bug #44643)
- `mysqladmin kill` did not work for thread IDs larger than 32 bits. (Bug #32457)

- If the `MYSQL_HISTFILE` environment variable was set to `/dev/null`, the `mysql` client overwrote the `/dev/null` device file as a normal file. (Bug #34224)
- `mysqld_safe` mishandled certain parameters if they contained spaces. (Bug #33685)
- `mysqldump --tab` dumped triggers to `stdout` rather than to the `.sql` file for the corresponding table. (Bug #34861)
- Output from `mysql --html` did not encode the `'<'`, `'>'`, or `'&'` characters. (Bug #27884)
- `mysql_convert_table_format` did not prevent conversion of tables to `MEMORY` or `BLACKHOLE` tables, which could result in data loss. (Bug #27149)
- Several client programs failed to interpret `--skip-password` [225] as “send no password.” (Bug #28479)

Changes in MySQL 5.1.35 (2009-05-13)

Windows Notes

- This release of MySQL has two known outstanding issues for Windows:
  - The `.msi` installer does not detect an existing `root` password on the initial configuration attempt. To work around this, install and configure MySQL as normal, but skip any changes to security. (There is a check box that enables this on the security screen of the configuration wizard.) Then check your settings:
    - If the old `root` password and security settings are okay, you are done and can proceed to use MySQL.
    - Otherwise, reconfigure with the wizard and make any changes on the second configuration attempt. The wizard will properly prompt for the existing `root` password and permit changes to be made.

    This issue has been filed as Bug #45200 for correction in a future release.
  - The Windows configuration wizard permits changes to `InnoDB` settings during a reconfiguration operation. For an upgrade, this may cause difficulties. To work around this, use one of the following alternatives:
    - Do not change `InnoDB` settings.
    - Copy files from the old `InnoDB` location to the new one.

    This issue has been filed as Bug #45201 for correction in a future release.

Bugs Fixed

- **Performance**: If the character set for a column being compared was neither the default server character set nor `latin1`, `InnoDB` was slower than necessary due to excessive contention for a character set mutex.

  As a workaround for earlier versions, set the default server character set to the character set other than `latin1` that is most often used in indexed columns. (Bug #42649)
- **Performance**: `InnoDB` uses random numbers to generate dives into indexes for calculating index cardinality. However, under certain conditions, the algorithm did not generate random numbers, so `ANALYZE TABLE` did not update cardinality estimates properly. A new algorithm has been introduced with better randomization properties, together with a system variable, `innodb_use_legacy_cardinality_algorithm` [1384], that controls which algorithm to use. The default value of the variable is 1 (`ON`), to use the original algorithm for compatibility with existing

applications. The variable can be set to 0 (`OFF`) to use the new algorithm with improved randomness. (Bug #43660)

- **Important Change**: **Replication**: The transactional behavior of `STOP SLAVE` has changed. Formerly, it took effect immediately, even inside a transaction; now, it waits until the current replication event group (if any) has finished executing, or until the user issues a `KILL QUERY` or `KILL CONNECTION` statement.

  This was done to solve the problem encountered when replication was stopped while a nontransactional slave was replicating a transaction on the master. (It was impossible to roll back a mixed-engines transaction when one of the engines was nontransactional, which meant that the slave could not safely re-apply any transaction that had been interrupted by `STOP SLAVE`.) (Bug #319, Bug #38205)

  References: See also Bug #43217.

- **Partitioning**: When a value was equal to a `PARTITION ... VALUES LESS THAN (value)` value other than `MAXVALUE`, the corresponding partition was not pruned. (Bug #42944)

- **Replication**: Unrelated errors occurring during the execution of `RESET SLAVE` could cause the slave to crash. (Bug #44179)

- **Replication**: The `--slave-skip-errors` [1641] option had no effect when using row-based logging format. (Bug #39393)

- **Replication**: The following errors were not correctly reported:

  - Failures during slave thread initialization
  - Failures while initializing the relay log position (immediately following the starting of the slave thread)
  - Failures while processing queries passed through the `--init_slave` option.

  Information about these types of failures can now be found in the output of `SHOW SLAVE STATUS`. (Bug #38197)

- **Replication**: Killing the thread executing a DDL statement, after it had finished its execution but before it had written the binlog event, caused the error code in the binlog event to be set (incorrectly) to `ER_SERVER_SHUTDOWN` or `ER_QUERY_INTERRUPTED`, which caused replication to fail. (Bug #37145)

  References: See also Bug #27571, Bug #22725.

- **Replication**: Column aliases used inside subqueries were ignored in the binary log. (Bug #35515)

- MySQL Server permitted the creation of a merge table based on views but crashed when attempts were made to read from that table. The following example demonstrates this:

```
#Create a test table
CREATE TABLE tmp (id int, c char(2));

#Create two VIEWs upon it
CREATE VIEW v1 AS SELECT * FROM tmp;
CREATE VIEW v2 AS SELECT * FROM tmp;

#Finally create a MERGE table upon the VIEWs
CREATE TABLE merge (id int, c char(2))
ENGINE=MERGE UNION(v1, v2);

#Reading from the merge table lead to a crash
SELECT * FROM merge;
```

  The final statement generated the crash. (Bug #44040)

- The `ucs2_swedish_ci` and `utf8_swedish_ci` collations did not work with indexes using the `IBMDB2I` storage engine. Support is now provided for MySQL when running on IBM i 6.1 or higher. (Bug #44020)
- Some schema names longer than 8 characters were not supported by `IBMDB2I`. The engine has been updated to permit digits and underscore characters to be used in names longer than 8 characters. (Bug #44025)
- In some circumstances, when a table is created with the `IBMDB2I` engine, the `CREATE TABLE` statement will return successfully but the table will not exist. (Bug #44022)
- Using an XML function such as `ExtractValue()` [1016] more than once in a single query could produce erroneous results. (Bug #43183)

  References: See also Bug #43937.
- For some queries, an equality propagation problem could cause `a = b` and `b = a` to be handled differently. (Bug #40925)
- `CHECK TABLE` did not properly check whether `MyISAM` tables created by servers from MySQL 4.0 or older needed to be upgraded. This could cause problems upgrading to MySQL 5.1 or higher. (Bug #37631)
- On Windows, running the server with `myisam_use_mmap` [504] enabled caused `MyISAM` table corruption. (Bug #38848)
- Valgrind warnings for the `DECODE()` [1029], `ENCRYPT()` [1030], and `FIND_IN_SET()` [952] functions were corrected. (Bug #44358, Bug #44365, Bug #44367)
- `CHECK TABLE` suggested use of `REPAIR TABLE` for corrupt tables for storage engines not supported by `REPAIR TABLE`. Now `CHECK TABLE` suggests that the user dump and reload the table. (Bug #42563)
- A stored routine contain a C-style comment could not be dumped and reloaded. (Bug #39559)
- A multiple-table `DELETE IGNORE` statement involving a foreign key constraint caused an assertion failure. (Bug #40127)
- The `mysql_setpermission` operation for removing database privileges removed global privileges instead. (Bug #39852)
- Multiple-table `UPDATE` statements did not properly activate triggers. (Bug #39953)
- In an `UPDATE` or `DELETE` through a secondary index, `InnoDB` did not store the cursor position. This made `InnoDB` crash in semi-consistent read while attempting to unlock a nonmatching record. (Bug #39320)
- Compressing a table with the `myisampack` utility caused the server to produce Valgrind warnings when it opened the table. (Bug #41541)
- For a `MyISAM` table with `DELAY_KEY_WRITE` enabled, the index file could be corrupted without the table being marked as crashed if the server was killed. (Bug #41330)
- Killing an `INSERT ... SELECT` statement for a `MyISAM` table could cause table corruption if the table had indexes. (Bug #40827)
- Incomplete cleanup of `JOIN_TAB::select` during the filesort of rows for a `GROUP BY` clause inside a subquery caused a server crash. (Bug #44290)
- Incorrect elevation of warning messages to error messages for unsafe statements caused a server crash. (Bug #42640)
- `ALTER DATABASE ... UPGRADE DATA DIRECTORY NAME` failed when the database contained views. (Bug #43385)

- `UNION` of floating-point numbers did unnecessary rounding. (Bug #43432)
- Certain statements might open a table and then wait for an impending global read lock without noticing whether they hold a table being waiting for by the global read lock, causing a hang. Affected statements are `SELECT ... FOR UPDATE`, `LOCK TABLES ... WRITE`, `TRUNCATE TABLE`, and `LOAD DATA INFILE`. (Bug #43230)
- Incorrect initialization of `MyISAM` table indexes could cause incorrect query results. (Bug #43737)
- `libmysqld` crashed when it was reinitialized. (Bug #43706, Bug #44091)
- On Windows, entries for `build-vs9.bat` and `build-vs9_x64.bat` were missing in `win/Makefile.am`. (Bug #44353)
- Full-text prefix searches could hang the connection and cause 100% CPU consumption. (Bug #42907)
- `SHOW VARIABLES` did not properly display the value of `slave_skip_errors` [1645]. (Bug #43835)
- On 64-bit systems, a `key_buffer_size` [483] value larger than 4GB could couse `MyISAM` index corruption. (Bug #43932)
- `myisamchk` could display a negative `Max keyfile length` value. (Bug #43950)
- Invoking `SHOW TABLE STATUS` from within a stored procedure could cause a `Packets out of order` error. (Bug #43962)
- Use of `HANDLER` statements with `INFORMATION_SCHEMA` tables caused a server crash. Now `HANDLER` is prohibited with such tables. (Bug #44151)
- Not all lock types had proper descriptive strings, resulting in garbage output from `mysqladmin debug`. (Bug #44164)
- On Windows, a server crash occurred for attempts to insert a floating-point value into a `CHAR` column with a maximum length less than the converted floating-point value length. (Bug #43833)
- The functions listed in Creating Geometry Values Using MySQL-Specific Functions, previously accepted WKB arguments and returned WKB values. They now accept WKB or geometry arguments and return geometry values.

  The functions listed in Creating Geometry Values Using WKB Functions, previously accepted WKB arguments and returned geometry values. They now accept WKB or geometry arguments and return geometry values. (Bug #38990)
- `mysqld_multi` incorrectly passed `--no-defaults` to `mysqld_safe`. (Bug #43876)
- `CHECKSUM TABLE` was not killable with `KILL QUERY`. (Bug #33146)
- `myisamchk` and `myisampack` were not being linked with the library that enabled support for `*` file name pattern expansion. (Bug #29248)
- An `UPDATE` statement that updated a column using the same `DES_ENCRYPT()` [1029] value for each row actually updated different rows with different values. (Bug #35087)
- For shared-memory connections, the read and write methods did not properly handle asynchronous close events, which could lead to the client locking up waiting for a server response. For example, a call to `mysql_real_query()` would block forever on the client side if the executed statement was aborted on the server side. Thanks to Armin Schöffmann for the bug report and patch. (Bug #33899)
- For `InnoDB` tables that have their own `.ibd` tablespace file, a superfluous `ibuf cursor restoration fails!` message could be written to the error log. This warning has been suppressed. (Bug #27276)

- Several memory allocation functions were not being checked for out-of-memory return values. (Bug #25058)
- `COMMIT` did not delete savepoints if there were no changes in the transaction. (Bug #26288)

Changes in MySQL Enterprise 5.1.34sp1 [QSP] (2009-06-25)

This is a *Service Pack* release of the MySQL Enterprise Server 5.1.

This section documents all changes and bugfixes that have been applied since the last MySQL Enterprise Server release (5.1.34).

Note

The fix for Bug #40974 in MySQL 5.1.31 caused the regression problem reported in Bug #44810. Users for whom stability is of utmost priority should note that 5.1.34sp1 is affected by this problem because Bug #44810 is not fixed until MySQL 5.1.36.

If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see http://www.mysql.com/products/enterprise/advisors.html.

Bugs Fixed

- Using an XML function such as `ExtractValue()` [1016] more than once in a single query could produce erroneous results. (Bug #43183)

  References: See also Bug #43937.

- In an `UPDATE` or `DELETE` through a secondary index, `InnoDB` did not store the cursor position. This made `InnoDB` crash in semi-consistent read while attempting to unlock a nonmatching record. (Bug #39320)
- Incomplete cleanup of `JOIN_TAB::select` during the filesort of rows for a `GROUP BY` clause inside a subquery caused a server crash. (Bug #44290)
- Incorrect elevation of warning messages to error messages for unsafe statements caused a server crash. (Bug #42640)
- Certain statements might open a table and then wait for an impending global read lock without noticing whether they hold a table being waiting for by the global read lock, causing a hang. Affected statements are `SELECT ... FOR UPDATE`, `LOCK TABLES ... WRITE`, `TRUNCATE TABLE`, and `LOAD DATA INFILE`. (Bug #43230)
- `libmysqld` crashed when it was reinitialized. (Bug #43706, Bug #44091)
- On 64-bit systems, a `key_buffer_size` [483] value larger than 4GB could couse `MyISAM` index corruption. (Bug #43932)
- Use of `HANDLER` statements with `INFORMATION_SCHEMA` tables caused a server crash. Now `HANDLER` is prohibited with such tables. (Bug #44151)
- On Windows, a server crash occurred for attempts to insert a floating-point value into a `CHAR` column with a maximum length less than the converted floating-point value length. (Bug #43833)
- The functions listed in Creating Geometry Values Using MySQL-Specific Functions, previously accepted WKB arguments and returned WKB values. They now accept WKB or geometry arguments and return geometry values.

The functions listed in Creating Geometry Values Using WKB Functions, previously accepted WKB arguments and returned geometry values. They now accept WKB or geometry arguments and return geometry values. (Bug #38990)

Changes in MySQL 5.1.34 (2009-04-02)

AIX Notes

- Support Ending for AIX 5.2: Per the http://www.mysql.com/about/legal/lifecycle/ regarding ending support for OS versions that have reached vendor end of life, we plan to discontinue building or supporting MySQL binaries for AIX 5.2 as of April 30, 2009. This release of MySQL 5.1 (5.1.34) is the last MySQL 5.1 release with support for AIX 5.2. For more information, see the March 24, 2009 note at MySQL Product Support EOL Announcements.

Functionality Added or Changed

- The `optimizer_switch` [509] system variable is now available to control optimizations that can be switched on and off. See Controlling Switchable Optimizations.

Bugs Fixed

- **Replication**: **Important Note**: Binary logging with `--binlog-format=ROW` [1654] failed when a change to be logged included more than 251 columns. This issue was not known to occur with mixed-format or statement-based logging. (Bug #42977)

  References: See also Bug #42914.

- **Replication**: Assigning an invalid directory for the `--slave-load-tmpdir` [1640] caused the replication slave to crash. (Bug #42861)

- **Replication**: The `mysql.procs_priv` system table was not replicated. (Bug #42217)

- **Replication**: An `INSERT DELAYED` into a `TIMESTAMP` column issued concurrently with an insert on the same column not using `DELAYED`, but applied after the other insert, was logged using the same timestamp as generated by the other (non-`DELAYED`) insert. (Bug #41719)

- **Replication**: The `MIXED` binary logging format did not switch to row-based mode for statements containing the `LOAD_FILE()` [953] function. (Bug #39701)

- **Replication**: When the server SQL mode included `IGNORE_SPACE` [573], statement-based replication of `LOAD DATA INFILE ... INTO tbl_name` failed because the statement was read incorrectly from the binary log; a trailing space was omitted, causing the statement to fail with a syntax error when run on the slave. (Bug #22504)

  References: See also Bug #43746.

- The MySQL Instance Configuration Wizard would fail to start correctly on Windows Vista. (Bug #42386)

- When running the MySQL Instance Configuration Wizard in command-line only mode, the service name would be ignored (effectively creating all instances with the default `MySQL` service name), irrespective of the name specified on the command line. However, the wizard would attempt to start the service with the specified name, and would fail. (Bug #38379)

- The `load_defaults()`, `my_search_option_files()` and `my_print_default_files()` functions in the C client library were subject to a race condition in multi-threaded operation. (Bug #40552)

- Queries of the following form returned an empty result:

  ```
  SELECT ... WHERE ... (col=col AND col=col) OR ... (false expression)
  ```

  (Bug #42957)

- The `strings/CHARSET_INFO.txt` file was not included in source distributions. (Bug #42937)
- On Windows, incorrectly specified link dependencies in `CMakeLists.txt` resulted in link errors for `mysql_embedded`, `mysqltest_embedded`, and `mysql_client_test_embedded`. (Bug #43715)
- If `--basedir` [241] was specified, `mysqld_safe` did not use it when attempting to locate `my_print_defaults`. (Bug #39326)
- In the `help` command output displayed by `mysql`, the description for the `\c` (`clear`) command was misleading. (Bug #41268)
- A dangling pointer in `mysys/my_error.c` could lead to client crashes. (Bug #42675)
- An attempt by a user who did not have the `SUPER` [628] privilege to kill a system thread could cause a server crash. (Bug #43748)
- `mysql` crashed if a request for the current database name returned an empty result, such as after the client has executed a preceding `SET sql_select_limit=0` statement. (Bug #43254)
- With more than two arguments, `LEAST()` [943], `GREATEST()` [942], and `CASE` [946] could unnecessarily return `Illegal mix of collations` errors. (Bug #41627)
- Passing an unknown time zone specification to `CONVERT_TZ()` [981] resulted in a memory leak. (Bug #42502)
- The `mysql` client could misinterpret its input if a line was longer than an internal buffer. (Bug #41486)
- If the value of the `version_comment` system variable was too long, the `mysql` client displayed a truncated startup message. (Bug #43153)
- An attempt to check or repair an `ARCHIVE` table that had been subjected to a server crash returned a 144 internal error. The data appeared to be irrecoverable. (Bug #32880)
- Setting the `join_buffer_size` [482] variable to its minimum value produced spurious warnings. (Bug #36446)
- When MySQL was configured with the `--with-max-indexes=128` option, `mysqld` crashed. (Bug #36751)
- The use of `NAME_CONST()` [1042] can result in a problem for `CREATE TABLE ... SELECT` statements when the source column expressions refer to local variables. Converting these references to `NAME_CONST()` [1042] expressions can result in column names that are different on the master and slave servers, or names that are too long to be legal column identifiers. A workaround is to supply aliases for columns that refer to local variables.

  Now a warning is issued in such cases that indicate possible problems. (Bug #35383)
- The `Time` column for `SHOW PROCESSLIST` output and the value of the `TIME` column of the `INFORMATION_SCHEMA.PROCESSLIST` table now can have negative values. Previously, the column was unsigned and negative values were displayed incorrectly as large positive values. Negative values can occur if a thread alters the time into the future with `SET TIMESTAMP = value` or the thread is executing on a slave and processing events from a master that has its clock set ahead of the slave. (Bug #22047)
- Restoring a `mysqldump` dump file containing `FEDERATED` tables failed because the file contained the data for the table. Now only the table definition is dumped (because the data is located elsewhere). (Bug #21360)

Changes in MySQL 5.1.33 (2009-03-13)

AIX Notes

- Support Ending for AIX 5.2: Per the http://www.mysql.com/about/legal/lifecycle/ regarding ending support for OS versions that have reached vendor end of life, we plan to discontinue building or

supporting MySQL binaries for AIX 5.2 as of April 30, 2009. The next release of MySQL 5.1 (5.1.34) will be the last MySQL 5.1 release with support for AIX 5.2. For more information, see the March 24, 2009 note at MySQL Product Support EOL Announcements.

Functionality Added or Changed

- **Performance**: The query cache now checks whether a `SELECT` statement begins with `SQL_NO_CACHE` to determine whether it can skip checking for the query result in the query cache. This is not supported when `SQL_NO_CACHE` occurs within a comment. (Bug #37416)
- The MD5 algorithm now uses the Xfree implementation. (Bug #42434)
- `mysql-test-run.pl` now supports an `--experimental=file_name` option. It enables you to specify a file that contains a list of test cases that should be displayed with the `[ exp-fail ]` code rather than `[ fail ]` if they fail. (Bug #42888)

Bugs Fixed

- **Partitioning**: A duplicate key error raised when inserting into a partitioned table using a different error code from that returned by such an error raised when inserting into a table that was not partitioned. (Bug #38719)

  References: See also Bug #28842.

- **Partitioning**: Several error messages relating to partitioned tables were incorrect or missing. (Bug #36001)
- **Replication**: When `binlog_format` [1654] was set to `STATEMENT`, a statement unsafe for statement-based logging caused an error or warning to be issued even if `sql_log_bin` [525] was set to 0. (Bug #41980)
- **Replication**: When using `MIXED` replication format and temporary tables were created in statement-based mode, but a later operation in the same session caused a switch to row-based mode, the temporary tables were not dropped on the slave at the end of the session. (Bug #40013)

  References: See also Bug #43046. This bug was introduced by Bug #20499.

- **Replication**: If `--secure-file-priv` [442] was set on the slave, it was unable to execute `LOAD DATA INFILE` statements sent from the master when using mixed-format or statement-based replication.

  As a result of this fix, this security restriction is now ignored on the slave in such cases; instead the slave checks whether the files were created and should be read by the slave in its `--slave-load-tmpdir` [1640]. (Bug #38174)

- **Replication**: The server SQL mode in effect when a stored procedure was created was not retained in the binary log. This could cause a `CREATE PROCEDURE` statement that succeeded on the master to fail on the slave.

  This issue was first noticed when a stored procedure was created when `ANSI_QUOTES` [572] was in effect on the master, but could possibly cause failed `CREATE PROCEDURE` statements and other problems on the slave when using other server SQL modes as well. (Bug #39526)

- **Replication**: When using the `MIXED` replication format, `UPDATE` and `DELETE` statements that searched for rows where part of the key had nullable `BIT` columns failed. This occurred because operations that inserted the data were replicated as statements, but `UPDATE` and `DELETE` statements affecting the same data were replicated using row-based format.

  This issue did not occur when using statement-based replication (only) or row-based replication (only). (Bug #39753)

  References: See also Bug #39648.

- **Replication**: Server IDs greater than 2147483647 (2^{32} – 1) were represented by negative numbers in the binary log. (Bug #37313)

- **Replication**: When its disk becomes full, a replication slave may wait while writing the binary log, relay log or `MyISAM` tables, continuing after space has been made available. The error message provided in such cases was not clear about the frequency with which checking for free space is done (once every 60 seconds), and how long the server waits after space has been freed before continuing (also 60 seconds); this caused users to think that the server had hung.

  These issues have been addressed by making the error message clearer, and dividing it into two separate messages:

  1. The error message `Disk is full writing 'filename' (Errcode: error_code). Waiting for someone to free space... (Expect up to 60 secs delay for server to continue after freeing disk space)` is printed only once.

  2. The warning `Retry in 60 secs, Message reprinted in 600 secs` is printed once every for every 10 times that the check for free space is made; that is, the check is performed once each 60 seconds, but the reminder that space needs to be freed is printed only once every 10 minutes (600 seconds).

  (Bug #22082)

- **Replication**: The statements `DROP PROCEDURE IF EXISTS` and `DROP FUNCTION IF EXISTS` were not written to the binary log if the procedure or function to be dropped did not exist. (Bug #13684)

  References: See also Bug #25705.

- The IBM DB2i storage engine has been added to this release for the IBM i Series platform. For more information, see The `IBMDB2I` Storage Engine. (Bug #44217)

- MySQL 5.1 crashed with index merge algorithm and merge tables.

  A query in the MyISAM merge table caused a crash if the index merge algorithm was being used. (Bug #40675)

- An earlier bug fix resulted in the problem that the `InnoDB` plugin could not be used with a server that was compiled with the built-in `InnoDB`. To handle this two changes were made:

  - The server now supports an `--ignore-builtin-innodb` [1358] option that causes the server to behave as if the built-in `InnoDB` is not present. This option causes other `InnoDB` options not to be recognized.

  - For the `INSTALL PLUGIN` statement, the server reads option (`my.cnf`) files just as during server startup. This enables the plugin to pick up any relevant options from those files. Consequently, a plugin no longer is started with each option set to its default value.

    Because of this change, it is possible to add plugin options to an option file even before loading a plugin (if the `loose` prefix is used). It is also possible to uninstall a plugin, edit `my.cnf`, and install the plugin again. Restarting the plugin this way enables it to the new option values without a server restart.

Note

`InnoDB` Plugin versions 1.0.4 and higher will take advantage of this bug fix. Although the `InnoDB` Plugin is source code compatible with multiple MySQL releases, a given binary `InnoDB` Plugin can be used only with a specific MySQL release. When `InnoDB` Plugin 1.0.4 is released, it is expected to be compiled for MySQL 5.1.34. For 5.1.33, you can use `InnoDB` Plugin 1.0.3, but you must build from source.

(Bug #42610)

References: This bug was introduced by Bug #29263.

- The `innodb_log_arch_dir` system variable is no longer available but was present in some of the sample option files included with MySQL distributions (such as `my-huge.cnf`). The line was present as a comment but uncommenting it would cause server startup failure so the line has been removed. (Bug #38249)
- On Windows, starting the server with an invalid value for `innodb_flush_method` [1368] caused a crash. (Bug #40757)
- Parsing of the optional microsecond component of `DATETIME` values did not fail gracefully when that component width was larger than the permitted six places. (Bug #42146)
- `mysqldumpslow` parsed the `--debug` [361] and `--verbose` [362] options incorrectly. (Bug #42027)
- Tables could enter open table cache for a thread without being properly cleaned up, leading to a server crash. (Bug #42419)
- On 32-bit Windows, `mysqld` could not use large buffers due to a 2GB user mode address limit. (Bug #43082)
- Queries that used the loose index scan access method could return no rows. (Bug #41610)
- Use of `SELECT *` permitted users with rights to only some columns of a view to access all columns. (Bug #41354)
- The server did not robustly handle problems hang if a table opened with `HANDLER` needed to be re-opened because it had been altered to use a different storage engine that does not support `HANDLER`. The server also failed to set an error if the re-open attempt failed. These problems could cause the server to crash or hang. (Bug #41110, Bug #41112)
- For a view that references a table in another database, `mysqldump` wrote the view name qualified with the current database name. This makes it impossible to reload the dump file into a different database. (Bug #40345)
- `perror` did not produce correct output for error codes 153 to 163. (Bug #39370)
- Comparisons between row constructors, such as `(a, b) = (c, d)` resulted in unnecessary `Illegal mix of collations` errors for string columns. (Bug #37601)
- For prepared statements, multi-byte character sets were not taking into account when calculating `max_length` for string values and `mysql_stmt_fetch()` could return truncated strings. (Bug #41078)
- Use of `USE INDEX` hints could cause `EXPLAIN EXTENDED` to crash. (Bug #43354)
- For `InnoDB` tables, overflow in an `AUTO_INCREMENT` column could cause a server crash. (Bug #43203)
- `stderr` should be unbuffered, but when the server redirected `stderr` to a file, it became buffered. (Bug #42790)
- For `InnoDB` tables, spurious duplicate-key errors could occur when inserting into an `AUTO_INCREMENT` column. (Bug #42714)
- For `InnoDB` tables, inserting into floating-point `AUTO_INCREMENT` columns failed. (Bug #42400)
- The `InnoDB` `btr_search_drop_page_hash_when_freed()` function had a race condition. (Bug #42279)

- The `DATA_TYPE` column of the `INFORMATION_SCHEMA.COLUMNS` table displayed the `UNSIGNED` attribute for floating-point data types. (The column should contain only the data type name.) (Bug #42758)
- `mysqldump` included views that were excluded with the `--ignore-table` [297] option. (Bug #42635)
- With the `ONLY_FULL_GROUP_BY` [575] SQL mode enabled, some legal queries failed. (Bug #42567)
- The error message for a too-long column comment was `Unknown error` rather than a more appropriate message. (Bug #41465)
- `SELECT` statements executed concurrently with `INSERT` statements for a `MyISAM` table could cause incorrect results to be returned from the query cache. (Bug #41098)
- Deprecation warnings that referred to MySQL 5.2 were changed to refer to MySQL 6.0. (Bug #41077)
- `--help` [325] output for `myisamchk` did not list the `--HELP` [325] option. (Bug #38103)
- For user-defined variables in a query result, incorrect length values were returned in the result metadata. (Bug #41030)
- Several functions in `libmysqld` called `exit()` when an error occurred rather than returning an error to the caller. (Bug #39289)
- On platforms where long and pointer variables have different sizes, `MyISAM` could copy key statistics incorrectly, resulting in a server crash or incorrect cardinality values. (Bug #40321)
- If a user created a view that referenced tables for which the user had disjoint privileges, an assertion failure occurred. (Bug #37191)
- `DELETE` tried to acquire write (not read) locks for tables accessed within a subquery of the `WHERE` clause. (Bug #39843)
- Table temporary scans were slower than necessary due to use of mmap rather than caching, even with the `myisam_use_mmap` [504] system variable disabled. (Bug #40634)
- With strict SQL mode enabled, setting a system variable to an out-of-bounds value caused an assertion failure. (Bug #40657)
- On 64-bit debug builds, code in `safemalloc` resulted in errors due to use of a 32-bit value for 64-bit allocations. (Bug #43885)
- For `InnoDB` tables, there was a race condition for `ALTER TABLE`, `OPTIMIZE TABLE`, `CREATE INDEX`, and `DROP INDEX` operations when periodically checking whether table copying can be committed. (Bug #42152)
- In `InnoDB` recovery after a server crash, table lookup could fail and corrupt the data dictionary cache. (Bug #42075)
- In `InnoDB` recovery after a server crash, rollback of a transaction that updated a column from `NULL` to `NULL` could cause another crash. (Bug #41571)
- Setting a savepoint with the same name as an existing savepoint incorrectly deleted any other savepoints that had been set in the meantime. For example, setting savepoints named `a`, `b`, `c`, `b` resulted in savepoints `a`, `b`, rather than the correct savepoints `a`, `c`, `b`. (Bug #38187)
- `make distcheck` failed to properly handle subdirectories of `storage/ndb`. (Bug #43614)
- If the tables underlying a `MERGE` table had a primary key but the `MERGE` table itself did not, inserting a duplicate row into the `MERGE` table caused a server crash. (Bug #41305)

- On Windows, the `_PC` macro in `my_global.h` was causing problems for modern compilers. It has been removed because it is no longer used. (Bug #34309)
- `mysqld --help` did not work as `root`. (Bug #30261)
- For `DROP FUNCTION` with names that were qualified with a database name, the database name was handled in case-sensitive fashion even with `lower_case_table_names` [492] set to 1. (Bug #33813)
- An argument to the `MATCH()` [998] function that was an alias for an expression other than a column name caused a server crash. (Bug #36737)
- `mysqldump --compatible=mysql40` emitted statements referring to the `character_set_client` [464] system variable, which is unknown before MySQL 4.1. Now the statements are enclosed in version-specific comments. (Bug #33550)
- `SHOW PRIVILEGES` listed the `CREATE ROUTINE` [626] privilege as having a context of `Functions,Procedures`, but it is a database-level privilege. (Bug #30305)
- The `mysql` client mishandled input parsing if a `delimiter` command was not first on the line. (Bug #31060)
- Use of MBR spatial functions such as `MBRTouches()` [1072] with columns of `InnoDB` tables caused a server crash rather than an error. (Bug #31435)
- `CHECK TABLE`, `REPAIR TABLE`, `ANALYZE TABLE`, and `OPTIMIZE TABLE` erroneously reported a table to be corrupt if the table did not exist or the statement was terminated with `KILL`. (Bug #29458)
- The `event`, `general_log`, and `slow_log` tables in the `mysql` database store `server_id` [521] values, but did not use an `UNSIGNED` column and thus were not able to store the full range of ID values. (Bug #36540)
- Detection by `configure` of several functions such as `setsockopt()`, `bind()`, `sched_yield()`, and `gtty()` could fail. (Bug #31506)
- Allocation of stack space for error messages could be too small on HP-UX, leading to stack overflow crashes. (Bug #21476)
- `SHOW TABLE STATUS` could fail to produce output for tables with non-ASCII characters in their name. (Bug #25830)
- Floating-point numbers could be handled with different numbers of digits depending on whether the text or prepared-statement protocol was used. (Bug #21205)
- `ROUND()` [977] sometimes returned different results on different platforms. (Bug #15936)
- Incorrect length metadata could be returned for `LONG TEXT` columns when a multi-byte server character set was used. (Bug #19829)

Changes in MySQL 5.1.32 (2009-02-14)

Functionality Added or Changed

- The `libedit` library was upgraded to version 2.11. (Bug #42433)

Bugs Fixed

- **Security Fix**: Using an XPath expression employing a scalar expression as a FilterExpr with `ExtractValue()` [1016] or `UpdateXML()` [1018] caused the server to crash. Such expressions now cause an error instead. (Bug #42495)
- **Incompatible Change**: The fix for Bug #33699 introduced a change to the `UPDATE` statement such that assigning `NULL` to a `NOT NULL` column caused an error even when strict SQL mode was not

enabled. The original behavior before was that such assignments caused an error only in strict SQL mode, and otherwise set the column to the implicit default value for the column data type and generated a warning. (For information about implicit default values, see Data Type Default Values.)

The change caused compatibility problems for applications that relied on the original behavior. It also caused replication problems between servers that had the original behavior and those that did not, for applications that assigned `NULL` to `NOT NULL` columns in `UPDATE` statements without strict SQL mode enabled. This change has been reverted so that `UPDATE` again had the original behavior. Problems can still occur if you replicate between servers that have the modified `UPDATE` behavior and those that do not. (Bug #39265)

- **Important Change**: When using the MySQL Instance Configuration Wizard with a configuration where you already have an existing installation with a custom `datadir`, the wizard could reset the data to the default data directory. When performing an upgrade installation in this situation, you must re-specify your custom settings, including the `datadir`, to ensure that your configuration file is not reset to the default values. (Bug #37534)

- **Important Change**: Uninstalling MySQL using the MySQL installer on Windows would delete the `my.ini` file. The file is no longer deleted. In addition, when a new installation is conducted, any existing configuration file will be renamed to `myDATETIME.ini.bak` during configuration. (Bug #36493)

- **Important Change**: When installing MySQL on Windows, it was possible to install multiple editions (Complete, and Essential, for example) of the same version of MySQL, leading to two separate entries in the installed packages which were impossible to isolate. This could lead to problems with installation and uninstallation. The MySQL installer on Windows no longers permits multiple installations of the same version of MySQL on a single machine. (Bug #4217)

- **Replication**: `START SLAVE UNTIL` did not work correctly with `--replicate-same-server-id` [1637] enabled; when started with this option, the slave did not perform events recorded in the relay log and that originated from a different master.

  Log rotation events are automatically generated and written when rotating the binary log or relay log. Such events for relay logs are usually ignored by the slave SQL thread because they have the same server ID as that of the slave. However, when `--replicate-same-server-id` [1637] was enabled, the rotation event for the relay log was treated as if it originated on the master, because the log's name and position were incorrectly updated. This caused the `MASTER_POS_WAIT()` [1042] function always to return `NULL` and thus to fail. (Bug #38734, Bug #38934)

- **Replication**: `TRUNCATE TABLE` statements failed to replicate when statement-based binary logging mode was not available. The issue was observed when using `InnoDB` with the transaction isolation level set to `READ UNCOMMITTED` (thus forcing `InnoDB` not to permit statement-based logging). However, the same behavior could be reproduced using any transactional storage engine supporting only row-based logging, regardless of the isolation level. This was due to two separate problems:

  1. An error was printed by `InnoDB` for `TRUNCATE TABLE` when using statement-based logging mode where the transaction isolation level was set to `READ COMMITTED` or `READ UNCOMMITTED`, because `InnoDB` permits statement-based replication for DML statements. However, `TRUNCATE TABLE` is not transactional; since it is the equivalent of `DROP TABLE` followed by `CREATE TABLE`, it is actually DDL, and should therefore be permitted to be replicated as a statement.

  2. `TRUNCATE TABLE` was not logged in mixed mode because of the error just described; however, this error was not reported to the client.

  As a result of this fix, `TRUNCATE TABLE` is now treated as DDL for purposes of binary logging and replication; that is, it is always logged as a statement and so no longer causes an error when replicated using a transactional storage engine such as `InnoDB`. (Bug #36763)

  References: See also Bug #42643.

- **Replication**: `mysqlbinlog` replay of `CREATE TEMPORARY TABLE ... LIKE` statements and of `TRUNCATE TABLE` statements used on temporary tables failed with Error 1146 (`Table ... doesn't exist`). (Bug #35583)
- **Replication**: `LOAD DATA INFILE` statements did not replicate correctly from a master running MySQL 4.1 to a slave running MySQL 5.1 or later. (Bug #31240)
- **Replication**: In statement mode, `mysqlbinlog` failed to issue a `SET @@autommit` statement when the autocommit mode was changed. (Bug #34541)
- When using the MySQL MSI Installer on Windows and selecting Back after a choosing Repair, you would be returned to the Fresh Install section of the installer. You are now correctly returned to the Install, Repair, Modify screen. (Bug #37294)
- When a `MEMORY` table became full, the error generated was returned to the client but was not written to the error log. (Bug #39886)
- Use of `COUNT(DISTINCT)` [1045] prevented `NULL` testing in the `HAVING` clause. (Bug #38637)
- The SSL certificates included with MySQL distributions were regenerated because the previous ones had expired. (Bug #42366)
- The Windows installer displayed incorrect product names in some images. (Bug #40845)
- The expression `ROW(...) IN (SELECT ... FROM DUAL)` always returned `TRUE`. (Bug #39069)
- User variables within triggers could cause a crash if the `mysql_change_user()` C API function was invoked. (Bug #42188)
- `REPAIR TABLE` crashed for compressed `MyISAM` tables. (Bug #41574)
- For a `TIMESTAMP NOT NULL DEFAULT ...` column, storing `NULL` as the return value from some functions caused a “cannot be NULL” error. `NULL` returns now correctly cause the column default value to be stored. (Bug #41370)
- Enabling the `sync_frm` [528] system variable had no effect on the handling of `.frm` files for views. (Bug #38145)
- The query cache stored only partial query results if a statement failed while the results were being sent to the client. This could cause other clients to hang when trying to read the cached result. Now if a statement fails, the result is not cached. (Bug #40264)
- Setting `myisam_repair_threads` [502] greater than 1 caused a server crash for table repair or alteration operations for `MyISAM` tables with multiple `FULLTEXT` indexes. (Bug #37756)
- The greedy optimizer could cause a server crash due to improper handling of nested outer joins. (Bug #38795)
- Dependent subqueries such as the following caused a memory leak proportional to the number of outer rows:

```
SELECT COUNT(*) FROM t1, t2 WHERE t2.b
  IN (SELECT DISTINCT t2.b FROM t2 WHERE t2.b = t1.a);
```

  (Bug #42037)
- Some queries using `NAME_CONST(.. COLLATE ...)` [1042] led to a server crash due to a failed type cast. (Bug #42014)
- On the IBM i5 platform, the MySQL configuration process caused the system version of `pthread_setschedprio()` to be used. This function returns `SIGILL` on i5 because it is not supported, causing the server to crash. Now the `my_pthread_setprio()` function in the `mysys` library is used instead. (Bug #42524)

- A `'%'` character in SQL statements could cause the server to crash. (Bug #42634)
- The server cannot execute `INSERT DELAYED` statements when statement-based binary logging is enabled, but the error message displayed only the table name, not the entire statement. (Bug #41121)
- `SELECT` statements could be blocked by `INSERT DELAYED` statements that were waiting for a lock, even with `low_priority_updates` [491] enabled. (Bug #40536)
- `FULLTEXT` indexes did not work for Unicode columns that used a custom UCA collation. (Bug #41084)
- On Mac OS X, some of the universal client libraries were not actually universal and were missing code for one or more architectures. (Bug #41940)
- An optimization introduced for Bug #37553 required an explicit cast to be added for some uses of `TIMEDIFF()` [993] because automatic casting could produce incorrect results. (It was necessary to use `TIME(TIMEDIFF(...))` [993].) (Bug #42525)
- Setting `innodb_locks_unsafe_for_binlog` [1372] should be equivalent to setting the transaction isolation level to `READ COMMITTED` [1224]. However, if both of those things were done, nonmatching semi-consistently read rows were not unlocked when they should have been. (Bug #41671)
- String reallocation could cause memory overruns. (Bug #41868)
- For comparison of `NULL` to a subquery result inside `IS NULL`, the comparison could evaluate to `NULL` rather than to `TRUE` or `FALSE`. This occurred for expressions such as:

  ```
  SELECT ... WHERE NULL IN (SELECT ...) IS NULL
  ```

  (Bug #37822)
- Changing `innodb_thread_concurrency` [1383] at runtime could cause errors. (Bug #40760)
- For `InnoDB` tables that used `ROW_FORMAT=REDUNDANT`, storage size of `NULL` columns could be determined incorrectly. (Bug #40369)
- With row-based binary logging, replication of `InnoDB` tables containing `NULL`-valued `BIT` columns could fail. (Bug #39648)
- The `innodb_stats_on_metadata` [1381] system variable was not displayed by `SHOW VARIABLES` and was not settable at runtime. (Bug #38189)
- The use by `libedit` of the `__weak_reference()` macro caused compilation failure on FreeBSD. (Bug #42817)
- `mysql_install_db` did not pass some relevant options to `mysqld`. (Bug #41828)
- The embedded server truncated some error messages. (Bug #37995)
- Attempts to open a valid `MERGE` table sometimes resulted in a `ER_WRONG_MRG_TABLE` [3967] error. This happened after failure to open an invalid `MERGE` table had also generated an `ER_WRONG_MRG_TABLE` [3967] error. (Bug #32047)
- `libmysqld` was not built with all character sets. (Bug #32831)
- The query cache stored packets containing the server status of the time when the cached statement was run. This might lead to an incorrect transaction status on the client side if a statement was cached during a transaction and later served outside a transaction context (or vice versa). (Bug #36326)
- The `mysql` client sometimes improperly interpreted string escape sequences in nonstring contexts. (Bug #36391)

- If the system time was adjusted backward during query execution, the apparent execution time could be negative. But in some cases these queries would be written to the slow query log, with the negative execution time written as a large unsigned number. Now statements with apparent negative execution time are not written to the slow query log. (Bug #35396)
- For `mysqld_multi`, using the `--mysqld=mysqld_safe` [247] option caused the `--defaults-file` [246] and `--defaults-extra-file` [246] options to behave the same way. (Bug #32136)
- For Solaris package installation using `pkgadd`, the postinstall script failed, causing the system tables in the `mysql` database not to be created. (Bug #31164)
- If the default database was dropped, the value of `character_set_database` [465] was not reset to `character_set_server` [465] as it should have been. (Bug #27208)

  References: See also Bug #63524.

Changes in MySQL Enterprise 5.1.31sp1 [QSP] (2009-03-19)

This is a *Service Pack* release of the MySQL Enterprise Server 5.1.

This section documents all changes and bugfixes that have been applied since the last MySQL Enterprise Server release (5.1.31).

If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see http://www.mysql.com/products/enterprise/advisors.html.

Functionality Added or Changed

- The `libedit` library was upgraded to version 2.11. (Bug #42433)

Bugs Fixed

- **Security Fix**: Using an XPath expression employing a scalar expression as a FilterExpr with `ExtractValue()` [1016] or `UpdateXML()` [1018] caused the server to crash. Such expressions now cause an error instead. (Bug #42495)
- The SSL certificates included with MySQL distributions were regenerated because the previous ones had expired. (Bug #42366)
- User variables within triggers could cause a crash if the `mysql_change_user()` C API function was invoked. (Bug #42188)
- Some queries using `NAME_CONST(.. COLLATE ...)` [1042] led to a server crash due to a failed type cast. (Bug #42014)
- On the IBM i5 platform, the MySQL configuration process caused the system version of `pthread_setschedprio()` to be used. This function returns `SIGILL` on i5 because it is not supported, causing the server to crash. Now the `my_pthread_setprio()` function in the `mysys` library is used instead. (Bug #42524)

Changes in MySQL 5.1.31 (2009-01-19)

Functionality Added or Changed

- Performance of `SELECT *` retrievals from `INFORMATION_SCHEMA.COLUMNS` was improved slightly. (Bug #38918)
- Previously, index hints did not work for `FULLTEXT` searches. Now they work as follows:

  For natural language mode searches, index hints are silently ignored. For example, `IGNORE INDEX(i)` is ignored with no warning and the index is still used.

For boolean mode searches, index hints with `FOR ORDER BY` or `FOR GROUP BY` are silently ignored. Index hints with `FOR JOIN` or no `FOR` modifier are honored. In contrast to how hints apply for non-`FULLTEXT` searches, the hint is used for all phases of query execution (finding rows and retrieval, grouping, and ordering). This is true even if the hint is given for a non-`FULLTEXT` index. (Bug #38842)

- A new status variable, `Queries` [567], indicates the number of statements executed by the server. This includes statements executed within stored programs, unlike the `Questions` [567] variable which includes only statements sent to the server by clients. (Bug #41131)

- `MySQL-shared-compat-advanced-gpl-5.1.31-0.*.rpm` and `MySQL-shared-compat-advanced-5.1.31-0.*.rpm` packages are now available. These client library compatibility packages are like the `MySQL-shared-compat` package, but are for the “MySQL Enterprise Server — Advanced Edition” products. Install these packages rather than the normal `MySQL-shared-compat` package if you want to included shared client libraries for older MySQL versions. (Bug #41838)

Bugs Fixed

- **Performance**: For an `InnoDB` table, `DROP TABLE` or `ALTER TABLE ... DISCARD TABLESPACE` could take a long time or cause a server crash. (Bug #39939)

- **Important Change**: **Replication**: If a trigger was defined on an `InnoDB` table and this trigger updated a nontransactional table, changes performed on the `InnoDB` table were replicated and were visible on the slave before they were committed on the master, and were not rolled back on the slave after a successful rollback of those changes on the master.

  As a result of the fix for this issue, the semantics of mixing nontransactional and transactional tables in a transaction have changed. Previously, if the initial statements in a transaction contained nontransactional changes, those statements were written directly to the binary log. Now, any statement appearing after a `BEGIN` (or immediately following a `COMMIT` if `autocommit` [461] = 0) is always considered part of the transaction and cached. This means that nontransactional changes do not propagate to the slave until the transaction is committed and thus written to the binary log.

  See Replication and Transactions, for more information about this change in behavior. (Bug #40116)

- **Important Change**: The MSI installer packages for Windows are now digitally signed with a certificate, enabling installation on Windows where only certified packages are permitted by group policy or configuration.

  As part of this change, and to comply with the certified installer requirements, the `Setup.exe` versions of the MySQL installer have been discontinued. You must have Windows Installer support in your Windows installation to use the MSI install package. This is a standard component on Windows XP SP2 and higher. For earlier versions, you can download the Microsoft Installer support from Microsoft.com. (Bug #36409)

- **Partitioning**: **Replication**: Changing the transaction isolation level while replicating partitioned `InnoDB` tables could cause statement-based logging to fail. (Bug #39084)

- **Partitioning**: A query that timed out when run against a partitioned table failed silently, without providing any warnings or errors, rather than returning `Lock wait timeout exceeded`. (Bug #40515)

- **Partitioning**: `ALTER TABLE ... REORGANIZE PARTITION` could crash the server when the number of partitions was not changed. (Bug #40389)

  References: See also Bug #41945.

- **Partitioning**: A comparison with an invalid `DATE` value in a query against a partitioned table could lead to a crash of the MySQL server.

Note

Invalid `DATE` and `DATETIME` values referenced in the `WHERE` clause of a query on a partitioned table are treated as `NULL`. See Partition Pruning, for more information.

(Bug #40972)

- **Partitioning**: A query on a user-partitioned table caused MySQL to crash, where the query had the following characteristics:
  - The query's `WHERE` clause referenced an indexed column that was also in the partitioning key.
  - The query's `WHERE` clause included a value found in the partition.
  - The query's `WHERE` clause used the `<` or `<>` operators to compare with the indexed column's value with a constant.
  - The query used an `ORDER BY` clause, and the same indexed column was used in the `ORDER BY` clause.
  - The `ORDER BY` clause used an explicit or implicit `ASC` sort priority.

  Two examples of such a query are given here, where `a` represents an indexed column used in the table's partitioning key:

  1. `SELECT * FROM table WHERE a < constant ORDER BY a;`
  2. `SELECT * FROM table WHERE a <> constant ORDER BY a;`

  This bug was introduced in MySQL 5.1.29. (Bug #40954)

  References: This bug was introduced by Bug #30573, Bug #33257, Bug #33555.

- **Partitioning**: For a partitioned table having an `AUTO_INCREMENT` column: If the first statement following a start of the server or a `FLUSH TABLES` statement was an `UPDATE` statement, the `AUTO_INCREMENT` column was not incremented correctly. (Bug #40176)

- **Partitioning**: When executing an `ORDER BY` query on a partitioned `InnoDB` table using an index that was not in the partition expression, the results were sorted on a per-partition basis rather than for the table as a whole. (Bug #37721)

- **Partitioning**: The server attempted to execute the statements `ALTER TABLE ... ANALYZE PARTITION`, `ALTER TABLE ... CHECK PARTITION`, `ALTER TABLE ... OPTIMIZE PARTITION`, and `ALTER TABLE ... REORGANIZE PARTITION` on tables that were not partitioned. (Bug #39434)

  References: See also Bug #20129.

- **Partitioning**: Dropping or creating an index on a partitioned table managed by the `InnoDB` Plugin locked the table. (Bug #37453)

- **Partitioning**: The value of the `CREATE_COLUMNS` column in `INFORMATION_SCHEMA.TABLES` was not `partitioned` for partitioned tables. (Bug #38909)

- **Partitioning**: With `READ COMMITTED` [1224] transaction isolation level, `InnoDB` uses a semi-consistent read that releases nonmatching rows after MySQL has evaluated the `WHERE` clause. However, this was not happening if the table used partitions. (Bug #40595)

- **Partitioning**: `SHOW TABLE STATUS` could show a nonzero value for the `Mean record length` of a partitioned `InnoDB` table, even if the table contained no rows. (Bug #36312)

- **Partitioning**: Partitioned table checking sometimes returned a warning with an error code of 0, making proper response to errors impossible. The fix also renders the error message subject to translation in non-English deployments. (Bug #36768)
- **Partitioning**: When `SHOW CREATE TABLE` was used on a partitioned table, all of the table's `PARTITION` and `SUBPARTITION` clauses were output on a single line, making it difficult to read or parse. (Bug #14326)
- **Replication**: Some `log_event` types did not skip the post-header when reading. (Bug #41961)
- **Replication**: Attempting to read a binary log containing an `Incident_log_event` having an invalid incident number could cause the debug server to crash. (Bug #40482)
- **Replication**: Per-table `AUTO_INCREMENT` option values were not replicated correctly for `InnoDB` tables. (Bug #41986)
- **Replication**: When using row-based replication, an update of a primary key that was rolled back on the master due to a duplicate key error was not rolled back on the slave. (Bug #40221)
- **Replication**: When rotating relay log files, the slave deletes relay log files and then edits the relay log index file. Formerly, if the slave shut down unexpectedly between these two events, the relay log index file could then reference relay logs that no longer existed. Depending on the circumstances, this could when restarting the slave cause either a race condition or the failure of replication. (Bug #38826, Bug #39325)
- **Replication**: With row-based replication, `UPDATE` and `DELETE` statements using `LIMIT` and a table's primary key could produce different results on the master and slave. (Bug #38230)
- The server crashed if an integer field in a CSV file did not have delimiting quotation marks. (Bug #39616)
- Building MySQL on FreeBSD would result in a failure during the `gen_lex_hash` phase of the build. (Bug #38364)
- When a repair operation was carried out on a `CSV` table, the debug server crashed. (Bug #41441)
- The `ExtractValue()` function did not work correctly with XML documents containing a `DOCTYPE` declaration. (Bug #38227)
- Support for the `revision` field in `.frm` files has been removed. This addresses the downgrading problem introduced by the fix for Bug #17823. (Bug #40021)
- `mc.exe` is no longer needed to compile MySQL on Windows. This makes it possible to build MySQL from source using Visual Studio Express 2008. (Bug #40280)
- The server could crash during a sort-order optimization of a dependent subquery. (Bug #39844)
- The server returned a column type of `VARBINARY` rather than `DATE` as the result from the `COALESCE()` [941], `IFNULL()` [947], `IF()` [947], `GREATEST()` [942], or `LEAST()` [943] functions or `CASE` [946] expression if the result was obtained using `filesort` in an anonymous temporary table during the query execution. (Bug #39283)
- If delayed insert failed to upgrade the lock, it did not free the temporary memory storage used to keep newly constructed `BLOB` values in memory, resulting in a memory leak. (Bug #38693)
- On a 32-bit server built without big tables support, the offset argument in a `LIMIT` clause might be truncated due to a 64-bit to 32-bit cast. (Bug #37075)
- A `SELECT` with a `NULL NOT IN` condition containing a complex subquery from the same table as in the outer select caused an assertion failure. (Bug #37894)
- `SHOW PROCESSLIST` displayed “copy to tmp table” when no such copy was occurring. (Bug #37550)

- Queries with a `HAVING` clause could return a spurious row. (Bug #38072)
- Renaming an `ARCHIVE` table to the same name with different lettercase and then selecting from it could cause a server crash. (Bug #37719)
- Use of an uninitialized constant in `EXPLAIN` evaluation caused an assertion failure. (Bug #37870)
- The Event Scheduler no longer logs “started in thread” or “executed” successfully messages to the error log. (Bug #38066)
- On Solaris, a scheduling policy applied to the main server process could be unintentionally overwritten in client-servicing threads. (Bug #38477)
- The fast mutex implementation was subject to excessive lock contention. (Bug #38941)
- Use of the `PACK_KEYS` or `MAX_ROWS` table option in `ALTER TABLE` should have triggered table reconstruction but did not. (Bug #39372)
- With binary logging enabled `CREATE VIEW` was subject to possible buffer overwrite and a server crash. (Bug #39040)
- When built with Valgrind, the server failed to access tables created with the `DATA DIRECTORY` or `INDEX DIRECTORY` table option. (Bug #39102)
- Use of `InnoDB` monitoring (`SHOW ENGINE INNODB STATUS` or one of the `InnoDB` Monitor tables) could cause a server crash due to invalid access to a shared variable in a concurrent environment. (Bug #38883)
- Creating a table with a comment of 62 characters or longer caused a server crash. (Bug #39591)
- Statements that displayed the value of system variables (for example, `SHOW VARIABLES`) expect variable values to be encoded in `character_set_system` [466]. However, variables set from the command line such as `basedir` [463] or `datadir` [468] were encoded using `character_set_filesystem` [465] and not converted correctly. (Bug #37339)
- `CHECK TABLE` failed for `MyISAM` `INFORMATION_SCHEMA` tables. (Bug #39541)
- With the `ONLY_FULL_GROUP_BY` [575] SQL mode enabled, the check for nonaggregated columns in queries with aggregate functions, but without a `GROUP BY` clause was treating all the parts of the query as if they were in the select list. This is fixed by ignoring the nonaggregated columns in the `WHERE` clause. (Bug #39656)
- Prepared statements permitted invalid dates to be inserted when the `ALLOW_INVALID_DATES` [572] SQL mode was not enabled. (Bug #40365)
- `TIMEDIFF()` [993] was erroneously treated as always returning a positive result. Also, `CAST()` [1012] of `TIME` values to `DECIMAL` dropped the sign of negative values. (Bug #37553)

  References: See also Bug #42525.
- `mysqlcheck` used `SHOW FULL TABLES` to get the list of tables in a database. For some problems, such as an empty `.frm` file for a table, this would fail and `mysqlcheck` then would neglect to check other tables in the database. (Bug #37527)
- Updating a view with a subquery in the `CHECK` option could cause an assertion failure. (Bug #37460)
- `CREATE INDEX` could crash with `InnoDB` plugin 1.0.1. (Bug #37284)
- On Windows, the embedded server would crash in `mysql_library_init()` if the language file was missing. (Bug #38293)
- On Windows, a five-second delay occurred at shutdown of applications that used the embedded server. (Bug #38522)

- Accessing user variables within triggers could cause a server crash. (Bug #40770)
- For single-table `UPDATE` statements, an assertion failure resulted from a runtime error in a stored function (such as a recursive function call or an attempt to update the same table as in the `UPDATE` statement). (Bug #40745)
- A server built using yaSSL for SSL support would crash if configured to use an RSA key and a client sent a cipher list containing a non-RSA key as acceptable. (Bug #39178)
- Retrieval speed from the following `INFORMATION_SCHEMA` tables was improved by shortening the `VARIABLE_VALUE` column to 1024 characters: `GLOBAL_VARIABLES`, `SESSION_VARIABLES`, `GLOBAL_STATUS`, and `SESSION_STATUS`.

  As a result of this change, any variable value longer than 1024 characters will be truncated with a warning. This affects only the `init_connect` [481] system variable. (Bug #39955)
- If the operating system is configured to return leap seconds from OS time calls or if the MySQL server uses a time zone definition that has leap seconds, functions such as `NOW()` [990] could return a value having a time part that ends with `:59:60` or `:59:61`. If such values are inserted into a table, they would be dumped as is by `mysqldump` but considered invalid when reloaded, leading to backup/restore problems.

  Now leap second values are returned with a time part that ends with `:59:59`. This means that a function such as `NOW()` [990] can return the same value for two or three consecutive seconds during the leap second. It remains true that literal temporal values having a time part that ends with `:59:60` or `:59:61` are considered invalid.

  For additional details about leap-second handling, see Time Zone Leap Second Support. (Bug #39920)
- On 64-bit Windows systems, the server accepted `key_buffer_size` [483] values larger than 4GB, but allocated less. (For example, specifying a value of 5GB resulted in 1GB being allocated.) (Bug #39494)
- `SET PASSWORD` caused a server crash if the account name was given as `CURRENT_USER()` [1033]. (Bug #41456)
- The `INFORMATION_SCHEMA.SCHEMA_PRIVILEGES` table was limited to 7680 rows. (Bug #41079)
- In debug builds, obsolete debug code could be used to crash the server. (Bug #41041)
- Certain `SELECT` queries could fail with a `Duplicate entry` error. (Bug #40953)
- Use of spatial data types in prepared statements could cause memory leaks or server crashes. (Bug #37956, Bug #37671)
- The `MONTHNAME()` [989] and `DAYNAME()` [986] functions returned a binary string, so that using `LOWER()` [954] or `UPPER()` [959] had no effect. Now `MONTHNAME()` [989] and `DAYNAME()` [986] return a value in `character_set_connection` [464] character set. (Bug #37575)
- Some queries that used a “range checked for each record” scan could return incorrect results. (Bug #40974)

  References: See also Bug #44810.
- `IF(..., CAST(longtext_val AS UNSIGNED), signed_val)` as an argument to an aggregate function could cause an assertion failure. (Bug #40761)
- Certain boolean-mode `FULLTEXT` searches that used the truncation operator did not return matching records and calculated relevance incorrectly. (Bug #37245)
- In example option files provided in MySQL distributions, the `thread_stack` [532] value was increased from 64K to 128K. (Bug #41577)

- `TRUNCATE TABLE` for an `InnoDB` table did not flush cached queries for the table. (Bug #40386)
- `resolve_stack_dump` was unable to resolve the stack trace format produced by `mysqld` in MySQL 5.1 and up (see Using a Stack Trace). (Bug #41612)
- The optimizer could ignore an error and rollback request during a filesort, causing an assertion failure. (Bug #41543)
- `DATE_FORMAT()` [985] could cause a server crash for year-zero dates. (Bug #41470)
- When substituting system constant functions with a constant result, the server was not expecting `NULL` function return values and could crash. (Bug #41437)
- The `do_abi_check` program run during the build process depends on `mysql_version.h` but that file was not created first, resulting in build failure. (Bug #39571)
- Queries such as `SELECT ... CASE AVG(...) WHEN ...` that used aggregate functions in a `CASE` [946] expression crashed the server. (Bug #41363)
- `INSERT INTO .. SELECT ... FROM` and `CREATE TABLE ... SELECT ... FROM` a TEMPORARY table could inadvertently change the locking type of the temporary table from a write lock to a read lock, causing statement failure. (Bug #41348)
- The `':'` character was incorrectly not permitted in table names. (Bug #40104)
- For debug servers, `OPTIMIZE TABLE` on a compressed table caused a server crash. (Bug #40949)
- For a server started with the `--temp-pool` [446] option on Windows, temporary file creation could fail. This option now is ignored except on Linux systems, which was its original intended scope. (Bug #39750)
- `ALTER TABLE` on a table with `FULLTEXT` index that used a pluggable `FULLTEXT` parser could cause debug servers to crash. (Bug #39746)
- An error in a debugging check caused crashes in debug servers. (Bug #37936)
- For an `InnoDB` table with a `FOREIGN KEY` constraint, `TRUNCATE TABLE` may be performed using row by row deletion. If an error occurred during this deletion, the table would be only partially emptied. Now if an error occurs, the truncation operation is rolled back and the table is left unchanged. (Bug #37016)
- Primary keys were treated as part of a covering index even if only a prefix of a key column was used. (Bug #37742)
- `InnoDB` could fail to generate `AUTO_INCREMENT` values after an `UPDATE` statement for the table. (Bug #38839)
- A mix of `TRUNCATE TABLE` with `LOCK TABLES` and `UNLOCK TABLES` for an `InnoDB` could cause a server crash. (Bug #38231)
- The presence of a `/* ... */` comment preceding a query could cause `InnoDB` to use unnecessary gap locks. (Bug #37885)
- `InnoDB` could hang trying to open an adaptive hash index. (Bug #39483)
- Following `ALTER TABLE ... DISCARD TABLESPACE` for an `InnoDB` table, an attempt to determine the free space for the table before the `ALTER TABLE` operation had completely finished could cause a server crash. (Bug #39438)
- When using `ALTER TABLE` on an `InnoDB` table, the `AUTO_INCREMENT` value could be changed to an incorrect value. (Bug #37788)
- Server variables could not be set to their current values on Linux platforms. (Bug #31177)

References: See also Bug #6958.

- `InnoDB` was not updating the `Handler_delete` [561] or `Handler_update` [562] status variables. (Bug #35537)
- `CREATE INDEX` for `InnoDB` tables could under very rare circumstances cause the server to crash.. (Bug #36169)
- The `mysql` client incorrectly parsed statements containing the word “delimiter” in mid-statement.

  This fix is different from the one applied for this bug in MySQL 5.1.26. (Bug #33812)

  References: See also Bug #38158.
- A read past the end of the string could occur while parsing the value of the `--innodb-data-file-path` [1364] option. (Bug #36149)
- The code for the `ut_usectime()` function in `InnoDB` did not handle errors from the `gettimeofday()` system call. Now it retries `gettimeofday()` several times and updates the value of the `Innodb_row_lock_time_max` [565] status variable only if `ut_usectime()` was successful. (Bug #36819)
- Execution of a prepared statement that referred to a system variable caused a server crash. (Bug #32124)
- For a stored procedure containing a `SELECT * ... RIGHT JOIN` query, execution failed for the second call. (Bug #33811)
- `mysqldumpslow` did not aggregate times. (Bug #34129)
- `EXPLAIN EXTENDED` evaluation of aggregate functions that required a temporary table caused a server crash. (Bug #34773)
- Selecting from an `INFORMATION_SCHEMA` table into an incorrectly defined `MERGE` table caused an assertion failure. (Bug #35068)
- Some `SHOW` statements and retrievals from the `INFORMATION_SCHEMA` `TRIGGERS` and `EVENTS` tables used a temporary table and incremented the `Created_tmp_disk_tables` [560] status variable, due to the way that `TEXT` columns are handled. The `TRIGGERS.SQL_MODE`, `TRIGGERS.DEFINER`, and `EVENTS.SQL_MODE` columns now are `VARCHAR` to avoid this problem. (Bug #29153)
- The `mysql` client, when built with Visual Studio 2005, did not display Japanese characters. (Bug #36279)
- `perror` on Windows did not know about Win32 system error codes. (Bug #34825)
- Use of `CONVERT()` [1012] with `GROUP BY` to convert numeric values to `CHAR` could return truncated results. (Bug #36772)
- Previously, use of index hints with views (which do not have indexes) produced the error `ERROR 1221 (HY000): Incorrect usage of USE/IGNORE INDEX and VIEW`. Now this produces `ERROR 1176 (HY000): Key '...' doesn't exist in table '...'`, the same error as for base tables without an appropriate index. (Bug #33461)
- Some division operations produced a result with incorrect precision. (Bug #31616)
- `mysql_config` did not output `-ldl` (or equivalent) when needed for `--libmysqld-libs` [383], so its output could be insufficient to build applications that use the embedded server. (Bug #34025)
- `SHOW GLOBAL STATUS` shows values that aggregate the session status values for all threads. This did not work correctly for the embedded server. (Bug #34517)

- Setting the `slave_compressed_protocol` [1644] system variable to `DEFAULT` failed in the embedded server. (Bug #35999)
- The columns that store character set and collation names in several `INFORMATION_SCHEMA` tables were lengthened because they were not long enough to store some possible values: `SCHEMATA`, `TABLES`, `COLUMNS`, `CHARACTER_SETS`, `COLLATIONS`, and `COLLATION_CHARACTER_SET_APPLICABILITY`. (Bug #35789)
- `ALTER TABLE CONVERT TO CHARACTER SET` did not convert `TINYTEXT` or `MEDIUMTEXT` columns to a longer text type if necessary when converting the column to a different character set. (Bug #31291)
- The `max_length` metadata value was calculated incorrectly for the `FORMAT()` [952] function, which could cause incorrect result set metadata to be sent to clients. (Bug #35558)
- `SHOW CREATE TABLE` did not display a printable value for the default value of `BIT` columns. (Bug #35796)
- Queries executed using join buffering of `BIT` columns could produce incorrect results. (Bug #31399)
- Three conditions were discovered that could cause an upgrade from MySQL 5.0 to 5.1 to fail: 1) Triggers associated with a table that had a `#mysql50#` prefix in the name could cause assertion failure. 2) `ALTER DATABASE ... UPGRADE DATA DIRECTORY NAME` failed for databases that had a `#mysql50#` prefix if there were triggers in the database. 3) `mysqlcheck --fix-table-name` did not use `utf8` as the default character set, resulting in parsing errors for tables with nonlatin symbols in their names and trigger definitions. (Bug #33094, Bug #41385)
- The `CREATE_OPTIONS` column for `INFORMATION_SCHEMA.TABLES` did not display the `KEY_BLOCK_SIZE` option. (Bug #35275)
- Static storage engines and plugins that were disabled and dynamic plugins that were installed but disabled were not listed in the `INFORMATION_SCHEMA` appropriate `PLUGINS` or `ENGINES` table. (Bug #29263)
- For upgrades to MySQL 5.1 or higher, `mysql_upgrade` did not re-encode database or table names that contained nonalphanumeric characters. (They would still appear after the upgrade with the `#mysql50#` prefix described in Mapping of Identifiers to File Names.) To correct this problem, it was necessary to run `mysqlcheck --all-databases --check-upgrade --fix-db-names --fix-table-names` manually. `mysql_upgrade` now runs that command automatically after performing the initial upgrade. (Bug #35934)
- `InnoDB` could fail to generate `AUTO_INCREMENT` values if rows previously had been inserted containing literal values for the `AUTO_INCREMENT` column. (Bug #35498, Bug #36411, Bug #39830)
- For installation on Solaris using `pkgadd` packages, the `mysql_install_db` script was generated in the `scripts` directory, but the temporary files used during the process were left there and not deleted. (Bug #31052)
- The `Questions` [567] status variable is intended as a count of statements sent by clients to the server, but was also counting statements executed within stored routines. (Bug #24289)
- For several read only system variables that were viewable with `SHOW VARIABLES`, attempting to view them with `SELECT @@var_name` or set their values with `SET` resulted in an `unknown system variable` error. Now they can be viewed with `SELECT @@var_name` and attempting to set their values results in a message indicating that they are read only. (Bug #28234)
- Setting the session value of the `max_allowed_packet` [493] or `net_buffer_length` [505] system variable was permitted but had no effect. The session value of these variables is now read only. (Bug #22891)

  References: See also Bug #32223.
- SSL support was not included in some “generic” RPM packages. (Bug #26760)

- On Windows, Visual Studio does not take into account some x86 hardware limitations, which led to incorrect results converting large `DOUBLE` values to unsigned `BIGINT` values. (Bug #27483)
- A race condition between the `mysqld.exe` server and the Windows service manager could lead to inability to stop the server from the service manager. (Bug #20430)
- On Windows, moving an `InnoDB .ibd` file and then symlinking to it in the database directory using a `.sym` file caused a server crash. (Bug #11894)

Changes in MySQL 5.1.30 (2008-11-14, General Availability)

Bugs Fixed

- **Partitioning**: A `SELECT` using a range `WHERE` condition with an `ORDER BY` on a partitioned table caused a server crash. (Bug #40494)
- **Replication**: Executing `SHOW BINLOG EVENTS` increased the value of `max_allowed_packet` [493] applying to the session that executed the statement. (Bug #55322)
- **Replication**: Row-based replication failed with nonpartitioned `MyISAM` tables having no indexes. (Bug #40004)
- Some recent releases for Solaris 10 were built on Solaris 10 U5, which included a new version of `libnsl.so` that does not work on U4 or earlier. To correct this, Solaris 10 builds now are created on machines that do not have that upgraded `libnsl.so`, so that they will work on Solaris 10 installations both with and without the upgraded `libnsl.so`. (Bug #39074)
- With statement-based binary logging format and a transaction isolation level of `READ COMMITTED` [1224] or stricter, `InnoDB` printed an error because statement-based logging might lead to inconsistency between master and slave databases. However, this error was printed even when binary logging was not enabled (in which case, no such inconsistency can occur). (Bug #40360)
- The `CHECK TABLE ... FOR UPGRADE` statement did not check for incompatible collation changes made in MySQL 5.1.24 (Bug #27877). This also affects `mysqlcheck` and `mysql_upgrade`, which cause that statement to be executed. See Checking Whether Tables or Indexes Must Be Rebuilt.

  Prior to this fix, a binary upgrade (performed without dumping tables with `mysqldump` before the upgrade and reloading the dump file after the upgrade) would corrupt tables that have indexes that use the `utf8_general_ci` or `ucs2_general_ci` collation for columns that contain `'ß'` LATIN SMALL LETTER SHARP S (German). After the fix, `CHECK TABLE ... FOR UPGRADE` properly detects the problem and warns about tables that need repair.

  However, the fix is not backward compatible and can result in a downgrading problem under these circumstances:

  1. Perform a binary upgrade to a version of MySQL that includes the fix.
  2. Run `CHECK TABLE ... FOR UPGRADE` (or `mysqlcheck` or `mysql_upgrade`) to upgrade tables.
  3. Perform a binary downgrade to a version of MySQL that does not include the fix.

  The solution is to dump tables with `mysqldump` before the downgrade and reload the dump file after the downgrade. Alternatively, drop and recreate affected indexes. (Bug #40053)
- With binary logging enabled, `CREATE TABLE ... SELECT` and `INSERT INTO ... SELECT` failed if the source table was a log table. (Bug #34306)
- XA transaction rollbacks could result in corrupted transaction states and a server crash. (Bug #28323)
- `ALTER TABLE` for an `ENUM` column could change column values. (Bug #23113)

Changes in MySQL 5.1.29 (2008-10-11)

Functionality Added or Changed

- **Important Change**: The `--skip-thread-priority` option is now deprecated such that the server will not change the thread priorities by default. Giving threads different priorities might yield marginal improvements in some platforms (where it actually works), but it might instead cause significant degradation depending on the thread count and number of processors. Meddling with the thread priorities is a not a safe bet as it is very dependent on the behavior of the CPU scheduler and system where MySQL is being run. (Bug #35164, Bug #37536)

- **Important Change**: The `--log` [430] option now is deprecated and will be removed (along with the `log` system variable) in the future. Instead, use the `--general_log` [477] option to enable the general query log and the `--general_log_file=`*`file_name`* [478] option to set the general query log file name. The values of these options are available in the `general_log` [477] and `general_log_file` [478] system variables, which can be changed at runtime.

  Similar changes were made for the `--log-slow-queries` [433] option and `log_slow_queries` [490] system variable. You should use the `--slow_query_log` [522] and `--slow_query_log_file=`*`file_name`* [523] options instead (and the `slow_query_log` [522] and `slow_query_log_file` [523] system variables).

- The `BUILD/compile-solaris-*` scripts now compile MySQL with the `mtmalloc` library rather than `malloc`. (Bug #38727)

Bugs Fixed

- **Incompatible Change**: **Replication**: The default binary logging mode has been changed from `MIXED` to `STATEMENT` for compatibility with MySQL 5.0. (Bug #39812)

- **Incompatible Change**: `CHECK TABLE ... FOR UPGRADE` did not check for incompatible collation changes made in MySQL 5.1.21 (Bug #29499) and 5.1.23 (Bug #27562, Bug #29461). This also affects `mysqlcheck` and `mysql_upgrade`, which cause that statement to be executed. See Checking Whether Tables or Indexes Must Be Rebuilt. (Bug #39585)

  References: See also Bug #40984.

- **Incompatible Change**: In connection with view creation, the server created `arc` directories inside database directories and maintained useless copies of `.frm` files there. Creation and renaming procedures of those copies as well as creation of `arc` directories has been discontinued.

  This change does cause a problem when downgrading to older server versions which manifests itself under these circumstances:

  1. Create a view `v_orig` in MySQL 5.1.29 or higher.
  2. Rename the view to `v_new` and then back to `v_orig`.
  3. Downgrade to an older 5.1.x server and run `mysql_upgrade`.
  4. Try to rename `v_orig` to `v_new` again. This operation fails.

  As a workaround to avoid this problem, use either of these approaches:

  - Dump your data using `mysqldump` before downgrading and reload the dump file after downgrading.
  - Instead of renaming a view after the downgrade, drop it and recreate it.

  The downgrade problem introduced by the fix for this bug has been addressed as Bug #40021. (Bug #17823)

- **Important Change**: **Replication**: The `SUPER` [628] privilege is now required to change the session value of `binlog_format` [1654] as well as its global value. For more information about `binlog_format` [1654], see Replication Formats. (Bug #39106)
- **Partitioning**: **Replication**: Replication to partitioned `MyISAM` tables could be slow with row-based binary logging. (Bug #35843)
- **Partitioning**: Using `INSERT ... SELECT` to insert records into a partitioned `MyISAM` table could fail if some partitions were empty and others are not. (Bug #38005)
- **Partitioning**: If an error occurred when evaluating a column of a partitioned table for the partitioning function, the row could be inserted anyway. (Bug #38083)
- **Partitioning**: Ordered range scans on partitioned tables were not always handled correctly. In some cases this caused some rows to be returned twice. The same issue also caused `GROUP BY` query results to be aggregated incorrectly. (Bug #30573, Bug #33257, Bug #33555)
- **Replication**: Server code used in binary logging could in some cases be invoked even though binary logging was not actually enabled, leading to asserts and other server errors. (Bug #38798)
- **Replication**: In some cases, a replication master sent a special event to a reconnecting slave to keep the slave's temporary tables, but they still had references to the “old” slave SQL thread and used them to access that thread's data. (Bug #38269)
- **Replication**: Replication of `BLACKHOLE` tables did not work with row-based binary logging. (Bug #38360)
- **Replication**: A statement did not always commit or roll back correctly when the server was shut down; the error could be triggered by having a failing `UPDATE` or `INSERT` statement on a transactional table, causing an implicit rollback. (Bug #32709)

  References: See also Bug #38262.
- **Replication**: Replication filtering rules were inappropiately applied when executing `BINLOG` pseudo-queries. One way in which this problem showed itself was that, when replaying a binary log with `mysqlbinlog`, RBR events were sometimes not executed if the `--replicate-do-db` [1634] option was specified. Now replication rules are applied only to those events executed by the slave SQL thread. (Bug #36099)
- **Replication**: For a `CREATE TABLE ... SELECT` statement that creates a table in a database other than the current one, the table could be created in the wrong database on replication slaves if row-based binary logging is used. (Bug #34707)
- The Sun Studio compiler failed to build debug versions of the server due to use of features specific to `gcc`. (Bug #39451)
- The combination of a subquery with a `GROUP BY`, an aggregate function calculated outside the subquery, and a `GROUP BY` on the outer `SELECT` could cause the server to crash. (Bug #37348)
- The `<=>` [939] operator could return incorrect results when comparing `NULL` to `DATE`, `TIME`, or `DATETIME` values. (Bug #37526)
- Access checks were skipped for `SHOW PROCEDURE STATUS` and `SHOW FUNCTION STATUS`, which could lead to a server crash or insufficient access checks in subsequent statements. (Bug #37908)
- When inserting a string into a duplicate-key error message, the server could improperly interpret the string, resulting in a crash. (Bug #38701)
- Queries of the form `SELECT ... REGEXP BINARY NULL` could lead to a hung or crashed server. (Bug #39021)
- Repeated `CREATE TABLE ... SELECT` statements, where the created table contained an `AUTO_INCREMENT` column, could lead to an assertion failure. (Bug #38821)

- Statements of the form `INSERT ... SELECT .. ON DUPLICATE KEY UPDATE col_name = DEFAULT` could result in a server crash. (Bug #39002)
- An uninitialized variable in the query profiling code was corrected (detected by Valgrind). (Bug #38560)
- A server crash resulted from concurrent execution of a multiple-table `UPDATE` that used a `NATURAL` or `USING` join together with `FLUSH TABLES WITH READ LOCK` or `ALTER TABLE` for the table being updated. (Bug #38691)
- Column names constructed due to wild-card expansion done inside a stored procedure could point to freed memory if the expansion was performed after the first call to the stored procedure. (Bug #38823)
- A server crash resulted from execution of an `UPDATE` that used a derived table together with `FLUSH TABLES`. (Bug #38499)
- The handlerton-to-plugin mapping implementation did not free handler plugin references when the plugin was uninstalled, resulting in a server crash after several install/uninstall cycles. Also, on Mac OS X, the server crashed when trying to access an `EXAMPLE` table after the `EXAMPLE` plugin was installed. (Bug #37958)
- For deadlock between two transactions that required a timeout to resolve, all server tables became inaccessible for the duration of the deadlock. (Bug #38804)
- Stored procedures involving substrings could crash the server on certain platforms due to invalid memory reads. (Bug #38469)
- The server crashed if an argument to a stored procedure was a subquery that returned more than one row. (Bug #37949)
- References to local variables in stored procedures are replaced with `NAME_CONST(name, value)` [1042] when written to the binary log. However, an “illegal mix of collation” error might occur when executing the log contents if the value's collation differed from that of the variable. Now information about the variable collation is written as well. (Bug #39182)
- For a `TIMESTAMP` column in an `InnoDB` table, testing the column with multiple conditions in the `WHERE` clause caused a server crash. (Bug #39353)
- The `NO_BACKSLASH_ESCAPES` [573] SQL mode was ignored for `LOAD DATA INFILE` and `SELECT INTO ... OUTFILE`. The setting is taken into account now. (Bug #37114)
- On ActiveState Perl, `mysql-test-run.pl --start-and-exit` started but did not exit. (Bug #38629)
- When analyzing the possible index use cases, the server was incorrectly reusing an internal structure, leading to a server crash. (Bug #37943)
- A race condition between threads sometimes caused unallocated memory to be addressed. (Bug #38692)
- In some cases, references to views were confused with references to anonymous tables and privilege checking was not performed. (Bug #36086)
- Dynamic plugins failed to load on i5/OS. (Bug #35743)
- `mysqldump` could fail to dump views containing a large number of columns. (Bug #31434)
- `ALTER EVENT` changed the `PRESERVE` attribute of an event even when `PRESERVE` was not specified in the statement. (Bug #35981)
- A trigger for an `InnoDB` table activating multiple times could lead to `AUTO_INCREMENT` gaps. (Bug #31612)

- With the PAD_CHAR_TO_FULL_LENGTH [575] SQL mode enabled, a ucs2 CHAR column returned additional garbage after trailing space characters. (Bug #35720)
- mysql_install_db failed on machines that had the host name set to localhost. (Bug #35754)
- For crash reports on Windows, symbol names in stack traces were not correctly resolved. (Bug #35987)
- Host name values in SQL statements were not being checked for '@', which is illegal according to RFC952. (Bug #35924)
- The server could improperly type user-defined variables used in the select list of a query. (Bug #26020)
- For access to the INFORMATION_SCHEMA.VIEWS table, the server did not check the SHOW VIEW [628] and SELECT privileges, leading to inconsistency between output from that table and the SHOW CREATE VIEW statement. (Bug #22763)
- mysqld_safe would sometimes fail to remove the pid file for the old mysql process after a crash. As a result, the server would fail to start due to a false A mysqld process already exists... error. (Bug #11122)

Changes in MySQL 5.1.28 (2008-08-28)

Functionality Added or Changed

- **Important Change**: mysqlbinlog now supports --verbose [354] and --base64-output=DECODE-ROWS [349] options to display row events as commented SQL statements. (The default otherwise is to display row events encoded as base-64 strings using BINLOG statements.) See mysqlbinlog Row Event Display. (Bug #31455)
- Added the SHOW PROFILES and SHOW PROFILE statements to display statement profile data, and the accompanying INFORMATION_SCHEMA.PROFILING table. Profiling is controlled using the profiling [511] and profiling_history_size [511] session variables. see SHOW PROFILES Syntax, and The INFORMATION_SCHEMA PROFILING Table. (Community contribution by Jeremy Cole)

  The profiling feature is enabled using the --enable-community-features [136] and --enable-profiling [136] options to configure. These options are enabled by default; to disable them, use --disable-community-features [136] and --disable-profiling [136]. (Bug #24795)
- MySQL source distributions are now available in Zip format. (Bug #27742)

Bugs Fixed

- **Important Change**: **Security Fix**: Additional corrections were made for the symlink-related privilege problem originally addressed in MySQL 5.1.24. The original fix did not correctly handle the data directory path name if it contained symlinked directories in its path, and the check was made only at table-creation time, not at table-opening time later.

  Note

  Additional fixes were made in MySQL 5.1.41.

  (Bug #32167, CVE-2008-2079)

  References: See also Bug #39277.
- **Security Enhancement**: The server consumed excess memory while parsing statements with hundreds or thousands of nested boolean conditions (such as OR (OR ... (OR ...))). This

could lead to a server crash or incorrect statement execution, or cause other client statements to fail due to lack of memory. The latter result constitutes a denial of service. (Bug #38296)

- **Performance**: **Incompatible Change**: Some performance problems of `SHOW ENGINE INNODB STATUS` were reduced by removing `used cells` and `Total number of lock structs in row lock hash table` from the output. Now these values are present only if the `UNIV_DEBUG` symbol is defined at MySQL build time. (Bug #36941, Bug #36942)

- **Performance**: Over-aggressive lock acquisition by `InnoDB` when calculating free space for tablespaces could result in performance degradation when multiple threads were executing statements on multi-core machines. (Bug #38185)

- **Incompatible Change**: There were some problems using `DllMain()` hook functions on Windows that automatically do global and per-thread initialization for `libmysqld.dll`:

  - Per-thread initialization: MySQL internally counts the number of active threads, which causes a delay in `my_end()` if not all threads have exited. But there are threads that can be started either by Windows internally (often in TCP/IP scenarios) or by users. Those threads do not necessarily use `libmysql.dll` functionality but still contribute to the open-thread count. (One symptom is a five-second delay in times for PHP scripts to finish.)

  - Process-initialization: `my_init()` calls `WSAStartup` that itself loads DLLs and can lead to a deadlock in the Windows loader.

  To correct these problems, DLL initialization code now is not invoked from `libmysql.dll` by default. To obtain the previous behavior (DLL initialization code will be called), set the `LIBMYSQL_DLLINIT` environment variable to any value. This variable exists only to prevent breakage of existing Windows-only applications that do not call `mysql_thread_init()` and work okay today. Use of `LIBMYSQL_DLLINIT` is discouraged and is removed in MySQL 6.0. (Bug #37226, Bug #33031)

- **Incompatible Change**: `SHOW STATUS` took a lot of CPU time for calculating the value of the `Innodb_buffer_pool_pages_latched` [562] status variable. Now this variable is calculated and included in the output of `SHOW STATUS` only if the `UNIV_DEBUG` symbol is defined at MySQL build time. (Bug #36600)

- **Incompatible Change**: An additional correction to the original MySQL 5.1.23 fix was made to normalize directory names before adding them to the list of directories. This prevents `/etc/` and `/etc` from being considered different, for example. (Bug #20748)

  References: See also Bug #38180.

- **Partitioning**: When a partitioned table had a `TIMESTAMP` column defined with `CURRENT_TIMESTAMP` as the default but with no `ON UPDATE` clause, the column's value was incorrectly set to `CURRENT_TIMESTAMP` when updating across partitions. (Bug #38272)

- **Partitioning**: `myisamchk` failed with an assertion error when analyzing a partitioned `MyISAM` table. (Bug #37537)

- **Partitioning**: Attempting to execute an `INSERT DELAYED` statement on a partitioned table produced the error `Table storage engine for 'table' doesn't have this option`, which did not reflect the source of the error accurately. The error message returned in such cases has been changed to `DELAYED option not supported for table 'table'`. (Bug #31210)

- **Partitioning**: A `LIST` partitioned `MyISAM` table returned erroneous results when an index was present on a column in the `WHERE` clause and `NOT IN` was used on that column.

  Searches using the index were also much slower then if the index were not present. (Bug #35931)

- **Partitioning**: `SELECT COUNT(*)` was not correct for some partitioned tables using a storage engine that did not support `HA_STATS_RECORDS_IS_EXACT`. Tables using the `ARCHIVE` storage engine were known to be affected.

This was because `ha_partition::records()` was not implemented, and so the default `handler::records()` was used in its place. However, this is not correct behavior if the storage engine does not support `HA_STATS_RECORDS_IS_EXACT`.

The solution was to implement `ha_partition::records()` as a wrapper around the underlying partition records.

As a result of this fix, the rows column in the output of `EXPLAIN PARTITIONS` now includes the total number of records in the partitioned table. (Bug #35745)

- **Partitioning**: When one user was in the midst of a transaction on a partitioned table, a second user performing an `ALTER TABLE` on this table caused the server to hang. (Bug #34604)
- **Partitioning**: `MyISAM` recovery enabled with the `--myisam-recover` [436] option did not work for partitioned `MyISAM` tables. (Bug #35161)
- **Replication**: Some kinds of internal errors, such as `Out of memory` errors, could cause the server to crash when replicating statements with user variables.

  certain internal errors. (Bug #37150)
- **Replication**: Row-based replication did not correctly copy `TIMESTAMP` values from a big-endian storage engine to a little-endian storage engine. (Bug #37076)
- **Replication**: `INSTALL PLUGIN` and `UNINSTALL PLUGIN` caused row-based replication to fail.

  Note

  These statements are not replicated; however, when using row-based logging, the changes they introduce in the `mysql` system tables are written to the binary log.

  (Bug #35807)
- The fix for Bug #20748 caused a problem such that on Unix, MySQL programs looked for options in `~/my.cnf` rather than the standard location of `~/.my.cnf`. (Bug #38180)
- For `InnoDB` tables, `ORDER BY ... DESC` sometimes returned results in ascending order. (Bug #37830)
- Killing a query that used an `EXISTS` subquery as the argument to `SUM()` [1047] or `AVG()` [1045] caused a server crash. (Bug #37627)
- Setting the session value of the `innodb_table_locks` [1383] system variable caused a server crash. (Bug #37669)
- The server returned unexpected results if a right side of the `NOT IN` clause consisted of the `NULL` value and some constants of the same type. For example, this query might return 3, 4, 5, and so forth if a table contained those values:

  ```
  SELECT * FROM t WHERE NOT t.id IN (NULL, 1, 2);
  ```

  (Bug #37761)
- Server-side cursors were not initialized properly, which could cause a server crash. (Bug #38486)
- Nesting of `IF()` [947] inside of `SUM()` [1047] could cause an extreme server slowdown. (Bug #37662)
- If the table definition cache contained tables with many `BLOB` columns, much memory could be allocated to caching `BLOB` values. Now a size limit on the cached `BLOB` values is enforced. (Bug #38002)

- The `max_length` result set metadata value was calculated incorrectly under some circumstances. (Bug #37301)
- Within stored programs or prepared statements, `REGEXP` [963] could return incorrect results due to improper initialization. (Bug #37337)
- A failure to clean up binary log events was corrected (detected by Valgrind). (Bug #38290)
- A server crash or Valgrind warnings could result when a stored procedure selected from a view that referenced a function. (Bug #38291)
- After `TRUNCATE TABLE` for an `InnoDB` table, inserting explicit values into an `AUTO_INCREMENT` column could fail to increment the counter and result in a duplicate-key error for subsequent insertion of `NULL`. (Bug #37531)
- For a `MyISAM` table with `CHECKSUM = 1` and `ROW_FORMAT = DYNAMIC` table options, a data consistency check (maximum record length) could fail and cause the table to be marked as corrupted. (Bug #37310)
- When using indexed `ORDER BY` sorting, incorrect query results could be produced if the optimizer switched from a covering index to a noncovering index. (Bug #37548)
- Incorrect handling of aggregate functions when loose index scan was used caused a server crash. (Bug #38195)
- If a table has a `BIT NOT NULL` column `c1` with a length shorter than 8 bits and some additional `NOT NULL` columns `c2`, ..., and a `SELECT` query has a `WHERE` clause of the form `(c1 = constant) AND c2 ...`, the query could return an unexpected result set. (Bug #37799)
- Queries containing a subquery with `DISTINCT` and `ORDER BY` could cause a server crash. (Bug #38191)
- The `UUID()` [1042] function returned UUIDs with the wrong time; this was because the offset for the time part in UUIDs was miscalculated. (Bug #35848)
- `mysqlbinlog` left temporary files on the disk after shutdown, leading to the pollution of the temporary directory, which eventually caused `mysqlbinlog` to fail. This caused problems in testing and other situations where `mysqlbinlog` might be invoked many times in a relatively short period of time. (Bug #35543)
- `mysql_install_db` failed if the default storage engine was `NDB`. Now it explicitly uses `MyISAM` as the storage engine when running `mysqld --bootstrap`. (Bug #31315)
- `TRUNCATE TABLE` for `InnoDB` tables returned a count showing too many rows affected. Now the statement returns 0 for `InnoDB` tables. (Bug #29507)
- For `InnoDB` tables, the `DATA_FREE` column of the `INFORMATION_SCHEMA.TABLES` displayed free space in kilobytes rather than bytes. Now it displays bytes. (Bug #36278)
- The `mysql` client failed to recognize comment lines consisting of `--` followed by a newline. (Bug #36244)
- If the length of a field was 3, internal `InnoDB` to integer type conversion didn't work on big-endian machines in the `row_search_autoinc_column()` function. (Bug #36793)
- Freeing of an internal parser stack during parsing of complex stored programs caused a server crash. (Bug #35577, Bug #37269, Bug #37228)
- Index scans performed with the `sort_union()` access method returned wrong results, caused memory to be leaked, and caused temporary files to be deleted when the limit set by `sort_buffer_size` [523] was reached. (Bug #35477, Bug #35478)
- `SELECT DISTINCT` from a simple view on an `InnoDB` table, where all selected columns belong to the same unique index key, returned incorrect results. (Bug #36632)

- Cached queries that used 256 or more tables were not properly cached, so that later query invalidation due to a `TRUNCATE TABLE` for one of the tables caused the server to hang. (Bug #33362)
- The internal functions `my_getsystime()`, `my_micro_time()`, and `my_micro_time_and_time()` did not work correctly on Windows. One symptom was that uniqueness of `UUID()` [1042] values could be compromised. (Bug #33748)
- Fast `ALTER TABLE` operations were not fast for columns that used multi-byte character sets. (Bug #33873)
- For `InnoDB` tables, `REPLACE` statements used “traditional” style locking, regardless of the setting of `innodb_autoinc_lock_mode` [1362]. Now `REPLACE` works the same way as “simple inserts” instead of using the old locking algorithm. (`REPLACE` statements are treated in the same way as `INSERT` statements.) (Bug #35602)
- A significant slowdown occurred when many `SELECT` statements that return many rows from `InnoDB` tables were running concurrently. (Bug #34409)
- `mysql_install_db` failed if the server was running with an SQL mode of `TRADITIONAL` [578]. This program now resets the SQL mode internally to avoid this problem. (Bug #34159)
- The Serbian translation for the `ER_INCORRECT_GLOBAL_LOCAL_VAR` [3972] error was corrected. (Bug #29738)
- `mysql_upgrade` attempted to use the `/proc` file system even on systems that do not have it. (Bug #31605)
- The `configure` script did not permit `utf8_hungarian_ci` to be specified as the default collation. (Bug #35808)
- Several MySQL programs could fail if the `HOME` environment variable had an empty value. (Bug #30394)
- On 64-bit systems, assigning values of $2^{63} - 1$ or larger to `key_buffer_size` [483] caused memory overruns. (Bug #35616)
- The server could crash with an assertion failure (or cause the client to get a “Packets out of order” error) when the expected query result was that it should terminate with a “Subquery returns more than 1 row” error. (Bug #36135)
- Dumping information about locks in use by sending a `SIGHUP` signal to the server or by invoking the `mysqladmin debug` command could lead to a server crash in debug builds or to undefined behavior in production builds. (Bug #36579)
- The `CSV` storage engine returned success even when it failed to open a table's data file. (Bug #36638)
- On NetWare, `mysql_install_db` could appear to execute normally even if it failed to create the initial databases. (Bug #30129)
- When the fractional part in a multiplication of `DECIMAL` values overflowed, the server truncated the first operand rather than the longest. Now the server truncates so as to produce more precise multiplications. (Bug #36270)
- If initialization of an `INFORMATION_SCHEMA` plugin failed, `INSTALL PLUGIN` freed some internal plugin data twice. (Bug #36399)
- Table checksum calculation could cause a server crash for `FEDERATED` tables with `BLOB` columns containing `NULL` values. (Bug #34779)
- Changes to build files were made to enable the MySQL distribution to compile on Microsoft Visual C++ Express 2008. (Bug #33907)

- A query which had an `ORDER BY DESC` clause that is satisfied with a reverse range scan could cause a server crash for some specific CPU/compiler combinations. (Bug #36639)
- In some cases, the parser interpreted the `;` character as the end of input and misinterpreted stored program definitions. (Bug #26030)
- The `FLUSH PRIVILEGES` statement did not produce an error when it failed. (Bug #21226)
- The `BUILD/check-cpu` build script failed if `gcc` had a different name (such as `gcc.real` on Debian). (Bug #27526)
- After executing a prepared statement that accesses a stored function, the next execution would fail to find the function if the stored function cache was flushed in the meantime. (Bug #12093, Bug #21294)

Changes in MySQL 5.1.27 (Not released)

Functionality Added or Changed

- `mysqltest` now installs signal handlers and generates a stack trace if it crashes. (Bug #37003)
- `mysql-test-run.pl` now supports `--client-bindir` and `--client-libdir` options for specifying the directory where client binaries and libraries are located. (Bug #34995)

Bugs Fixed

- **Partitioning**: **Incompatible Change**: On Mac OS X, with `lower_case_table_names = 2` [492], the server could not read partitioned tables whose names contained uppercase letters.

  Partitioned tables using mixed case names should be renamed or dropped before upgrading to this version of the server on Mac OS X. (Bug #37402)

- **Important Change**: **Partitioning**: The statements `ANALYZE TABLE`, `CHECK TABLE`, `OPTIMIZE TABLE`, and `REPAIR TABLE` are now supported for partitioned tables.

  Also as a result of this fix, the following statements which were disabled in MySQL 5.1.24 have been re-enabled:

  - `ALTER TABLE ... ANALYZE PARTITION`
  - `ALTER TABLE ... CHECK PARTITION`
  - `ALTER TABLE ... OPTIMIZE PARTITION`
  - `ALTER TABLE ... REPAIR PARTITION`

  (Bug #20129)

  References: See also Bug #39434.

- **Replication**: The `--replicate-*-table` options were not evaluated correctly when replicating multi-table updates.

  As a result of this fix, replication of multi-table updates no longer fails when an update references a missing table but does not update any of its columns. (Bug #37051)

- **Replication**: Issuing a `DROP DATABASE` while any temporary tables were open caused the server to switch to statement-based mode. (Bug #38773)
- The fix for Bug #33812 had the side effect of causing the `mysql` client not to be able to read some dump files produced with `mysqldump`. To address this, that fix was reverted. (Bug #38158)

Changes in MySQL 5.1.26 (2008-06-30)

Functionality Added or Changed

- **Important Change**: **Incompatible Change**: The `FEDERATED` storage engine is now disabled by default in binary distributions. The engine is still available and can be enabled by starting the server with the `--federated` option. (Bug #37069)
- `mysqltest` was changed to be more robust in the case of a race condition that can occur for rapid disconnect/connect sequences with the server. The account used by `mysqltest` could reach its permitted simultaneous-sessions user limit if the connect attempt occurred before the server had fully processed the preceding disconnect. `mysqltest` now checks specifically for a user-limits error when it connects; if that error occurs, it delays briefly before retrying. (Bug #23921)

Bugs Fixed

- **Replication**: Row-based replication broke for `utf8` `CHAR` columns longer than 85 characters. (Bug #37426)
- **Replication**: Performing an insert on a table having an `AUTO_INCREMENT` column and an `INSERT` trigger that was being replicated from a master running MySQL 5.0 or any version of MySQL 5.1 up to and including MySQL 5.1.11 to a slave running MySQL 5.1.12 or later caused the replication slave to crash. (Bug #36443)

  References: See also Bug #33029.
- `NOT IN` subqueries that selected `MIN()` [1047] or `MAX()` [1046] values but produced an empty result could cause a server crash. (Bug #37004)
- Some binary distributions had a duplicate “-64bit” suffix in the file name. (Bug #37623)
- `ha_innodb.so` was incorrectly installed in the `lib/mysql` directory rather than in `lib/mysql/plugin`. (Bug #36434)
- The `mysql` client incorrectly parsed statements containing the word “delimiter” in mid-statement.

  The fix for this bug had the side effect of causing the problem reported in Bug #38158, so it was reverted in MySQL 5.1.27. (Bug #33812)
- The code for detecting a byte order mark (BOM) caused `mysql` to crash for empty input. (Bug #35480)
- An empty bit-string literal (`b''`) caused a server crash. Now the value is parsed as an empty bit value (which is treated as an empty string in string context or 0 in numeric context). (Bug #35658)

Changes in MySQL 5.1.25 (2008-05-28)

Functionality Added or Changed

- **Incompatible Change**: A change has been made to the way that the server handles prepared statements. This affects prepared statements processed at the SQL level (using the `PREPARE` statement) and those processed using the binary client/server protocol (using the `mysql_stmt_prepare()` C API function).

  Previously, changes to metadata of tables or views referred to in a prepared statement could cause a server crash when the statement was next executed, or perhaps an error at execute time with a crash occurring later. For example, this could happen after dropping a table and recreating it with a different definition.

  Now metadata changes to tables or views referred to by prepared statements are detected and cause automatic repreparation of the statement when it is next executed.

  The server attempts repreparation up to three times. An error occurs if all attempts fail.

Metadata changes occur for DDL statements such as those that create, drop, alter, rename, or truncate tables, or that analyze, optimize, or repair tables. Repreparation also occurs after referenced tables or views are flushed from the table definition cache, either implicitly to make room for new entries in the cache, or explicitly due to `FLUSH TABLES`.

Table content changes (for example, with `INSERT` or `UPDATE`) do not cause repreparation, nor do `SELECT` statements.

Repreparation is automatic, but to the extent that it occurs, performance of prepared statements is diminished.

Repreparation uses the default database and SQL mode that were in effect for the original preparation.

A status variable, `Com_stmt_reprepare`, has been introduced to track the number of repreparations.

Along with this change to statement repreparation, the default value of the `table_definition_cache` [529] system variable has been increased from 128 to 256. The purpose of this increase is to lessen the chance that prepared statements will need repreparation due to referred-to tables/views having been flushed from the cache to make room for new entries.

An incompatibility with previous versions of MySQL is that a prepared statement may now return a different set of columns or different column types from one execution to the next. For example, if the prepared statement is `SELECT * FROM t1`, altering `t1` to contain a different number of columns causes the next execution to return a number of columns different from the previous execution.

Older versions of the client library cannot handle this change in behavior. For applications that use prepared statements with the new server, an upgrade to the new client library is strongly recommended. (Bug #27420, Bug #27430, Bug #27690)

- **Important Change**: Some changes were made to `CHECK TABLE ... FOR UPGRADE` and `REPAIR TABLE` with respect to detection and handling of tables with incompatible `.frm` files (files created with a different version of the MySQL server). These changes also affect `mysqlcheck` because that program uses `CHECK TABLE` and `REPAIR TABLE`, and thus also `mysql_upgrade` because that program invokes `mysqlcheck`.

  - If your table was created by a different version of the MySQL server than the one you are currently running, `CHECK TABLE ... FOR UPGRADE` indicates that the table has an `.frm` file with an incompatible version. In this case, the result set returned by `CHECK TABLE` contains a line with a `Msg_type` value of `error` and a `Msg_text` value of `Table upgrade required. Please do "REPAIR TABLE` `` `tbl_name` `` `" to fix it!`

  - `REPAIR TABLE` without `USE_FRM` upgrades the `.frm` file to the current version.

  - If you use `REPAIR TABLE ...USE_FRM` and your table was created by a different version of the MySQL server than the one you are currently running, `REPAIR TABLE` will not attempt to repair the table. In this case, the result set returned by `REPAIR TABLE` contains a line with a `Msg_type` value of `error` and a `Msg_text` value of `Failed repairing incompatible .FRM file`.

    Previously, use of `REPAIR TABLE ...USE_FRM` with a table created by a different version of the MySQL server risked the loss of all rows in the table.

  (Bug #36055)

- `mysql_upgrade` now has a `--tmpdir` [256] option to enable the location of temporary files to be specified. (Bug #36469)

- `mysqldump` now adds the `LOCAL` qualifier to the `FLUSH TABLES` statement that is sent to the server when the `--master-data` [298] option is enabled. This prevents the `FLUSH TABLES` statement

from replicating to slaves, which is disadvantageous because it would cause slaves to block while the statement executes. (Bug #35157)

References: See also Bug #38303.

Bugs Fixed

- **Important Change**: The server no longer issues warnings for truncation of excess spaces for values inserted into `CHAR` columns. This reverts a change in the previous release that caused warnings to be issued. (Bug #30059)
- **Replication**: When flushing tables, there was a slight chance that the flush occurred between the processing of one table map event and the next. Since the tables were opened one by one, subsequent locking of tables would cause the slave to crash. This problem was observed when replicating `NDBCLUSTER` or `InnoDB` tables, when executing multi-table updates, and when a trigger or a stored routine performed an (additional) insert on a table so that two tables were effectively being inserted into in the same statement. (Bug #36197)
- **Replication**: `CREATE PROCEDURE` and `CREATE FUNCTION` statements containing extended comments were not written to the binary log correctly, causing parse errors on the slave. (Bug #36570)

  References: See also Bug #32575.
- **Replication**: `CREATE VIEW` statements containing extended comments were not written to the binary log correctly, causing parse errors on the slave. Now, all comments are stripped from such statements before being written to the binary log. (Bug #32575)

  References: See also Bug #36570.
- Executing a `FLUSH PRIVILEGES` statement after creating a temporary table in the `mysql` database with the same name as one of the MySQL system tables caused the server to crash.

  Note

  While it is possible to shadow a system table in this way, the temporary table exists only for the current user and connection, and does not effect any user privileges.

  (Bug #33275)
- `UNION` constructs cannot contain `SELECT ... INTO` except in the final `SELECT`. However, if a `UNION` was used in a subquery and an `INTO` clause appeared in the top-level query, the parser interpreted it as having appeared in the `UNION` and raised an error. (Bug #32858)
- Assignment of relative path names to `general_log_file` [478] or `slow_query_log_file` [523] did not always work. (Bug #32748)
- The `log_output` [489] system variable could be set to an illegal value. (Bug #34820)
- An incorrect error and message was produced for attempts to create a `MyISAM` table with an index (`.MYI`) file name that was already in use by some other `MyISAM` table that was open at the same time. For example, this might happen if you use the same value of the `INDEX DIRECTORY` table option for tables belonging to different databases. (Bug #35733)
- Some binaries produced stack corruption messages due to being built with versions of `bison` older than 2.1. Builds are now created using `bison` 2.3. (Bug #34926)
- The `mysql.servers` table was not created during installation on Windows. (Bug #28680, Bug #32797)
- On Windows, the installer attempted to use JScript to determine whether the target data directory already existed. On Windows Vista x64, this resulted in an error because the installer was attempting

to run the JScript in a 32-bit engine, which wasn't registered on Vista. The installer no longer uses JScript but instead relies on a native WiX command. (Bug #36103)

- `mysqltest` was performing escape processing for the `--replace_result` command, which it should not have been. (Bug #36041)
- `mysqltest` ignored the value of `--tmpdir` in one place. (Bug #36465)
- Conversion of a `FLOAT ZEROFILL` value to string could cause a server crash if the value was `NULL`. (Bug #36139)
- `mysql_upgrade` did not properly update the `mysql.event` table. (Bug #35824)
- The `MERGE` storage engine did a table scan for `SELECT COUNT(*)` statements when it could calculate the number of records from the underlying tables. (Bug #36006)
- The server crashed inside `NOT IN` subqueries with an impossible `WHERE` or `HAVING` clause, such as `NOT IN (SELECT ... FROM t1, t2, ... WHERE 0)`. (Bug #36005)
- Grouping or ordering of long values in unindexed `BLOB` or `TEXT` columns with the `gbk` or `big5` character set crashed the server. (Bug #35993)
- Enabling the `read_only` [517] system variable while `autocommit` [461] mode was enabled caused `SELECT` statements for transactional storage engines to fail. (Bug #35732)
- An error in calculation of the precision of zero-length items (such as `NULL`) caused a server crash for queries that employed temporary tables. (Bug #36023)
- Several additional configuration scripts in the `BUILD` directory now are included in source distributions. These may be useful for users who wish to build MySQL from source. (See Installing MySQL from a Development Source Tree, for information about what they do.) (Bug #34291)
- `SET GLOBAL debug=''` resulted in a Valgrind warning in `DbugParse()`, which was reading beyond the end of the control string. (Bug #35986)
- The combination of `GROUP_CONCAT()` [1046], `DISTINCT`, and `LEFT JOIN` could crash the server when the right table is empty. (Bug #35298)
- The server ignored any covering index used for `ref` [697] access of a table in a query with `ORDER BY` if this index was incompatible with the `ORDER BY` list and there was another covering index compatible with this list. As a result, suboptimal execution plans were chosen for some queries that used an `ORDER BY` clause. (Bug #35844)
- On Windows 64-bit builds, an apparent compiler bug caused memory overruns for code in `innobase/mem/*`. Removed optimizations so as not to trigger this problem. (Bug #34297)
- The Event Scheduler was not designed to work under the embedded server. It is now disabled for the embedded server, and the `event_scheduler` [474] system variable is not displayed. (Bug #35997)
- Multiple-table `UPDATE` statements that used a temporary table could fail to update all qualifying rows or fail with a spurious duplicate-key error. (Bug #36676)
- A `REGEXP` [963] match could return incorrect rows when the previous row matched the expression and used `CONCAT()` [951] with an empty string. (Bug #36488)
- For `EXPLAIN EXTENDED`, execution of an uncorrelated `IN` subquery caused a crash if the subquery required a temporary table for its execution. (Bug #36011)
- On Windows 64-bit systems, temporary variables of `long` types were used to store `ulong` values, causing key cache initialization to receive distorted parameters. The effect was that setting `key_buffer_size` [483] to values of 2GB or more caused memory exhaustion to due allocation of too much memory. (Bug #36705)

- When updating an existing instance (for example, from MySQL 5.0 to 5.1, or 5.1 to 6.0), the Instance Configuration Wizard unnecessarily prompted for a `root` password when there was an existing `root` password. (Bug #36305)
- The “prefer full scan on clustered primary key over full scan of any secondary key” optimizer rule introduced by Bug #26447 caused a performance regression for some queries, so it has been disabled. (Bug #35850)
- The internal `init_time()` library function was renamed to `my_init_time()` to avoid conflicts with external libraries. (Bug #26294)
- The `jp` test suite was not working. (Bug #28563)
- The parser used signed rather than unsigned values in some cases that caused legal lengths in column declarations to be rejected. (Bug #15776)

Changes in MySQL 5.1.24 (2008-04-08)

Functionality Added or Changed

- **Important Change**: **MySQL Cluster**: **Packaging**: Beginning with this release, standard MySQL 5.1 binaries are no longer built with support for the `NDBCLUSTER` storage engine, and the `NDBCLUSTER` code included in 5.1 mainline sources is no longer guaranteed to be maintained or supported. Those using MySQL Cluster in MySQL 5.1.23 and earlier MySQL 5.1 mainline releases should upgrade to MySQL Cluster NDB 6.2.15 or a later MySQL Cluster NDB 6.2 or 6.3 release. (Bug #36193)
- **Important Change**: The `FEDERATED` storage engine is not included in binary distributions of MySQL 5.1.24. (It will be included again in 5.1.25.)
- **Replication**: When running the server with `--binlog-format=MIXED` [419] or `--binlog-format=STATEMENT` [419], a query that referred to a system variable used the slave's value when replayed on the slave. This meant that, if the value of a system variable was inserted into a table, the slave differed from the master. Now, statements that refer to a system variable are marked as “unsafe”, which means that:
  - When the server is using `--binlog-format=MIXED` [419], the row-based format is used automatically to replicate these statements.
  - When the server is using `--binlog-format=STATEMENT` [419], these statements produce a warning.

  (Bug #31168)

  References: See also Bug #34732.
- **Replication**: Introduced the `slave_exec_mode` [1644] system variable to control whether idempotent or strict mode is used for replication conflict resolution. Idempotent mode suppresses duplicate-key, no-key-found, and some other errors, and is needed for circular replication, multi-master replication, and some other complex replication setups when using MySQL Cluster, where idempotent mode is the default. However, strict mode is the default for storage engines other than `NDB`. (Bug #31609)
- Formerly, when the MySQL server crashed, the generated stack dump was numeric and required external tools to properly resolve the names of functions. This is not very helpful to users having a limited knowledge of debugging techniques. In addition, the generated stack trace contained only the names of functions and was formatted differently for each platform due to different stack layouts.

  Now it is possible to take advantage of newer versions of the GNU C Library provide a set of functions to obtain and manipulate stack traces from within the program. On systems that use the ELF binary format, the stack trace contains important information such as the shared object where the call was generated, an offset into the function, and the actual return address. Having the function name also makes possible the name demangling of C++ functions.

The library generates meaningful stack traces on the following platforms: i386, x86_64, PowerPC, IA64, Alpha, and S390. On other platforms, a numeric stack trace is still produced, and the use of the `resolve_stack_dump` utility is still required. (Bug #31891)

- `mysqltest` now has `mkdir` and `rmdir` commands for creating and removing directories. (Bug #31004)
- For binary `.tar.gz` packages, `mysqld` and other binaries now are compiled with debugging symbols included to enable easier use with a debugger. If you do not need debugging symbols and are short on disk space, you can use `strip` to remove the symbols from the binaries. (Bug #33252)
- The `PROCESS` [627] privilege now is required to start or stop the `InnoDB` monitor tables (see `SHOW ENGINE INNODB STATUS` and the `InnoDB` Monitors). Previously, no privilege was required. (Bug #34053)
- Added the `Uptime_since_flush_status` [571] status variable, which indicates the number of seconds since the most recent `FLUSH STATUS` statement. (Community contribution by Jeremy Cole) (Bug #24822)
- The server uses less memory when loading privileges containing table grants. (Patch provided by Google.) (Bug #25175)
- `SHOW OPEN TABLES` now supports `FROM` and `LIKE` clauses. (Bug #12183)
- The use of `InnoDB` hash indexes now can be controlled by setting the new `innodb_adaptive_hash_index` [1360] system variable at server startup. By default, this variable is enabled. See Adaptive Hash Indexes.
- Formerly it was possible to specify an `innodb_flush_method` [1368] value of `fdatasync` to obtain the default flush behavior of using `fdatasync()` for flushing. This is no longer possible because it can be confusing that a value of `fdatasync` causes use of `fsync()` rather than `fdatasync()`.
- The new read-only global system variables `report_host` [519], `report_password` [519], `report_port` [520], and `report_user` [520] system variables provide runtime access to the values of the corresponding `--report-host` [1638], `--report-password` [1639], `--report-port` [1639], and `--report-user` [1639] options.

Bugs Fixed

- **Important Change**: **Security Fix**: It was possible to circumvent privileges through the creation of `MyISAM` tables employing the `DATA DIRECTORY` and `INDEX DIRECTORY` options to overwrite existing table files in the MySQL data directory. Use of the MySQL data directory in `DATA DIRECTORY` and `INDEX DIRECTORY` is no longer permitted. This is now also true of these options when used with partitioned tables and individual partitions of such tables.

  Note

  Additional fixes were made in MySQL 5.1.28, 5.1.41.

  (Bug #32167, CVE-2008-2079)

  References: See also Bug #39277.

- **Security Fix**: A client that connects to a malicious server could be tricked by the server into sending files from the client host to the server. This occurs because the `libmysqlclient` client library would respond to a `FETCH LOCAL FILE` request from the server even if the request is sent for statements from the client other than `LOAD DATA LOCAL INFILE`. The client library has been modified to respond to a `FETCH LOCAL FILE` request from the server only if is sent in response to a `LOAD DATA LOCAL INFILE` statement from the client.

The client library now also checks whether `CLIENT_LOCAL_FILE` is set and refuses to send a local file if not.

Note

Binary distributions ship with the `local-infile` capability enabled. Applications that do not use this functionality should disable it to be safe.

(Bug #29605)

- **Important Change**: **Security Enhancement**: On Windows Vista and Windows Server 2008, a user without administrative privileges does not have write permissions to the `Program Files` directory where MySQL and the associated data files are normally installed. Using data files located in the standard `Program Files` installation directory could therefore cause MySQL to fail, or lead to potential security issues in an installed instance.

  To address the problem, on Windows XP, Windows Vista and Windows Server 2008, the datafiles and data file configuration are now set to the Microsoft recommended `AppData` folder. The `AppData` folder is typically located within the user's home directory.

  Important

  When upgrading an existing 5.1.23 or 6.0.4 installation of MySQL you must take a backup of your data and configuration file (`my.ini` before installing the new version. To migrate your data, either extract the data and re-import (using `mysqldump`, then upgrade and re-import using `mysql`), or back up your data, upgrade to the new version, and copy your existing data files from your old `datadir` directory to the new directory located within `AppData`.

  Failure to back up your data and follow these procedures may lead to data loss.

  (Bug #34593)

- **Performance**: `InnoDB` adaptive hash latches could be held too long during filesort operations, resulting in a server crash. Now the hash latch is released when a query on `InnoDB` tables performs a filesort. This eliminates the crash and may provide significant performance improvements on systems on which many queries using filesorts with temporary tables are being performed. (Bug #32149)

- **Performance**: `InnoDB` exhibited thread thrashing with more than 50 concurrent connections under an update-intensive workload. (Bug #22868)

- **Incompatible Change**: It was possible to use `FRAC_SECOND` as a synonym for `MICROSECOND` with `DATE_ADD()` [983], `DATE_SUB()` [986], and `INTERVAL` [943]; now, using `FRAC_SECOND` with anything other than `TIMESTAMPADD()` [993] or `TIMESTAMPDIFF()` [994] produces a syntax error.

  It is now possible (and preferable) to use `MICROSECOND` with `TIMESTAMPADD()` [993] and `TIMESTAMPDIFF()` [994], and `FRAC_SECOND` is now deprecated. (Bug #33834)

- **Incompatible Change**: The `-`, `*`, and `/` operators and the functions `POW()` [975] and `EXP()` [973] could misbehave when used with floating-point numbers. Previously they might return `+INF`, `-INF`, or `NaN` in cases of numeric overflow (including that caused by division by zero) or when invalid arguments were used. Now `NULL` is returned in all such cases. (Bug #31236)

- **Incompatible Change**: The `UPDATE` statement permitted `NULL` to be assigned to `NOT NULL` columns (the implicit default value for the column data type was assigned). This was changed so that on error occurs.

This change was reverted, because the original report was determined not to be a bug: Assigning `NULL` to a `NOT NULL` column in an `UPDATE` statement should produce an error only in strict SQL mode and set the column to the implicit default with a warning otherwise, which was the original behavior. See Data Type Default Values, and Bug #39265. (Bug #33699)

- **Incompatible Change**: In MySQL 5.1.23, the `last_errno` and `last_error` members of the `NET` structure in `mysql_com.h` were renamed to `client_last_errno` and `client_last_error`. This was found to cause problems for connectors that use the internal `NET` structure for error handling. The change has been reverted. (Bug #34655)

  References: See also Bug #12713.

- **Incompatible Change**: For packages that are built within their own prefix (for example, `/usr/local/mysql`) the plugin directory will be `lib/plugin`. For packages that are built to be installed into a system-wide prefix (such as RPM packages with a prefix of `/usr`), the plugin directory will be `lib/mysql/plugin` to ensure a clean `/usr/lib` hierarchy. In both cases, the `$pkglibdir` configuration setting is used at build time to set the plugin directory.

  The current plugin directory location is available as the value of the `plugin_dir` [510] system variable as before, but the `mysql_config` script now has a `--plugindir` [383] option that can be used externally to the server by third-party plugin writers to obtain the default plugin directory path name and configure their installation directory appropriately. (Bug #31736)

- **Incompatible Change**: Previously, the parser accepted the ODBC `{ OJ ... LEFT OUTER JOIN ...}` syntax for writing left outer joins. The parser now permits `{ OJ ... }` to be used to write other types of joins, such as `INNER JOIN` or `RIGHT OUTER JOIN`. This helps with compatibility with some third-party applications, but is not official ODBC syntax.

  A consequence of this change is that the parser no longer permits nested `{ OJ ... }` constructs (which are not legal ODBC syntax, anyway). Queries that use such constructs should be rewritten. For example, this query is now produces an error:

```
SELECT * FROM
   {OJ
      {OJ a LEFT OUTER JOIN b ON a.a1=b.a1}
      LEFT OUTER JOIN c ON b.b1 = c.b1};
```

  That can be replaced by any of the following rewrites:

```
SELECT * FROM
    {OJ a LEFT OUTER JOIN b
          LEFT OUTER JOIN c ON b.b1 = c.b1 ON a.a1=b.a1};

SELECT * FROM
   {OJ a LEFT OUTER JOIN b ON a.a1=b.a1
         LEFT OUTER JOIN c ON b.b1 = c.b1};

SELECT * FROM
     a LEFT OUTER JOIN b ON a.a1=b.a1 LEFT OUTER JOIN c ON b.b1 = c.b1;
```

  The first two are legal according to ODBC, and you nest the joins inside a single `{ OJ ...}` clause. The third is standard SQL syntax, without ODBC decoration. It can be used with parentheses to emphasize the evaluation order:

```
SELECT * FROM
     ((a LEFT OUTER JOIN b ON a.a1=b.a1)
         LEFT OUTER JOIN c ON b.b1 = c.b1);
```

  (Bug #28317)

- **Incompatible Change**: The `utf8_general_ci` and `ucs2_general_ci` collations did not sort the letter "U+00DF SHARP S" equal to `'s'`.

As a result of this bug fix, indexes must be rebuilt for columns that use the `utf8_general_ci` or `ucs2_general_ci` collation for columns that contain SHARP S. See Checking Whether Tables or Indexes Must Be Rebuilt. (Bug #27877)

References: See also Bug #37046.

- **Important Change**: **Partitioning**: The following statements did not function correctly with corrupted or crashed tables and have been disabled:

  - `ALTER TABLE ... ANALYZE PARTITION`
  - `ALTER TABLE ... CHECK PARTITION`
  - `ALTER TABLE ... OPTIMIZE PARTITION`
  - `ALTER TABLE ... REPAIR PARTITION`

  `ALTER TABLE ... REBUILD PARTITION` is unaffected by this change and continues to be available. This statement and `ALTER TABLE ... REORGANIZE PARTITION` may be used to analyze and optimize partitioned tables, since these operations cause the partition files to be rebuilt. (Bug #20129)

  References: See also Bug #39434.

- **Important Change**: **Replication**: When the master crashed during an update on a transactional table while in `autocommit` [461] mode, the slave failed. This fix causes every transaction (including `autocommit` [461] transactions) to be recorded in the binary log as starting with a `BEGIN` and ending with a `COMMIT` or `ROLLBACK`.

  Note

  The current fix does *not* cause nontransactional changes to be wrapped in `BEGIN` ... `COMMIT` or `BEGIN` ... `ROLLBACK` when written to the binary log. For this purpose, any statements affecting tables using a nontransactional storage engine such as `MyISAM` are regarded as nontransactional, even when `autocommit` [461] is enabled.

  (Bug #26395)

  References: See also Bug #29288, Bug #49522.

- **Important Change**: `InnoDB` free space information is now shown in the `Data_free` column of `SHOW TABLE STATUS` and in the `DATA_FREE` column of the `INFORMATION_SCHEMA.TABLES` table. (Bug #32440)

  References: See also Bug #11379.

- **Important Change**: The server handled truncation of values having excess trailing spaces into `CHAR`, `VARCHAR`, and `TEXT` columns in different ways. This behavior has now been made consistent for columns of all three of these types, and now follows the existing behavior of `VARCHAR` columns in this regard; that is, a `Note` is always issued whenever such truncation occurs.

  This change does not affect columns of these three types when using a binary encoding; `BLOB` columns are also unaffected by the change, since they always use a binary encoding. (Bug #30059)

- **Important Change**: An `AFTER UPDATE` trigger was not invoked when the `UPDATE` did not make any changes to the table for which the trigger was defined. Now `AFTER UPDATE` triggers behave the same in this regard as do `BEFORE UPDATE` triggers, which are invoked whether the `UPDATE` makes any changes in the table or not. (Bug #23771)

- **Replication**: **Important Note**: Network timeouts between the master and the slave could result in corruption of the relay log. This fix rectifies a long-standing replication issue when using unreliable networks, including replication over wide area networks such as the Internet. If you experience reliability issues and see many `You have an error in your SQL syntax` errors on replication slaves, we strongly recommend that you upgrade to a MySQL version which includes this fix. (Bug #26489)

- **Partitioning**: A table defined using `PARTITION BY KEY` and having a `BIT` column referenced in the partitioning key did not behave correctly; some rows could be inserted into the wrong partition, causing wrong results to be returned from queries. (Bug #33379)

- **Partitioning**: Using the `DATA DIRECTORY` and `INDEX DIRECTORY` options for partitions with `CREATE TABLE` or `ALTER TABLE` statements appeared to work on Windows, although they are not supported by MySQL on Windows systems, and subsequent attempts to use the tables referenced caused errors. Now these options are disabled on Windows, and attempting to use them generates a warning. (Bug #30459)

- **Partitioning**: Currently, all partitions of a partitioned table must use the same storage engine. One may optionally specify the storage engine on a per-partition basis; however, where this is the done, the storage engine must be the same as used by the table as a whole. `ALTER TABLE` did not enforce these rules correctly, the result being that inaccurate error messages were shown when trying to use the statement to change the storage engine used by an individual partition or partitions. (Bug #31931)

- **Partitioning**: When `ALTER TABLE DROP PARTITION` was executed on a table on which there was a trigger, the statement failed with an error. This occurred even if the trigger did not reference any tables. (Bug #32943)

- **Partitioning**: In some cases, matching rows from a partitioned `MyISAM` using a `BIT` column as the primary key were not found by queries. (Bug #34358)

- **Partitioning**: Enabling `innodb_file_per_table` [1367] produced problems with partitioning and tablespace operations on partitioned `InnoDB` tables, in some cases leading to corrupt partitions or causing the server to crash. (Bug #33429)

- **Partitioning**: For `InnoDB` tables, there was a race condition involving the data dictionary and repartitioning. (Bug #33349)

- **Replication**: The failure of a `CREATE TABLE ... ENGINE=InnoDB ... SELECT` statement caused the slave to lose data. (Bug #35762)

- **Replication**: When a stored routine or trigger, running on a master that used MySQL 5.0 or MySQL 5.1.11 or earlier, performed an insert on an `AUTO_INCREMENT` column, the `insert_id` [482] value was not replicated correctly to a slave running MySQL 5.1.12 or later (including any MySQL 6.0 release). (Bug #33029)

  References: See also Bug #19630.

- **Replication**: `insert_id` [482] was not written to the binary log for inserts into `BLACKHOLE` tables. (Bug #35178)

- **Replication**: When using row-based logging, nontransactional updates were not written atomically to the binary log. If a nontransactional update was made concurrently with some other update, this could cause incorrect binary logging, and consequently the slave could diverge from the master. Now, nontransactional updates are always written atomically to the binary log. (Bug #29020)

- **Replication**: When using statement-based replication and a `DELETE`, `UPDATE`, or `INSERT ... SELECT` statement using a `LIMIT` clause is encountered, a warning that the statement is not safe to replicate in statement mode is now issued; when using `MIXED` mode, the statement is now replicated using the row-based format. (Bug #34768)

- **Replication**: The character sets and collations used for constant identifiers in stored procedures were not replicated correctly. (Bug #34289)
- **Replication**: Errors due to server ID conflicts were reported only in the slave's error log; now these errors are also shown in the `Server_IO_State` column in the output of `SHOW SLAVE STATUS`. (Bug #31316)
- **Replication**: `mysqlbinlog` did not output the values of `auto_increment_increment` [1622] and `auto_increment_offset` [1624] when both were equal to their default values (for both of these variables, the default is 1). This meant that a binary log recorded by a client using the defaults for both variables and then replayed on another client using its own values for either or both of these variables produced erroneous results. (Bug #34732)

  References: See also Bug #31168.
- **Replication**: An extraneous `ROLLBACK` statement was written to the binary log by a connection that did not use any transactional tables. (Bug #33329)
- **Replication**: `STOP SLAVE` did not stop connection attempts properly. If the I/O slave thread was attempting to connect, `STOP SLAVE` waited for the attempt to finish, sometimes for a long period of time, rather than stopping the slave immediately. (Bug #31024)

  References: See also Bug #30932.
- **Replication**: When the Windows version of `mysqlbinlog` read 4.1 binlogs containing `LOAD DATA INFILE` statements, it output backslashes as path separators, causing problems for client programs expecting forward slashes. In such cases, it now converts `\\` to `/` in directory paths. (Bug #34355)
- **Replication**: `mysqlbinlog` failed to release all of its memory after terminating abnormally. (Bug #33247)
- **Replication**: `mysqlbinlog` from a 5.1 or later MySQL distribution could not read binary logs generated by a 4.1 server when the logs contained `LOAD DATA INFILE` statements. (Bug #34141)

  References: This bug was introduced by Bug #32407.
- **Replication**: `SHOW SLAVE STATUS` failed when slave I/O was about to terminate. (Bug #34305)
- **Replication**: The error message generated due to lack of a default value for an extra column was not sufficiently informative. (Bug #32971)
- **Replication**: A `CREATE USER`, `DROP USER`, or `RENAME USER` statement that fails on the master, or that is a duplicate of any of these statements, is no longer written to the binlog; previously, either of these occurrences could cause the slave to fail. (Bug #33862)

  References: See also Bug #29749.
- **Replication**: The `--base64-output` [349] option for `mysqlbinlog` was not honored for all types of events. This interfered in some cases with performing point-in-time recovery. (Bug #32407)

  References: See also Bug #46640, Bug #34777.
- **Replication**: `SHOW BINLOG EVENTS` could fail when the binlog contained one or more events whose size was close to the value of `max_allowed_packet` [493]. (Bug #33413)
- **Replication**: Setting `server_id` [521] did not update its value for the current session. (Bug #28908)
- **Replication**: SQL statements containing comments using `--` syntax were not replayable by `mysqlbinlog`, even though such statements replicated correctly. (Bug #32205)
- **Replication**: Issuing a `DROP VIEW` statement caused replication to fail if the view did not actually exist. (Bug #30998)

- **Replication**: When a user variable was used inside an `INSERT` statement, the corresponding binlog event was not written to the binlog correctly. (Bug #32580)
- **Replication**: Replicating write, update, or delete events from a master running MySQL 5.1.15 or earlier to a slave running 5.1.16 or later caused the slave to crash. (Bug #31581)
- **Replication**: When using row-based replication from a master running MySQL 5.1.21 or earlier to a slave running 5.1.22 or later, updates of integer columns failed on the slave with `Error in Unknown event: row application failed`. (Bug #31583)

  References: This bug was introduced by Bug #21842.
- **Replication**: When using row-based replication, deletes from a table with a foreign key constraint failed on the slave. (Bug #32468)
- **Replication**: When using row-based replication, the slave stopped when attempting to delete nonexistent rows from a slave table without a primary key. In addition, no error was reported when this occurred. (Bug #31552)
- **Replication**: Replication crashed with the `NDB` storage engine when `mysqld` was started with `--character-set-server=ucs2` [422]. (Bug #29562)
- **Replication**: Replication of `LOAD DATA INFILE` could fail when `read_buffer_size` [516] was larger than `max_allowed_packet` [493]. (Bug #30435)
- **Replication**: When using row-based replication, a slave could crash at startup because it received a row-based replication event that `InnoDB` could not handle due to an incorrect test of the query string provided by MySQL, which was `NULL` for row-based replication events. (Bug #35226)
- **Replication**: The nonspecific error message `Wrong parameters to function register_slave` resulted when `START SLAVE` failed to register on the master due to excess length of any the slave server options `--report-host` [1638], `--report-user` [1639], or `--report-password` [1639]. An error message specific to each of these options is now returned in such cases. The new error messages are:

  - `Failed to register slave: too long 'report-host'`
  - `Failed to register slave: too long 'report-user'`
  - `Failed to register slave; too long 'report-password'`

  (Bug #22989)

  References: See also Bug #19328.
- **Replication**: `MASTER_POS_WAIT()` did not return `NULL` when the server was not a slave. (Bug #26622)
- **Replication**: Some older servers wrote events to the binary log using different numbering from what is currently used, even though the file format number in the file is the same. Slaves running MySQL 5.1.18 and later could not read these binary logs properly. Binary logs from these older versions now are recognized and event numbers are mapped to the current numbering so that they can be interpreted properly. (Bug #27779, Bug #32434)

  References: This bug was introduced by Bug #22583.
- **Replication**: `PURGE BINARY LOGS TO` and `PURGE BINARY LOGS BEFORE` did not handle missing binary log files correctly or in the same way. Now for both of these statements, if any files listed in the `.index` file are missing from the file system, the statement fails with an error. (Bug #18199, Bug #18453)
- **Replication**: `START SLAVE UNTIL MASTER_LOG_POS=`*`position`* issued on a slave that was using `--log-slave-updates` [1628] and that was involved in circular replication would cause the slave to run and stop one event later than that specified by the value of *`position`*. (Bug #13861)

- When upgrading from MySQL 5.1.19 to any version between MySQL 5.1.20 to MySQL 5.1.23, the MySQL Instance Configuration Wizard would fail to account for the change in name for the `mysqld-nt.exe` to `mysqld.exe`, causing MySQL to fail to start properly after the upgrade. (Bug #31674)

- When a view containing a reference to `DUAL` was created, the reference was removed when the definition was stored, causing some queries against the view to fail with invalid SQL syntax errors. (Bug #35193)

- `SELECT ... FROM INFORMATION_SCHEMA.REFERENTIAL_CONSTRAINTS` caused the server to crash if the table referenced by a foreign key had been dropped. This issue was observed on Windows platforms only. (Bug #35108)

  References: See also Bug #35406.

- Creating a foreign key on an `InnoDB` table that was created with an explicit `AUTO_INCREMENT` value caused that value to be reset to 1. (Bug #34920)

  References: This bug is a regression of Bug #23313.

- Dropping a function after dropping the function's creator could cause the server to crash. (Bug #33464)

- The `CSV` engine did not honor update requests for `BLOB` columns when the new column value had the same length as the value to be updated. (Bug #33067)

- Using **Control+R** in the `mysql` client caused it to crash. (Bug #33288)

- Manually replacing a binary log file with a directory having the same name caused an error that was not handled correctly. (Bug #35675)

- In some cases, when too many clients tried to connect to the server, the proper `SQLSTATE` code was not returned. (Bug #35289)

- `mysqldump` failed to return an error code when using the `--master-data` [298] option without binary logging being enabled on the server. (Bug #34909)

- A malformed URL used for a `FEDERATED` table's `CONNECTION` option value in a `CREATE TABLE` statement was not handled correctly and could crash the server. (Bug #34788)

- Executing a `TRUNCATE TABLE` statement on a table having both a foreign key reference and a `DELETE` trigger crashed the server. (Bug #34643)

- A query using `WHERE (column1='string1' AND column2=constant1) OR (column1='string2' AND column2=constant2)`, where `col1` used a binary collation and *`string1`* matched *`string2`* except for case, failed to match any records even when matches were found by a query using the equivalent clause `WHERE column2=constant1 OR column2=constant2`. (Bug #33833)

- Reuse of prepared statements could cause a memory leak in the embedded server. (Bug #33796)

- In some cases a query that produced a result set when using `ORDER BY ASC` did not return any results when this was changed to `ORDER BY DESC`. (Bug #33758)

- In some cases where setting a system variable failed, no error was sent to the client, causing the client to hang. (Bug #32757)

- Queries using `LIKE` on tables having indexed `CHAR` columns using either of the `eucjpms` or `ujis` character sets did not return correct results. (Bug #32510)

- Queries testing numeric constants containing leading zeros against `ZEROFILL` columns were not evaluated correctly. (Bug #31887)

- The server returned the error message `Out of memory; restart server and try again` when the actual problem was that the sort buffer was too small. Now an appropriate error message is returned in such cases. (Bug #31590)

- A table having an index that included a `BLOB` or `TEXT` column, and that was originally created with a MySQL server using version 4.1 or earlier, could not be opened by a 5.1 or later server. (Bug #31331)

- If an alias was used to refer to the value returned by a stored function within a subselect, the outer select recognized the alias but failed to retrieve the value assigned to it in the subselect. (Bug #30787)

  References: This bug is a regression of Bug #20777.

- `myisamchk` always reported the character set for a table as `latin1_swedish_ci (8)` regardless of the table' actual character set. (Bug #29182)

- The `mysql_config` command would output `CFLAGS` values that were incompatible with C++ for the HP-UX platform. (Bug #29645)

- Using `NAME_CONST()` with a negative number and an aggregate function caused MySQL to crash. This could also have a negative impact on replication. (Bug #34749)

- Creating a view inside a stored procedure could lead to a crash of the MySQL Server. (Bug #34587)

- Executing a prepared statement associated with a materialized cursor sent to the client a metadata packet with incorrect table and database names. The problem occurred because the server sent the name of the temporary table used by the cursor instead of the table name of the original table.

  The same problem occurred when selecting from a view, in which case the name of the table name was sent, rather than the name of the view. (Bug #32265)

- Passing anything other than an integer argument to a `LIMIT` clause in a prepared statement would fail. (This limitation was introduced to avoid replication problems; for example, replicating the statement with a string argument would cause a parse failure in the slave). Now, arguments to the `LIMIT` clause are converted to integer values, and these converted values are used when logging the statement. (Bug #33851)

- Executing an `ALTER VIEW` statement on a table crashed the server. (Bug #34337)

- Under some circumstances a combination of aggregate functions and `GROUP BY` in a `SELECT` query over a view could lead to incorrect calculation of the result type of the aggregate function. This in turn could lead to incorrect results, or to crashes on debug builds of the server. (Bug #33049)

- A view created with a string literal for one of the columns picked up the connection character set, but not the collation. Comparison to that field therefore used the default collation for that character set, causing an error if the connection collation was not compatible with the default collation. The problem was caused by text literals in a view being dumped with a character set introducer even when this was not necessary, sometimes leading to a loss of collation information. Now the character set introducer is dumped only if it was included in the original query. (Bug #32538)

  References: See also Bug #21505.

- A query that performed a `ref_or_null` [697] join where the second table used a key having one or columns that could be `NULL` and had a column value that was `NULL` caused the server to crash. (Bug #34945)

  References: This bug was introduced by Bug #12144.

- Some subqueries using an expression that included an aggregate function could fail or in some cases lead to a crash of the server. (Bug #34620)

- Under some conditions, a `SET GLOBAL innodb_commit_concurrency` or `SET GLOBAL innodb_autoextend_increment` statement could fail. (Bug #34223)

  References: This bug is a regression of Bug #31177.

- Some queries using a combination of `IN`, `CONCAT()` [951], and an implicit type conversion could return an incorrect result. (Bug #33764)

- For `DISTINCT` queries, MySQL 4.0 and 4.1 stopped reading joined tables as soon as the first matching row was found. However, this optimization was lost in MySQL 5.0, which instead read all matching rows. This fix for this regression may result in a major improvement in performance for `DISTINCT` queries in cases where many rows match. (Bug #32942)

- Certain combinations of views, subselects with outer references and stored routines or triggers could cause the server to crash. (Bug #33389)

- Repeated creation and deletion of views within prepared statements could eventually crash the server. (Bug #32890)

  References: See also Bug #34587.

- `SET GLOBAL myisam_max_sort_file_size=DEFAULT` set `myisam_max_sort_file_size` [501] to an incorrect value. (Bug #33382)

  References: See also Bug #31177.

- Granting the `UPDATE` [628] privilege on one column of a view caused the server to crash. (Bug #33201)

- The server crashed when executing a query that had a subquery containing an equality X=Y where Y referred to a named select list expression from the parent select. The server crashed when trying to use the X=Y equality for `ref` [697]-based access. (Bug #33794)

- Resetting the query cache by issuing a `SET GLOBAL query_cache_size=0` statement caused the server to crash if it concurrently was saving a new result set to the query cache. (Bug #30887)

- `mysqld` displayed the `--enable-pstack` [426] option in its help message even if MySQL was configured without `--with-pstack`. (Bug #29836)

- The server could crash when `REPEAT` or another control instruction was used in conjunction with labels and a `LEAVE` instruction. (Bug #33618)

- The parser permitted control structures in compound statements to have mismatched beginning and ending labels. (Bug #33618)

- `ROUND(X,D)` [977] or `TRUNCATE(X,D)` [978] for nonconstant values of *`D`* could crash the server if these functions were used in an `ORDER BY` that was resolved using `filesort`. (Bug #30889)

- For `DECIMAL` columns used with the `ROUND(X,D)` [977] or `TRUNCATE(X,D)` [978] function with a nonconstant value of *`D`*, adding an `ORDER BY` for the function result produced misordered output. (Bug #33143)

  References: See also Bug #33402, Bug #30617.

- `ORDER BY ... DESC` sorts could produce misordered results. (Bug #33697)

- The `Com_create_function` status variable was not incremented properly. (Bug #30252)

- The `Table_locks_waited` [570] waited variable was not incremented in the cases that a lock had to be waited for but the waiting thread was killed or the request was aborted. (Bug #30331)

- Tables in the `mysql` database that stored the current `sql_mode` [526] value as part of stored program definitions were not updated with newer mode values (`NO_ENGINE_SUBSTITUTION` [574],

PAD_CHAR_TO_FULL_LENGTH [575]). This causes various problems defining stored programs if those modes were included in the current sql_mode [526] value. (Bug #32633)

- The SHOW ENGINE INNODB STATUS and SHOW ENGINE INNODB MUTEX statements incorrectly required the SUPER [628] privilege rather than the PROCESS [627] privilege. (Bug #32710)
- Use of stored functions in the WHERE clause for SHOW OPEN TABLES caused a server crash. (Bug #34166)
- Large unsigned integers were improperly handled for prepared statements, resulting in truncation or conversion to negative numbers. (Bug #33798)
- Views were treated as insertable even if some base table columns with no default value were omitted from the view definition. (This is contrary to the condition for insertability that a view must contain all columns in the base table that do not have a default value.) (Bug #29477)
- On Windows, mysqltest_embedded.exe did not properly execute the send command. (Bug #32044)
- An internal buffer in mysql was too short. Overextending it could cause stack problems or segmentation violations on some architectures. (This is not a problem that could be exploited to run arbitrary code.) (Bug #33841)
- The mysqld crash handler failed on Windows. (Bug #31745)
- On Windows, the build process failed with four parallel build threads. (Bug #31929)
- make_binary_distribution passed the --print-libgcc-file option to the C compiler, but this does not work with the ICC compiler. (Bug #33536)
- The mysql_change_user() C API function caused global Com_*xxx* status variable values to be incorrect. (Bug #31222)
- After receiving a SIGHUP signal, the server could crash, and user-specified log options were ignored when reopening the logs. (Bug #33065)
- A variable named read_only [517] could be declared even though that is a reserved word. (Bug #31947)
- When sorting privilege table rows, the server treated escaped wildcard characters (\% and _) the same as unescaped wildcard characters (% and _), resulting in incorrect row ordering. (Bug #31194)
- When MySQL was built with OpenSSL, the SSL library was not properly initialized with information of which endpoint it was (server or client), causing connection failures. (Bug #33050)
- The MySQL preferences pane did not work to start or stop MySQL on Mac OS X 10.5 (Leopard). (Bug #28854)
- InnoDB could return an incorrect rows-updated value for UPDATE statements. (Bug #29157)
- DEFAULT 0 was not permitted for the YEAR data type. (Bug #34274)
- Threads created by the event scheduler were incorrectly counted against the max_connections [493] thread limit, which could lead to client lockout. (Bug #33507)
- Nonconnection threads were being counted in the value of the Max_used_connections [566] status variable. (Bug #35074)
- Disabling concurrent inserts caused some cacheable queries not to be saved in the query cache. (Bug #33756)
- SLEEP(0) [1042] failed to return on 64-bit Mac OS X due to a bug in pthread_cond_timedwait(). (Bug #33304)

- For InnoDB, exporting and importing a table could corrupt TINYBLOB columns, and a subsequent ALTER TABLE could corrupt TINYTEXT columns as well. (Bug #34300)
- For a TEMPORARY table, DELETE with no WHERE clause could fail when preceded by DELETE statements with a WHERE clause. (Bug #35392)
- For an indexed integer column *col_name* and a value *N* that is one greater than the maximum value permitted for the data type of *col_name*, conditions of the form WHERE *col_name* < *N* failed to return rows where the value of *col_name* is *N* - 1. (Bug #34731)
- Using LOAD DATA INFILE with a view could crash the server. (Bug #35469)
- InnoDB could crash if overflow occurred for an AUTO_INCREMENT column. (Bug #34335)
- If fsync() returned ENOLCK, InnoDB could treat this as fatal and cause abnormal server termination. InnoDB now retries the operation. (Bug #34823)
- Queries could return different results depending on whether ORDER BY columns were indexed. (Bug #35206)
- For InnoDB tables, ALTER TABLE DROP failed if the name of the column to be dropped began with "foreign". (Bug #35220)
- Loading plugins using command-line options to mysqld could cause an assertion failure. (Bug #33345)
- Selecting from INFORMATION_SCHEMA.REFERENTIAL_CONSTRAINTS could cause a server crash. (Bug #35406)

  References: See also Bug #35108.
- If the server crashed with an InnoDB error due to unavailability of undo slots, errors could persist during rollback when the server was restarted: There are two UNDO slot caches (for INSERT and UPDATE). If all slots end up in one of the slot caches, a request for a slot from the other slot cache would fail. This can happen if the request is for an UPDATE slot and all slots are in the INSERT slot cache, or vice versa. (Bug #35352)
- For some queries, the optimizer used an ordered index scan for GROUP BY or DISTINCT when it was supposed to use a loose index scan, leading to incorrect results. (Bug #34928)
- Under some circumstances, the value of mysql_insert_id() following a SELECT ... INSERT statement could return an incorrect value. This could happen when the last SELECT ... INSERT did not involve an AUTO_INCREMENT column, but the value of mysql_insert_id() was changed by some previous statements. (Bug #34889)
- A memory-handling error associated with use of GROUP_CONCAT() [1046] in subqueries could result in a server crash. (Bug #34747)
- Table and database names were mixed up in some places of the subquery transformation procedure. This could affect debugging trace output and further extensions of that procedure. (Bug #34830)
- If an error occurred during file creation, the server sometimes did not remove the file, resulting in an unused file in the file system. (Bug #31781)
- Enabling the PAD_CHAR_TO_FULL_LENGTH [575] SQL mode caused privilege-loading operations (such as FLUSH PRIVILEGES) to include trailing spaces from grant table values stored in CHAR columns. Authentication for incoming connections failed as a result. Now privilege loading does not include trailing spaces, regardless of SQL mode. (Bug #32753)
- Manifest problems prevented MySQLInstanceConfig.exe from running on Windows Vista. (Bug #30823)

- `CAST(AVG(arg) AS DECIMAL)` [1012] produced incorrect results for non-`DECIMAL` arguments. (Bug #34512)
- Queries such as `SELECT ROW(1, 2) IN (SELECT t1.a, 2) FROM t1 GROUP BY t1.a` (combining row constructors and subqueries in the `FROM` clause) could lead to assertion failure or unexpected error messages. (Bug #34763)
- Incorrect assertions could cause a server crash for `DELETE` triggers for transactional tables. (Bug #32790)
- On Windows, `SHOW PROCESSLIST` could display process entries with a `State` value of `*** DEAD ***`. (Bug #30960)
- `CREATE SERVER` and `ALTER SERVER` could crash the server if out-of-memory conditions occurred. (Bug #34790)
- An orphaned PID file from a no-longer-running process could cause `mysql.server` to wait for that process to exit even though it does not exist. (Bug #30378)
- Inserting strings with a common prefix into a table that used the `ucs2` character set corrupted the table. (Bug #32705)
- For `MyISAM` tables, `CHECK TABLE` (non-`QUICK`) and any form of `REPAIR TABLE` incorrected treated rows as corrupted under the combination of the following conditions:
  - The table had dynamic row format
  - The table had a `CHAR` (not `VARCHAR`) column longer than 127 bytes (for multi-byte character sets this could be less than 127 characters)
  - The table had rows with a significant length of more than 127 bytes significant length in that `CHAR` column (that is, a byte beyond byte position 127 must be a nonspace character)

  This problem affected `CHECK TABLE`, `REPAIR TABLE`, `OPTIMIZE TABLE`, `ALTER TABLE`. `CHECK TABLE` reported and marked the table as crashed if any row was present that fulfilled the third condition. The other statements deleted these rows. (Bug #33222)
- `ENUM`- or `SET`-valued plugin variables could not be set from the command line. (Bug #33358)
- For debug builds, reading from `INFORMATION_SCHEMA.TABLES` or `INFORMATION_SCHEMA.COLUMNS` could cause assertion failures. This could happen under rare circumstances when `INFORMATION_SCHEMA` fails to get information about a table (for example, when a connection is killed). (Bug #34656)
- A server running with the `--debug` [423] option could attempt to dereference a null pointer when opening tables, resulting in a crash. (Bug #34726)
- Binary logging for a stored procedure differed depending on whether or not execution occurred in a prepared statement. (Bug #30604)
- Dangerous pointer arithmetic crashed the server on some systems. (Bug #34598)
- For a `FEDERATED` table with an index on a nullable column, accessing the table could crash a server, return an incorrect result set, or return `ERROR 1030 (HY000): Got error 1430 from storage engine`. (Bug #33946)
- The per-thread debugging settings stack was not being deallocated before thread termination, resulting in a stack memory leak. (Bug #34424)
- Assigning an “incremental” value to the `debug` [469] system variable did not add the new value to the current value. For example, if the current `debug` [469] value was `'T'`, the statement `SET debug = '+P'` resulted in a value of `'P'` rather than the correct value of `'P:T'`. (Bug #34678)

- `mysqldump` attempts to set the `character_set_results` [465] system variable after connecting to the server. This failed for pre-4.1 servers that have no such variable, but `mysqldump` did not account for this and 1) failed to dump database contents; 2) failed to produce any error message alerting the user to the problem. (Bug #34192)
- Memory-allocation failures for attempts to set `key_buffer_size` [483] to large values could result in a server crash. (Bug #35272)
- View metadata returned from `INFORMATION_SCHEMA.VIEWS` was changed by the fix for Bug #11986, causing the information returned in MySQL 5.1 to differ from that returned in 5.0. (Bug #30217)
- `DROP SERVER` does not release memory cached for server structures created by `CREATE SERVER`, so repeated iterations of these statements resulted in a memory leak. `FLUSH PRIVILEGES` now releases the memory allocated for `CREATE SERVER`. (Bug #34789)
- Debugging symbols were missing for some executables in Windows binary distributions. (Bug #35104)
- A server crash could occur if `INFORMATION_SCHEMA` tables built in memory were swapped out to disk during query execution. (Bug #34529)
- `mysql-stress-test.pl` and `mysqld_multi.server.sh` were missing from some binary distributions. (Bug #21023, Bug #25486)
- The parser rules for the `SHOW PROFILE` statement were revised to work with older versions of `bison`. (Bug #27433)
- The MySQL Instance Configuration Wizard would not permit you to choose a service name, even though the criteria for the service name were valid. The code that checks the name has been updated to support the correct criteria of any string less than 256 character and not containing either a forward or backward slash character. (Bug #27013)
- The XPath `boolean()` function did not cast string and nodeset values correctly in some cases. It now returns `TRUE` for any nonempty string or nodeset and 0 for a `NULL` string, as specified in the XPath standard.. (Bug #26051)
- Memory corruption, a crash of the MySQL server, or both, could take place if a low-level I/O error occurred while an `ARCHIVE` table was being opened. (Bug #26978)
- The `BENCHMARK()` [1032] function, invoked with more than 2147483648 iterations (the size of a signed 32-bit integer), terminated prematurely. (Bug #20752)
- The SQL parser did not accept an empty `UNION=()` clause. This meant that, when there were no underlying tables specified for a `MERGE` table, `SHOW CREATE TABLE` and `mysqldump` both output statements that could not be executed.

  Now it is possible to execute a `CREATE TABLE` or `ALTER TABLE` statement with an empty `UNION=()` clause. However, `SHOW CREATE TABLE` and `mysqldump` do not output the `UNION=()` clause if there are no underlying tables specified for a `MERGE` table. This also means it is now possible to remove the underlying tables for a `MERGE` table using `ALTER TABLE ... UNION=()`. (Bug #28248)
- It was possible to exhaust memory by repeatedly running `index_merge` [697] queries and never performing any `FLUSH TABLES` statements. (Bug #27732)
- When `utf8` was set as the connection character set, using `SPACE()` [957] with a non-Unicode column produced an error. (Bug #27580)

  References: See also Bug #23637.
- Attempting to create an index with a prefix on a `DECIMAL` column appeared to succeed with an inaccurate warning message. Now, this action fails with the error `Incorrect prefix key; the`

used key part isn't a string, the used length is longer than the key part, or the storage engine doesn't support unique prefix keys. (Bug #25426)

- CREATE ... SELECT did not always set DEFAULT column values in the new table. (Bug #21380)
- mysqlcheck -A -r did not correctly identify all tables that needed repairing. (Bug #25347)
- resolveip failed to produce correct results for host names that begin with a digit. (Bug #27427)
- Warnings for deprecated syntax constructs used in stored routines make sense to report only when the routine is being created, but they were also being reported when the routine was parsed for loading into the execution cache. Now they are reported only at routine creation time. (Bug #21801)
- mysql_config output did not include -lmygcc on some platforms when it was needed. (Bug #21158)
- mysqlhotcopy silently skipped databases with names consisting of two alphanumeric characters. (Bug #28460)
- mysql did not use its completion table. Also, the table contained few entries. (Bug #24624)
- After stopping and starting the event scheduler, disabled events could remain in the execution queue. (Bug #22738)
- On Mac OS X, mysqld did not react to Control+C when run under gdb, even when run with the --gdb [428] option. (Bug #21567)
- SHOW COLUMNS on a TEMPORARY table caused locking issues. (Bug #23588)
- The client library had no way to return an error if no connection had been established. This caused problems such as mysql_library_init() failing silently if no errmsg.sys file was available. (Bug #25097)
- For upgrading to a new major version using RPM packages (such as 4.1 to 5.0), if the installation procedure found an existing MySQL server running, it could fail to shut down the old server, but also erroneously removed the server's socket file. Now the procedure checks for an existing server package from a different vendor or major MySQL version. In such case, it refuses to install the server and recommends how to safely remove the old packages before installing the new ones. (Bug #28555)
- No information was written to the general query log for the COM_STMT_CLOSE, COM_STMT_RESET, and COM_STMT_SEND_LONG_DATA commands. (These occur when a client invokes the mysql_stmt_close(), mysql_stmt_reset() and mysql_stmt_send_long_data() C API functions.) (Bug #28386)
- For views or stored programs created with an invalid DEFINER value, the error message was confusing (did not tie the problem to the DEFINER clause) and has been improved. (Bug #21854)
- The Qcache_free_blocks [566] status variable did not display a value of 0 if the query cache was disabled. (Bug #25132)
- The server produced a confusing error message when attempting to open a table that required a storage engine that was not loaded. (Bug #22708)
- Logging of statements to log tables was incorrect for statements that contained utf8-incompatible binary strings. Incompatible sequences are hex-encoded now. (Bug #23924)
- When symbolic links were disabled, either with a server startup option or by enabling the NO_DIR_IN_CREATE [573] SQL mode, CREATE TABLE silently ignored the DATA DIRECTORY and INDEX DIRECTORY table options. Now the server issues a warning if symbolic links are disabled when these table options are used. (Bug #25677)
- For distributions compiled with the bundled libedit library, there were difficulties using the mysql client to enter input for non-ASCII or multi-byte characters. (Bug #23097)

- On Windows, for distributions built with debugging support, `mysql` could crash if the user typed **Control+C**. (Bug #26243)
- In `ORDER BY` clauses, mixing aggregate functions and nongrouping columns is not permitted if the `ONLY_FULL_GROUP_BY` [575] SQL mode is enabled. However, in some cases, no error was thrown because of insufficient checking. (Bug #27219)
- `perror` reported incomplete or inaccurate information. (Bug #23028, Bug #25177)
- `config-win.h` unconditionally defined `bool` as `BOOL`, causing problems on systems where `bool` is 1 byte and `BOOL` is 4 bytes. (Bug #26461)
- On Mac OS X, the StartupItem for MySQL did not work. (Bug #25008)
- The MySQL header files contained some duplicate macro definitions that could cause compilation problems. (Bug #23839)
- For Windows 64-bit builds, enabling shared-memory support caused client connections to fail. (Bug #24992)
- On Windows, an error in `configure.js` caused installation of source distributions to fail. (Bug #25340)
- `DROP DATABASE` failed for attempts to drop databases with names that contained the legacy `#mysql50#` name prefix. (Bug #26703)
- The `FEDERATED` storage engine did not perform identifier quoting for column names that are reserved words when sending statements to the remote server. (Bug #28269)
- If a user installed MySQL Server and set a password for the `root` user, and then uninstalled and reinstalled MySQL Server to the same location, the user could not use the MySQL Instance Config wizard to configure the server because the uninstall operation left the previous data directory intact. The config wizard *assumed* that any new install (not an upgrade) would have the default data directory where the `root` user has no password. The installer now writes a registry key named `FoundExistingDataDir`. If the installer finds an existing data directory, the key will have a value of 1, otherwise it will have a value of 0. When `MySQLInstanceConfig.exe` is run, it will attempt to read the key. If it can read the key, and the value is 1 and there is no existing instance of the server (indicating a new installation), the Config Wizard will permit the user to input the old password so the server can be configured. (Bug #24215)
- For the `--record_log_pos` [364] option, `mysqlhotcopy` now determines the slave status information from the result of `SHOW SLAVE STATUS` by using the `Relay_Master_Log_File` and `Exec_Master_Log_Pos` values rather than the `Master_Log_File` and `Read_Master_Log_Pos` values. This provides a more accurate indication of slave execution relative to the master. (Bug #27101)
- A `SET` column whose definition specified 64 elements could not be updated using integer values. (Bug #15409)
- `CREATE TABLE` permitted 0 as the default value for a `TIMESTAMP` column when the server was running in `NO_ZERO_DATE` [575] mode. (Bug #18834)
- If a `SELECT` calls a stored function in a transaction, and a statement within the function fails, that statement should roll back. Furthermore, if `ROLLBACK` is executed after that, the entire transaction should be rolled back. Before this fix, the failed statement did not roll back when it failed (even though it might ultimately get rolled back by a `ROLLBACK` later that rolls back the entire transaction). (Bug #12713)

  References: See also Bug #34655.
- `DROP DATABASE` did not drop orphaned `FOREIGN KEY` constraints. (Bug #18942)

- `MySQLInstanceConfig.exe` could lose the `innodb_data_home_dir` [1365] setting when reconfiguring an instance. (Bug #19797)
- `mysqldumpslow` returned a confusing error message when no configuration file was found. (Bug #20455)
- The parser incorrectly permitted `SQLSTATE '00000'` to be specified for a condition handler. (This is incorrect because the condition must be a failure condition and `'00000'` indicates success.) (Bug #8759)
- `MySQLInstanceConfig.exe` did not save the `innodb_data_home_dir` [1365] value to the `my.ini` file under certain circumstances. (Bug #6627)

Changes in MySQL 5.1.23 (2008-01-29)

Functionality Added or Changed

- **Important Change**: **Partitioning**: **Security Fix**: It was possible, by creating a partitioned table using the `DATA DIRECTORY` and `INDEX DIRECTORY` options to gain privileges on other tables having the same name as the partitioned table. As a result of this fix, any table-level `DATA DIRECTORY` or `INDEX DIRECTORY` options are now ignored for partitioned tables. (Bug #32091, CVE-2007-5970)

  References: See also Bug #29325, Bug #32111.

- **Incompatible Change**: In MySQL 5.1.6, when log tables were implemented, the default log destination for the general query and slow query log was `TABLE`. This default has been changed to `FILE`, which is compatible with MySQL 5.0, but incompatible with earlier releases of MySQL 5.1 from 5.1.6 to 5.1.20. If you are upgrading from MySQL 5.0 to 5.1.21 or higher, no logging option changes should be necessary. However, if you are upgrading from 5.1.6 through 5.1.20 to 5.1.21 or higher and were using `TABLE` logging, use the `--log-output=TABLE` [431] option explicitly to preserve your server's table-logging behavior.

  The MySQL 5.1.23 fix is in addition to a fix in 5.1.21 because it turned out that the default was set in two places, only one of which was fixed the first time. (Bug #29993)

- **Incompatible Change**

  The parser accepted statements that contained `/* ... */` that were not properly closed with `*/`, such as `SELECT 1 /* + 2`. Statements that contain unclosed `/*`-comments now are rejected with a syntax error.

  This fix has the potential to cause incompatibilities. Because of Bug #26302, which caused the trailing `*/` to be truncated from comments in views, stored routines, triggers, and events, it is possible that objects of those types may have been stored with definitions that now will be rejected as syntactically invalid. Such objects should be dropped and re-created so that their definitions do not contain truncated comments. (Bug #28779)

- **MySQL Cluster**: The following improvements have been made in the `ndb_size.pl` utility:
  - The script can now be used with multiple databases; lists of databases and tables can also be excluded from analysis.
  - Schema name information has been added to index table calculations.
  - The database name is now an optional parameter, the exclusion of which causes all databases to be examined.
  - If selecting from `INFORMATION_SCHEMA` fails, the script now attempts to fall back to `SHOW TABLES`.
  - A `--real_table_name` option has been added; this designates a table to handle unique index size calculations.

- The report title has been amended to cover cases where more than one database is being analyzed.

Support for a `--socket` option was also added.

For more information, see `ndb_size.pl` — NDBCLUSTER Size Requirement Estimator. (Bug #28683, Bug #28253)

- **MySQL Cluster**: Mapping of `NDB` error codes to MySQL storage engine error codes has been improved. (Bug #28423)
- **MySQL Cluster**: The output from the cluster management client showing the progress of data node starts has been improved. (Bug #23354)
- **MySQL Cluster**: The output of the `ndb_mgm` client `SHOW` and `STATUS` commands now indicates when the cluster is in single user mode. (Bug #27999)
- **Partitioning**: Error messages for partitioning syntax errors have been made more descriptive. (Bug #29368)
- **Replication**: Replication of the following SQL functions now switches to row-based logging in `MIXED` mode, and generates a warning in `STATEMENT` mode:
  - `USER()` [1039]
  - `CURRENT_USER()` [1033] and its alias `CURRENT_USER`
  - `FOUND_ROWS()` [1035]
  - `ROW_COUNT()` [1038]

  See Mixed Binary Logging Format, for more information. (Bug #12092, Bug #28086, Bug #30244)
- Server parser performance was improved for identifier lists, expression lists, and UDF expression lists. (Bug #30333)
- Server parser performance was improved for expression parsing by lowering the number of state transitions and reductions needed. (Bug #30625)
- If a `MyISAM` table is created with no `DATA DIRECTORY` option, the `.MYD` file is created in the database directory. By default, if `MyISAM` finds an existing `.MYD` file in this case, it overwrites it. The same applies to `.MYI` files for tables created with no `INDEX DIRECTORY` option. To suppress this behavior, start the server with the new `--keep_files_on_create` option, in which case `MyISAM` will not overwrite existing files and returns an error instead. (Bug #29325)
- Server parser performance was improved for boolean expressions. (Bug #30237)
- `mysqltest` now has a `change_user` command to change the user for the current connection. (It invokes the `mysql_change_user()` C API function.) (Bug #31608)
- `mysql-test-run.pl` now permits a suite name prefix to be specified in command-line arguments that name test cases. The test name syntax now is `[`*`suite_name`*`.]`*`test_name`*`[.`*`suffix`*`]`. For example, `mysql-test-run.pl binlog.mytest` runs the `mytest.test` test in the `binlog` test suite. (Bug #31400)
- `mysqldump` produces a `-- Dump completed on `*`DATE`* comment at the end of the dump if `--comments` [294] is given. The date causes dump files for identical data take at different times to appear to be different. The new options `--dump-date` [296] and `--skip-dump-date` [296] control whether the date is added to the comment. `--skip-dump-date` [296] suppresses date printing. The default is `--dump-date` [296] (include the date in the comment). (Bug #31077)

- `mysqldump` information at the top of the output now shows the same information as `mysqldump` invoked with the `-V` option, namely the `mysqldump` version number, the MySQL server version, and the distribution. (Bug #32350)

- The `--event-scheduler` [474] option without a value disabled the event scheduler. Now it enables the event scheduler. (Bug #31332)

- The `mysql_odbc_escape_string()` C API function has been removed. It has multi-byte character escaping issues, doesn't honor the `NO_BACKSLASH_ESCAPES` [573] SQL mode and is not needed anymore by Connector/ODBC as of 3.51.17. (Bug #29592)

  References: See also Bug #41728.

- The `LAST_EXECUTED` column of the `INFORMATION_SCHEMA.EVENTS` table now indicates when the event started executing rather than when it finished executing. As a result, the `ENDS` column is never less than `LAST_EXECUTED`. (Bug #29830)

- `SHOW COLUMNS` now returns `NULL` instead of the empty string for the `Default` value of columns that have no `DEFAULT` clause specified. (Bug #27747)

- The default value of the `connect_timeout` [468] system variable was increased from 5 to 10 seconds. This might help in cases where clients frequently encounter errors of the form `Lost connection to MySQL server at 'XXX', system error: errno`. (Bug #28359)

- MySQL now can be compiled with `gcc` 4.2.x. There was a problem involving a conflict with the `min()` and `max()` macros in `my_global.h`. (Bug #28184)

- The argument for the `mysql-test-run.pl --do-test` and `--skip-test` options is now interpreted as a Perl regular expression if there is a pattern metacharacter in the argument value. This enables more flexible specification of which tests to perform or skip.

- `mysql-test-run.pl` now supports a `--combination` option for specifying options to the `mysqld` server. This option is similar to `--mysqld` but should be given two or more times. `mysql-test-run.pl` executes multiple test runs, using the options for each instance of `--combination` in successive runs.

  For test runs specific to a given test suite, an alternative to the use of `--combination` is to create a `combinations` file in the suite directory. The file should contain a section of options for each test run.

Bugs Fixed

- **Security Fix**: **Replication**: It was possible for any connected user to issue a `BINLOG` statement, which could be used to escalate privileges.

  Use of the `BINLOG` statement now requires the `SUPER` [628] privilege. (Bug #31611, CVE-2007-6313)

- **Security Fix**: Using `RENAME TABLE` against a table with explicit `DATA DIRECTORY` and `INDEX DIRECTORY` options can be used to overwrite system table information by replacing the symbolic link points. the file to which the symlink points.

  MySQL will now return an error when the file to which the symlink points already exists. (Bug #32111, CVE-2007-5969)

- **Security Fix**: When using a `FEDERATED` table, the local server could be forced to crash if the remote server returned a result with fewer columns than expected. (Bug #29801)

- **Security Fix**: `ALTER VIEW` retained the original `DEFINER` value, even when altered by another user, which could enable that user to gain the access rights of the view. Now `ALTER VIEW` is permitted only to the original definer or users with the `SUPER` [628] privilege. (Bug #29908)

- **Security Fix**: Three vulnerabilities in yaSSL versions 1.7.5 and earlier were discovered that could lead to a server crash or execution of unauthorized code. The exploit requires a server with yaSSL enabled and TCP/IP connections enabled, but does not require valid MySQL account credentials. The exploit does not apply to OpenSSL.

  Warning

  The proof-of-concept exploit is freely available on the Internet. Everyone with a vulnerable MySQL configuration is advised to upgrade *immediately*.

  (Bug #33814, CVE-2008-0226, CVE-2008-0227)

- **Security Enhancement**: It was possible to force an error message of excessive length which could lead to a buffer overflow. This has been made no longer possible as a security precaution. (Bug #32707)

- **Performance**: If a `LIMIT` clause was present, the server could fail to consider indexes that could be used for `ORDER BY` or `GROUP BY`. (Bug #28404)

- **Incompatible Change**: Multiple-table `DELETE` statements containing ambiguous aliases could have unintended side effects such as deleting rows from the wrong table. Examples:

  ```
  DELETE FROM t1 AS a2 USING t1 AS a1 INNER JOIN t2 AS a2;
  DELETE t1 AS a2 FROM t1 AS a1 INNER JOIN t2 AS a2;
  ```

  To avoid ambiguity, declaration of aliases other than in the *`table_references`* part of the statement should be avoided:

  ```
  DELETE FROM t1 USING t1 AS a1 INNER JOIN t2 AS a2;
  DELETE t1 FROM t1 AS a1 INNER JOIN t2 AS a2;
  ```

  For the `USING` variant of multiple-table `DELETE` syntax, alias declarations outside the *`table_references`* part of the statement now are disallowed. (In MySQL 5.5, alias declarations outside *`table_references`* are disallowed for all multiple-table `DELETE` statements.) Statements containing aliases that are no longer permitted must be rewritten. (Bug #30234)

  References: See also Bug #27525.

- **Incompatible Change**: Inserting a row with a `NULL` value for a `DATETIME` column results in a `CSV` file that the storage engine cannot read.

  All `CSV` tables now need to be defined with each column marked as `NOT NULL`. An error is raised if you try to create a `CSV` table with columns that are not defined with `NOT NULL`. (Bug #31473, Bug #32817)

- **Incompatible Change**: Within a stored routine, it is no longer permissible to declare a cursor for a `SHOW` or `DESCRIBE` statement. This happened to work in some instances, but is no longer supported. In many cases, a workaround for this change is to use the cursor with a `SELECT` query to read from an `INFORMATION_SCHEMA` table that produces the same information as the `SHOW` statement. (Bug #29223)

- **Incompatible Change**: `SET PASSWORD` statements now cause an implicit commit, and thus are prohibited within stored functions and triggers. (Bug #30904)

- **Incompatible Change**: With `ONLY_FULL_GROUP_BY` [575] SQL mode enabled, queries such as `SELECT a FROM t1 HAVING COUNT(*)>2` were not being rejected as they should have been.

  This fix results in the following behavior:

  - There is a check against mixing group and nongroup columns *only* when `ONLY_FULL_GROUP_BY` [575] is enabled.
  - This check is done both for the select list and for the `HAVING` clause if there is one.

This behavior differs from previous versions as follows:

- Previously, the `HAVING` clause was not checked when `ONLY_FULL_GROUP_BY` [575] was enabled; now it is checked.
- Previously, the select list was checked even when `ONLY_FULL_GROUP_BY` [575] was not enabled; now it is checked only when `ONLY_FULL_GROUP_BY` [575] is enabled.

(Bug #31794)

- **Incompatible Change**: It is no longer possible to create `CSV` tables with `NULL` columns. However, for backward compatibility, you can continue to use such tables that were created in previous MySQL releases. (Bug #32050)
- **Incompatible Change**: The `mysql_install_db` script could fail to locate some components (including `resolveip`) during execution if the `--basedir` [253] option was specified on the command-line or within the `my.cnf` file. This was due to a conflict when comparing the compiled-in values and the supplied values.

  The `--source-install` command-line option to the script has been removed and replaced with the `--srcdir` option. `mysql_install_db` now locates components either using the compiled-in options, the `--basedir` [253] option or `--srcdir` [253] option. (Bug #30759)
- **Incompatible Change**: It was possible to create a view having a column whose name consisted of an empty string or space characters only.

  One result of this bug fix is that aliases for columns in the view `SELECT` statement are checked to ensure that they are legal column names. In particular, the length must be within the maximum column length of 64 characters, not the maximum alias length of 256 characters. This can cause problems for replication or loading dump files. For additional information and workarounds, see Restrictions on Views. (Bug #27695)

  References: See also Bug #31202.
- **Incompatible Change**: `GRANT` and `REVOKE` statements now cause an implicit commit, and thus are prohibited within stored functions and triggers. (Bug #21975, Bug #21422, Bug #17244)
- **Incompatible Change**: Several type-preserving functions and operators returned an incorrect result type that does not match their argument types: `COALESCE()` [941], `IF()` [947], `IFNULL()` [947], `LEAST()` [943], `GREATEST()` [942], `CASE` [946]. These now aggregate using the precise SQL types of their arguments rather than the internal type. In addition, the result type of the `STR_TO_DATE()` [991] function is now `DATETIME` by default. (Bug #27216)
- **Incompatible Change**: It was possible for option files to be read twice at program startup, if some of the standard option file locations turned out to be the same directory. Now duplicates are removed from the list of files to be read.

  Also, users could not override system-wide settings using `~/.my.cnf` because *`SYSCONFDIR/`*`my.cnf` was read last. The latter file now is read earlier so that `~/.my.cnf` can override system-wide settings.

  The fix for this problem had a side effect such that on Unix, MySQL programs looked for options in `~/my.cnf` rather than the standard location of `~/.my.cnf`. That problem was addressed as Bug #38180. (Bug #20748)
- **Incompatible Change**: A number of problems existed in the implementation of `MERGE` tables that could cause problems. The problems are summarized below:
  - Bug #26379: Combination of `FLUSH TABLE` and `REPAIR TABLE` corrupts a `MERGE` table. This was caused in a number of situations:

1. A thread trying to lock a `MERGE` table performs busy waiting while `REPAIR TABLE` or a similar table administration task is ongoing on one or more of its `MyISAM` tables.

2. A thread trying to lock a `MERGE` table performs busy waiting until all threads that did `REPAIR TABLE` or similar table administration tasks on one or more of its `MyISAM` tables in `LOCK TABLES` segments do `UNLOCK TABLES`. The difference against problem #1 is that the busy waiting takes place after the administration task. It is terminated by `UNLOCK TABLES` only.

3. Two `FLUSH TABLES` within a `LOCK TABLES` segment can invalidate the lock. This does not require a `MERGE` table. The first `FLUSH TABLES` can be replaced by any statement that requires other threads to reopen the table. In 5.0 and 5.1 a single `FLUSH TABLES` can provoke the problem.

- Bug #26867: Simultaneously executing `LOCK TABLES` and `REPAIR TABLE` on a `MERGE` table would result in memory/cpu hogging.

  Trying DML on a `MERGE` table, which has a child locked and repaired by another thread, made an infinite loop in the server.

- Bug #26377: Deadlock with `MERGE` and `FLUSH TABLE`

  Locking a `MERGE` table and its children in parent-child order and flushing the child deadlocked the server.

- Bug #25038: Waiting `TRUNCATE TABLE`

  Truncating a `MERGE` child, while the `MERGE` table was in use, let the truncate fail instead of waiting for the table to become free.

- Bug #25700: `MERGE` base tables get corrupted by `OPTIMIZE TABLE`, `ANALYZE TABLE`, or `REPAIR TABLE`.

  Repairing a child of an open `MERGE` table corrupted the child. It was necessary to `FLUSH` the child first.

- Bug #30275: `MERGE` tables: `FLUSH TABLES` or `UNLOCK TABLES` causes server to crash.

  Flushing and optimizing locked `MERGE` children crashed the server.

- Bug #19627: temporary merge table locking

  Use of a temporary `MERGE` table with nontemporary children could corrupt the children.

  Temporary tables are never locked. Creation of tables with nontemporary children of a temporary `MERGE` table is now prohibited.

- Bug #27660: `Falcon`: `MERGE` table possible

  It was possible to create a `MERGE` table with non-`MyISAM` children.

- Bug #30273: `MERGE` tables: Can't lock file (errno: 155)

  This was a Windows-only bug. Table administration statements sometimes failed with "Can't lock file (errno: 155)".

The fix introduces the following changes in behavior:

- This patch changes the behavior of temporary `MERGE` tables. Temporary `MERGE` must have temporary children. The old behavior was wrong. A temporary table is not locked. Hence even nontemporary children were not locked. See Bug #19627.

- You cannot change the union list of a nontemporary `MERGE` table when `LOCK TABLES` is in effect. The following does *not* work:

```
CREATE TABLE m1 ... ENGINE=MRG_MYISAM ...;
LOCK TABLES t1 WRITE, t2 WRITE, m1 WRITE;
ALTER TABLE m1 ... UNION=(t1,t2) ...;
```

  However, you can do this with a temporary `MERGE` table.

- You cannot create a `MERGE` table with `CREATE ... SELECT`, neither as a temporary `MERGE` table, nor as a nontemporary `MERGE` table. For example, `CREATE TABLE m1 ... ENGINE=MRG_MYISAM ... SELECT ...;` causes the error message: `table is not BASE TABLE`.

(Bug #19627, Bug #25038, Bug #25700, Bug #26377, Bug #26379, Bug #26867, Bug #27660, Bug #30275, Bug #30491)

- **Important Change**: **MySQL Cluster**: `AUTO_INCREMENT` columns had the following problems when used in `NDB` tables:

  - The `AUTO_INCREMENT` counter was not updated correctly when such a column was updated.
  - `AUTO_INCREMENT` values were not prefetched beyond statement boundaries.
  - `AUTO_INCREMENT` values were not handled correctly with `INSERT IGNORE` statements.
  - After being set, `ndb_autoincrement_prefetch_sz` [1921] showed a value of 1, regardless of the value it had actually been set to.

  As part of this fix, the behavior of `ndb_autoincrement_prefetch_sz` [1921] has changed. Setting this to less than 32 no longer has any effect on prefetching within statements (where IDs are now always obtained in batches of 32 or more), but only between statements. The default value for this variable has also changed, and is now `1`. (Bug #25176, Bug #31956, Bug #32055)

- **Partitioning**: **Important Note**: An apostrophe or single quote character (`'`) used in the `DATA DIRECTORY`, `INDEX DIRECTORY`, or `COMMENT` for a `PARTITION` clause caused the server to crash. When used as part of a `CREATE TABLE` statement, the crash was immediate. When used in an `ALTER TABLE` statement, the crash did not occur until trying to perform a `SELECT` or DML statement on the table. In either case, the server could not be completely restarted until the `.frm` file corresponding to the newly created or altered table was deleted.

  Note

  Upgrading to the current (or later) release solves this problem only for tables that are newly created or altered. Tables created or altered in previous versions of the server to include `'` characters in `PARTITION` options must still be removed by deleting the corresponding `.frm` files and re-creating them afterward.

  (Bug #30695)

- **Important Note**: The `RENAME DATABASE` statement was removed and replaced with `ALTER DATABASE db_name UPGRADE DATA DIRECTORY NAME`. The `RENAME DATABASE` statement was intended for upgrading database directory names to the encoding format used in 5.1 for representing identifiers in the file system (see Mapping of Identifiers to File Names). However, the statement was found to be dangerous because it could result in loss of database contents. See `RENAME DATABASE` Syntax, and `ALTER DATABASE` Syntax. (Bug #17565, Bug #21741, Bug #28360)

- **Replication**: **MySQL Cluster**: Row-based replication from or to a big-endian machine where the table used the `NDB` storage engine failed, if the same table on the other machine was either non-`NDB` or the other machine was little-endian. (Bug #29549, Bug #30790)

References: See also Bug #24231, Bug #30024, Bug #30133, Bug #30134.

- **MySQL Cluster**: The failure of a master node could lead to subsequent failures in local checkpointing. (Bug #32160)
- **MySQL Cluster**: High numbers of API nodes on a slow or congested network could cause connection negotiation to time out prematurely, leading to the following issues:
  - Excessive retries
  - Excessive CPU usage
  - Partially connected API nodes

  (Bug #32359)
- **MySQL Cluster**: A local checkpoint could sometimes be started before the previous LCP was restorable from a global checkpoint. (Bug #32519)
- **MySQL Cluster**: The `NDB` storage engine code was not safe for strict-alias optimization in `gcc` 4.2.1. (Bug #31761)
- **MySQL Cluster**: An error with an `if` statement in `sql/ha_ndbcluster.cc` could potentially lead to an infinite loop in case of failure when working with `AUTO_INCREMENT` columns in `NDB` tables. (Bug #31810)
- **MySQL Cluster**: Reads on `BLOB` columns were not locked when they needed to be to guarantee consistency. (Bug #29102)

  References: See also Bug #31482.
- **MySQL Cluster**: It was possible in some cases for a node group to be “lost” due to missed local checkpoints following a system restart. (Bug #31525)
- **MySQL Cluster**: A node failure during a local checkpoint could lead to a subsequent failure of the cluster during a system restart. (Bug #31257)
- **MySQL Cluster**: A query using joins between several large tables and requiring unique index lookups failed to complete, eventually returning `Unknown Error` after a very long period of time. This occurred due to inadequate handling of instances where the Transaction Coordinator ran out of `TransactionBufferMemory` [1823], when the cluster should have returned NDB error code 4012 (`Request ndbd time-out`). (Bug #28804)
- **MySQL Cluster**: An interpreted program of sufficient size and complexity could cause all cluster data nodes to shut down due to buffer overruns. (Bug #29390)
- **MySQL Cluster**: When handling `BLOB` columns, the addition of read locks to the lock queue was not handled correctly. (Bug #30764)
- **MySQL Cluster**: `ndb_mgm --help` did not display any information about the `-a` option. (Bug #29509)
- **MySQL Cluster**: `NDB` tables having names containing nonalphanumeric characters (such as “`$`”) were not discovered correctly. (Bug #31470)
- **MySQL Cluster**: Discovery of `NDB` tables did not work correctly with `INFORMATION_SCHEMA`. (Bug #30667)
- **MySQL Cluster**: A query against a table with `TEXT` or `BLOB` columns that would return more than a certain amount of data failed with `Got error 4350 'Transaction already aborted' from NDBCLUSTER`. (Bug #31482)

  References: This bug was introduced by Bug #29102.

- **MySQL Cluster**: A file system close operation could fail during a node or system restart. (Bug #30646)
- **MySQL Cluster**: A cluster restart could sometimes fail due to an issue with table IDs. (Bug #30975)
- **MySQL Cluster**: `ndb_size.pl` failed on tables with `FLOAT` columns whose definitions included commas (for example, `FLOAT(6,2)`). (Bug #29228)
- **MySQL Cluster**: Attempting to restore a backup made on a cluster host using one endian to a machine using the other endian could cause the cluster to fail. (Bug #29674)
- **MySQL Cluster**: Transaction timeouts were not handled well in some circumstances, leading to excessive number of transactions being aborted unnecessarily. (Bug #30379)
- **MySQL Cluster**: In some cases, the cluster managment server logged entries multiple times following a restart of `ndb_mgmd`. (Bug #29565)
- **MySQL Cluster**: The management server was slow to respond when no data nodes were connected to the cluster. This was most noticeable when running `SHOW` in the management client. (Bug #32023)
- **MySQL Cluster**: The cluster management client could not connect, and would hang instead. This issue affected Mac OS X 64-bit only. (Bug #30366)
- **MySQL Cluster**: A memory leak occurred if a subscription start request was received by the subscription manager before the node making the request was fully connected to the cluster. (Bug #32652)
- **MySQL Cluster**: Log event requests to `ndb_mgmd` could time out, causing it to fail. (Bug #29621)
- **MySQL Cluster**: The error message for `NDB` error code 275 (`Out of transaction records for complete phase`) was missing. (Bug #29139)
- **MySQL Cluster**: When a `mysqld` acting as a cluster SQL node starts the `NDBCLUSTER` storage engine, there is a delay during which some necessary data structures cannot be initialized until after it has connected to the cluster, and all MySQL Cluster tables should be opened as read only. This worked correctly when the `NDB` binlog thread was running, but when it was not running, Cluster tables were not opened as read only even when the data structures had not yet been set up. (Bug #32275, Bug #33763)
- **MySQL Cluster**: Incorrectly handled parameters could lead to a crash in the Transaction Coordinator during a node failure, causing other data nodes to fail. (Bug #33168)
- **MySQL Cluster**: An improperly reset internal signal was observed as a hang when using events in the `NDB` API but could result in various errors. (Bug #33206)
- **MySQL Cluster**: A restart of the cluster failed when more than 1 REDO phase was in use. (Bug #22696)
- **MySQL Cluster**: Performing `DELETE` operations after a data node had been shut down could lead to inconsistent data following a restart of the node. (Bug #26450)
- **MySQL Cluster**: `UPDATE IGNORE` could sometimes fail on `NDB` tables due to the use of unitialized data when checking for duplicate keys to be ignored. (Bug #25817)
- **MySQL Cluster**: When inserting a row into an `NDB` table with a duplicate value for a nonprimary unique key, the error issued would reference the wrong key.

  This improves on an initial fix for this issue made in MySQL 5.1.13. (Bug #21072)
- **MySQL Cluster**: Restoring a backup made on a cluster host using one endian to a machine using the other endian failed for `BLOB` and `DATETIME` columns. (Bug #27543, Bug #30024)
- **MySQL Cluster**: An invalid subselect on an `NDB` table could cause `mysqld` to crash. (Bug #27494)

- **MySQL Cluster**: An attempt to perform a `SELECT ... FROM INFORMATION_SCHEMA.TABLES` whose result included information about `NDB` tables for which the user had no privileges crashed the MySQL Server on which the query was performed. (Bug #26793)

- **MySQL Cluster**: The description of the `--print` option provided in the output from `ndb_restore --help` was incorrect. (Bug #27683)

- **MySQL Cluster**: The cluster log was formatted inconsistently and contained extraneous newline characters. (Bug #25064)

- **MySQL Cluster**: There was a short interval during the startup process prior to the beginning of heartbeat detection such that, were an API or management node to reboot or a network failure to occur, data nodes could not detect this, with the result that there could be a lingering connection. (Bug #28445)

- **MySQL Cluster**: An insufficiently descriptive and potentially misleading Error 4006 (`Connect failure - out of connection objects...`) was produced when either of the following two conditions occurred:

  1. There were no more transaction records in the transaction coordinator

  2. An `NDB` object in the NDB API was initialized with insufficient parallelism

  Separate error messages are now generated for each of these two cases. (Bug #11313)

- **Partitioning**: **Replication**: Replication of partitioned tables using the `InnoDB` storage engine failed with `binlog-format=ROW` [419] or `binlog-format=MIXED` [419]. (Bug #28430)

- **Partitioning**: Repeated updates of a table that was partitioned by `KEY` on a `TIMESTAMP` column eventually crashed the server. (Bug #32067)

- **Partitioning**: Using `ALTER TABLE` to partition an existing table having an `AUTO_INCREMENT` column could crash the server. (Bug #30878)

  References: This bug was introduced by Bug #27405.

- **Partitioning**: Changing the storage engine used by a table having subpartitions led to a server crash. (Bug #31893)

- **Partitioning**: Selecting from a table partitioned by `KEY` on a `VARCHAR` column whose size was greater than 65530 caused the server to crash. (Bug #31705)

- **Partitioning**: `INSERT DELAYED` on a partitioned table crashed the server. The server now rejects the statement with an error. (Bug #31210)

- **Partitioning**: An error in the internal function `mysql_unpack_partition()` led to a fatal error in subsequent calls to `open_table_from_share()`. (Bug #32158)

- **Partitioning**: `ORDER BY ... DESC` did not always work correctly when selecting from partitioned tables. (Bug #31890)

  References: See also Bug #31001.

- **Partitioning**: `SHOW CREATE TABLE` misreported the value of `AUTO_INCREMENT` for partitioned tables using either of the `InnoDB` or `ARCHIVE` storage engines. (Bug #32247)

- **Partitioning**: A query of the form `SELECT col1 FROM table GROUP BY (SELECT col2 FROM table LIMIT 1);` against a partitioned `table` having a `SET` column crashed the server. (Bug #32772)

- **Partitioning**: Selecting from `INFORMATION_SCHEMA.PARTITIONS` while partition management statements (for example, `ALTER TABLE ... ADD PARTITION`) were executing caused the server to crash. (Bug #32178)

- **Partitioning**: `ALTER TABLE ... COALESCE PARTITION` on a table partitioned by `[LINEAR] HASH` or `[LINEAR] KEY` caused the server to crash. (Bug #30822)
- **Partitioning**: It was not possible to insert the greatest possible value for a given data type into a partitioned table. For example, consider a table defined as shown here:

```
CREATE TABLE t (c BIGINT UNSIGNED)
    PARTITION BY RANGE(c) (
      PARTITION p0 VALUES LESS THAN MAXVALUE
    );
```

  The largest possible value for a `BIGINT UNSIGNED` column is 18446744073709551615, but the statement `INSERT INTO t VALUES (18446744073709551615);` would fail, even though the same statement succeeded were `t` not a partitioned table.

  In other words, `MAXVALUE` was treated as being equal to the greatest possible value, rather than as a least upper bound. (Bug #29258)
- **Partitioning**: `LIKE` queries on tables partitioned by `KEY` and using third-party storage engines could return incomplete results. (Bug #30480)

  References: See also Bug #29320, Bug #29493, Bug #30563.
- **Partitioning**: It was possible to partition a table to which a foreign key referred. (Bug #32948)
- **Cluster Replication**: **Replication**: Incorrect handling of `INSERT` plus `DELETE` operations with regard to local checkpoints caused data node failures in multi-master replication setups. (Bug #30914)
- **Cluster Replication**: **Replication**: A node failure during replication could lead to buckets out of order; now active subscribers are checked for, rather than empty buckets. (Bug #31701)
- **Replication**: It was possible for the name of the relay log file to exceed the amount of memory reserved for it, possibly leading to a crash of the server. (Bug #31836)

  References: See also Bug #28597.
- **Replication**: One thread could read uninitialized memory from the stack of another thread. This issue was only known to occur in a `mysqld` process acting as both a master and a slave. (Bug #30752)
- **Replication**: Corruption of log events caused the server to crash on 64-bit Linux systems having 4 GB or more of memory. (Bug #31793)
- **Replication**: When dropping a database containing a stored procedure while using row-cased replication, the delete of the stored procedure from the `mysql.proc` table was recorded in the binary log following the `DROP DATABASE` statement. To correct this issue, `DROP DATABASE` now uses statement-based replication. (Bug #32435)
- **Replication**: Trying to replicate an update of a row that was missing on the slave led to a failure on the slave. (Bug #31702)
- **Replication**: Table names were displayed as binary “garbage” characters in slave error messages. The issue was observed on 64-bit Windows but may have effected other platforms. (Bug #30854)
- **Replication**: Use of the `@@hostname` system variable in inserts in `mysql_system_tables_data.sql` did not replicate. The workaround is to select its value into a user variable (which does replicate) and insert that. (Bug #31167)
- **Replication**: Issuing `SHOW SLAVE STATUS` as `mysqld` was shutting down could cause a crash. (Bug #26000)
- **Replication**: If a temporary error occurred inside an event group on an event that was not the first event of the group, the slave could get caught in an endless loop because the retry counter was reset whenever an event was executed successfully. (Bug #24860)

References: See also Bug #12691, Bug #23171.

- **Replication**: An `UPDATE` statement using a stored function that modified a nontransactional table was not logged if it failed. This caused the copy of the nontransactional table on the master have a row that the copy on the slave did not.

  In addition, when an `INSERT ... ON DUPLICATE KEY UPDATE` statement encountered a duplicate key constraint, but the `UPDATE` did not actually change any data, the statement was not logged. As a result of this fix, such statements are now treated the same for logging purposes as other `UPDATE` statements, and so are written to the binary log. (Bug #23333)

  References: See also Bug #12713.

- **Replication**: It was possible to set `SQL_SLAVE_SKIP_COUNTER` such that the slave would jump into the middle of a transaction. This fix improves on one made for this bug in MySQL 5.1.20; the previous fix insured that the slave could not be made to jump into the middle of an event group, but the slave failed to recognize that `BEGIN`, `COMMIT`, and `ROLLBACK` statements could begin or end an event group. (Bug #28618)

  References: See also Bug #12691.

- **Replication**: Due a previous change in how the default name and location of the binary log file were determined, replication failed following some upgrades. (Bug #28597, Bug #28603)

  References: See also Bug #31836. This bug was introduced by Bug #20166.

- **Replication**: Stored procedures having `BIT` parameters were not replicated correctly. (Bug #26199)

- **Replication**: A replication slave sometimes failed to reconnect because it was unable to run `SHOW SLAVE HOSTS`. It was not necessary to run this statement on slaves (since the master should track connection IDs), and the execution of this statement by slaves was removed. (Bug #21132)

  References: See also Bug #13963, Bug #21869.

- **Replication**: A replication slave sometimes stopped for changes that were idempotent (that is, such changes should have been considered “safe”), even though it should have simply noted that the change was already done, and continued operation. (Bug #19958)

- **Replication**: Replicating from a master table to a slave table where the size of a `CHAR` or `VARCHAR` column was a different size would cause `mysqld` to crash. For more information on replicating with different column definitions, see Replication with Differing Table Definitions on Master and Slave.

- **Cluster Replication**: Under certain conditions, the slave stopped processing relay logs. This resulted in the logs never being cleared and the slave eventually running out of disk space. (Bug #31958)

- **Cluster Replication**: When the master `mysqld` crashed or was restarted, no `LOST_EVENTS` entry was made in the binlog. (Bug #31484)

  References: See also Bug #21494.

- **Cluster Replication**: An issue with the `mysql.ndb_apply_status` table could cause `NDB` schema autodiscovery to fail in certain rare circumstances. (Bug #20872)

- **Cluster Replication**: Replicating `NDB` tables with extra `VARCHAR` columns on the master caused the slave to fail. (Bug #31646)

  References: See also Bug #29549.

- **Cluster Replication**: A replication slave could return “garbage” data that was not in recognizable row format due to a problem with the internal `all_set()` method. (Bug #33375)

- **Cluster Replication**: Memory was mistakenly freed for `NdbBlob` objects when adding an index while replicating the cluster, which could cause `mysqld` to crash. (Bug #33142)

  References: See also Bug #18106.

- **Cluster API**: A call to `CHECK_TIMEDOUT_RET()` in `mgmapi.cpp` should have been a call to `DBUG_CHECK_TIMEDOUT_RET()`. (Bug #30681)

- **API**: When the language option was not set correctly, API programs calling `mysql_server_init()` crashed. This issue was observed only on Windows platforms. (Bug #31868)

- Corrected a typecast involving `bool` on Mac OS X 10.5 (Leopard), which evaluated differently from earlier Mac OS X versions. (Bug #38217)

- `ORDER BY UpdateXML(...)` caused the server to crash in queries where `UpdateXML()` [1018] returned `NULL`. (Bug #32557)

- When loading a dynamic plugin on FreeBSD, the plugin would fail to load. This was due to a build error where the required symbols would be not exported correctly. (Bug #30296)

- Issuing an `ALTER SERVER` statement to update the settings for a `FEDERATED` server would cause the `mysqld` to crash. (Bug #30671)

- Starting the server using `--read-only` [517] and with the Event Scheduler enabled caused it to crash.

  Note

  This issue occurred only when the server had been built with certain nonstandard combinations of `configure` options.

  (Bug #31111)

- Executing a `SELECT COUNT(*)` query on an `InnoDB` table partitioned by `KEY` that used a `DOUBLE` column as the partitioning key caused the server to crash. (Bug #30583)

- A self-referencing trigger on a partitioned table caused the server to crash instead of failing with an error. (Bug #30484)

- When `mysqlslap` was given a query to execute from a file using a `--query=file_name` [319] option, it executed the query one too many times. (Bug #29803)

- `GROUP BY` on `BIT` columns produced incorrect results. (Bug #30219)

- Using `DISTINCT` or `GROUP BY` on a `BIT` column in a `SELECT` statement caused the column to be cast internally as an integer, with incorrect results being returned from the query. (Bug #30245)

- Killing an SSL connection on platforms where MySQL is compiled with `-DSIGNAL_WITH_VIO_CLOSE` (Windows, Mac OS X, and some others) could crash the server. (Bug #28812)

- Issuing a `DELETE` statement having both an `ORDER BY` clause and a `LIMIT` clause could cause `mysqld` to crash. (Bug #30385)

- The `mysqld_safe` script contained a syntax error. (Bug #30624)

- Statements within stored procedures ignored the value of the `low_priority_updates` [491] system variable. (Bug #29963)

  References: See also Bug #26162.

- `mysqldump --skip-events` [296] `--all-databases` [294] dumped data from the `mysqld.event` table, and when restoring from this dump, events were created in spite of the `--skip-events` [296] option. (Bug #29938)
- It was possible when creating a partitioned table using `CREATE TABLE ... SELECT` to refer in the `PARTITION BY` clause to columns in the table being selected from, which could cause the server to crash. An example of such a statement is:

```
CREATE TABLE t1 (b INT)
PARTITION BY RANGE(t2.b) (
    PARTITION p1 VALUES LESS THAN (10),
    PARTITION p2 VALUES LESS THAN (20)
)   SELECT * FROM t2;
```

  The fix is to disallow references in `PARTITION BY` clauses to columns not in the table being created. (Bug #29444)
- With auto-reconnect enabled, row fetching for a prepared statement could crash after reconnect occurred because loss of the statement handler was not accounted for. (Bug #29948)
- The `UpdateXML()` [1018] function did not check for the validity of all its arguments; in some cases, this could lead to a crash of the server. (Bug #31438)
- A failed `HANDLER ... READ` operation could leave the table in a locked state. (Bug #30632)
- The query cache does not support retrieval of statements for which column level access control applies, but the server was still caching such statements, thus wasting memory. (Bug #30269)
- `SHOW STATUS LIKE 'Ssl_cipher_list'` from a MySQL client connected using SSL returned an empty string rather than a list of available ciphers. (Bug #30593)
- Transactions were committed prematurely when `LOCK TABLE` and `SET autocommit = 0` were used together. (Bug #30996)
- If a view used a function in its `SELECT` statement, the columns from the view were not inserted into the `INFORMATION_SCHEMA.COLUMNS` table. (Bug #29408)
- On Windows, `LIMIT` arguments greater than 2^{32} did not work correctly. (Bug #30639)
- On Windows, the `pthread_mutex_trylock()` implementation was incorrect. (Bug #30992)
- On Windows, the `pthread_mutex_trylock()` implementation was incorrect. One symptom was that invalidating the query cache could cause a server crash. (Bug #30768)
- For `MEMORY` tables, `DELETE` statements that remove rows based on an index read could fail to remove all matching rows. (Bug #30590)
- A server crash could occur when a non-`DETERMINISTIC` stored function was used in a `GROUP BY` clause. (Bug #31035)
- Executing `RENAME` while tables were open for use with `HANDLER` statements could cause a server crash. (Bug #31409)
- With small values of `myisam_sort_buffer_size` [503], `REPAIR TABLE` for `MyISAM` tables could cause a server crash. (Bug #31174)
- Internal conversion routines could fail for several multi-byte character sets (`big5`, `cp932`, `euckr`, `gb2312`, `sjis`) for empty strings or during evaluation of `SOUNDS LIKE` [957]. (Bug #31069, Bug #31070)
- Allocation of an insufficiently large group-by buffer following creation of a temporary table could lead to a server crash. (Bug #31249)
- Queries that had a `GROUP BY` clause and selected `COUNT(DISTINCT bit_column)` [1045] returned incorrect results. (Bug #30324)

- When `mysqldump` wrote `DROP DATABASE` statements within version-specific comments, it included the terminating semicolon in the wrong place, causing following statements to fail when the dump file was reloaded. (Bug #30126)
- The `Last_query_cost` [566] status variable value can be computed accurately only for simple “flat” queries, not complex queries such as those with subqueries or `UNION`. However, the value was not consistently being set to 0 for complex queries. (Bug #30377)
- The optimization that uses a unique index to remove `GROUP BY` did not ensure that the index was actually used, thus violating the `ORDER BY` that is implied by `GROUP BY`. (Bug #30596)
- The fix for Bug #24989 introduced a problem such that a `NULL` thread handler could be used during a rollback operation. This problem is unlikely to be seen in practice. (Bug #31517)
- Specifying the `--without-geometry` option for `configure` caused server compilation to fail. (Bug #29972)
- NDB libraries and include files were missing from some binary `tar` file distributions. (Bug #31414)
- The server crashed if a thread was killed while locking the `general_log` [477] table at the beginning of statement processing. (Bug #31692)
- Values for the `--tc-heuristic-recover` option incorrectly were treated as values for the `--myisam-stats-method` option. (Bug #30821)
- For `MEMORY` tables, lookups for `NULL` values in `BTREE` indexes could return incorrect results. (Bug #30885)
- Versions of `mysqldump` from MySQL 4.1 or higher tried to use `START TRANSACTION WITH CONSISTENT SNAPSHOT` if the `--single-transaction` [301] and `--master-data` [298] options were given, even with servers older than 4.1 that do not support consistent snapshots. (Bug #30444)
- The `mysql_change_user()` C API function caused advisory locks (obtained with `GET_LOCK()` [1040]) to malfunction. (Bug #31418)
- User-supplied names foreign key names might not be set to the right key, leading to foreign keys with no name. (Bug #30747)
- `CONVERT(val, DATETIME)` [1012] would fail on invalid input, but processing was not aborted for the `WHERE` clause, leading to a server crash. (Bug #31253)
- Use of `GROUP_CONCAT(DISTINCT bit_column)` [1046] caused an assertion failure. (Bug #31154)
- The embedded server did not properly check column-level privileges. (Bug #30710)
- `mysql-test-run.pl` tried to create files in a directory where it could not be expected to have write permission. `mysqltest` created `.reject` files in a directory other than the one where test results go. (Bug #31398)
- Use of `DECIMAL(n, n) ZEROFILL` in `GROUP_CONCAT()` [1046] could cause a server crash. (Bug #31227)
- The `mysql_change_user()` C API function did not correctly reset the character set variables to the values they had just after initially connecting. (Bug #30472)
- `MAKEDATE()` [989] incorrectly moved year values in the 100 to 200 range into the 1970 to 2069 range. (This is legitimate for 00 to 99, but three-digit years should be used unchanged.) (Bug #30951)
- Short-format `mysql` commands embedded within `/*! ... */` comments were parsed incorrectly by `mysql`, which discarded the rest of the comment including the terminating `*/` characters. The

result was a malformed (unclosed) comment. Now `mysql` does not discard the `*/` characters. (Bug #30164)

- The length of the result from `IFNULL()` [947] could be calculated incorrectly because the sign of the result was not taken into account. (Bug #31471)
- `SELECT 1 REGEX NULL` caused an assertion failure for debug servers. (Bug #31440)
- A buffer used when setting variables was not dimensioned to accommodate the trailing `'\0'` byte, so a single-byte buffer overrun was possible. (Bug #31588)
- Queries that include a comparison of an `INFORMATION_SCHEMA` table column to `NULL` caused a server crash. (Bug #31633)
- A character set introducer followed by a hexadecimal or bit-value literal did not check its argument and could return an ill-formed result for invalid input. (Bug #30986)
- `CHAR(str USING charset)` [950] did not check its argument and could return an ill-formed result for invalid input. (Bug #30982)
- The result from `CHAR(str USING ucs2` [950]) did not add a leading 0x00 byte for input strings with an odd number of bytes. (Bug #30981)
- For a fatal error during a filesort in `find_all_keys()`, the error was returned without the necessary handler uninitialization, causing an assertion failure. (Bug #31742)
- After changing the SQL mode to a restrictive value that would make already inserted dates in a column be considered invalid, searches returned different results depending on whether the column was indexed. (Bug #28687)
- `SHOW VARIABLES` did not display the `relay_log`, `relay_log_index`, or `relay_log_info_file` system variables. (Bug #28893)
- For `InnoDB` tables with `READ COMMITTED` [1224] isolation level, semi-consistent reads used for `UPDATE` statements skipped rows locked by another transaction, rather than waiting for the locks to be released. Consequently, rows that possibly should have been updated were never examined. (Bug #31310)
- `INFORMATION_SCHEMA.TABLES` was returning incorrect information. (Bug #31381)
- Selecting spatial types in a `UNION` could cause a server crash. (Bug #31155)
- Expressions of the form `WHERE col NOT IN (col, ...)`, where the same column was named both times, could cause a server crash in the optimizer. (Bug #31075)
- `MyISAM` tables could not exceed 4294967295 (2^{32} – 1) rows on Windows. (Bug #30638)
- Some `INFORMATION_SCHEMA` tables are intended for internal use, but could be accessed by using `SHOW` statements. (Bug #30079)
- `INFORMATION_SCHEMA.SCHEMATA` was returning incorrect information. (Bug #30795)
- When a `TIMESTAMP` with a nonzero time part was converted to a `DATE` value, no warning was generated. This caused index lookups to assume that this is a valid conversion and was returning rows that match a comparison between a `TIMESTAMP` value and a `DATE` keypart. Now a warning is generated so that `TIMESTAMP` with a nonzero time part will not match `DATE` values. (Bug #31221)
- An assertion designed to detect a bug in the `ROLLUP` implementation would incorrectly be triggered when used in a subquery context with noncacheable statements. (Bug #31156)
- On Windows, `mysql_upgrade` created temporary files in `C:\` and did not clean them up. (Bug #28774)

- The `MOD()` [975] function and the `%` operator crashed the server for a divisor less than 1 with a very long fractional part. (Bug #31019)
- Using `GROUP BY` on an expression of the form *`timestamp_col`* `DIV` *`number`* caused a server crash due to incorrect calculation of number of decimals. (Bug #30587)
- When invoked with constant arguments, `STR_TO_DATE()` [991] could use a cached value for the format string and return incorrect results. (Bug #30942)
- For a spatial column with a regular (non-`SPATIAL`) index, queries failed if the optimizer tried to use the index. (Bug #30825)
- `INFORMATION_SCHEMA.VIEWS.VIEW_DEFINITION` was incorrect for views that were defined to select from other `INFORMATION_SCHEMA` tables. (Bug #30689)
- If `MAKETIME()` [989] returned `NULL` when used in an `ORDER BY` that was evaluated using `filesort`, a server crash could result. (Bug #31160)
- When expanding a `*` in a `USING` or `NATURAL` join, the check for table access for both tables in the join was done using only the grant information of the first table. (Bug #30468)
- Setting certain values on a table using a spatial index could cause the server to crash. (Bug #30286)
- Index hints specified in view definitions were ignored when using the view to select from the base table. (Bug #28702)
- Views do not have indexes, so index hints do not apply. Use of index hints when selecting from a view is no longer permitted. (Bug #28701)
- `mysqlslap` did not properly handle multiple result sets from stored procedures. (Bug #29985)
- The `mysqlbug` script did not include the correct values of `CFLAGS` and `CXXFLAGS` that were used to configure the distribution. (Bug #31644)
- `configure` did not find `nss` on some Linux platforms. (Bug #29658)
- `GROUP BY NULL WITH ROLLUP` could cause a server crash. (Bug #31095)

  References: See also Bug #32558.
- Automatically allocated memory for string options associated with a plugin was not freed if the plugin did not get installed. (Bug #31382)
- If a user-defined function was used in a `SELECT` statement, and an error occurred during UDF initialization, the error did not terminate execution of the `SELECT`, but rather was converted to a warning. (Bug #32007)
- The `mysql_change_user()` C API function was subject to buffer overflow. (Bug #31669)
- `DROP USER` caused an increase in memory usage. (Bug #31347)
- A server crash could occur if a stored function that contained a `DROP TEMPORARY TABLE` statement was invoked by a `CREATE TEMPORARY TABLE` statement that created a table of the same name. (Bug #30882)
- Under some circumstances, `CREATE TABLE ... SELECT` could crash the server or incorrectly report that the table row size was too large. (Bug #30736)
- The `GeomFromText()` [1061] function could cause a server crash if the first argument was `NULL` or the empty string. (Bug #30955)
- `LAST_INSERT_ID()` [1036] execution could be handled improperly in subqueries. (Bug #31157)

- For `libmysqld` applications, handling of `mysql_change_user()` calls left some pointers improperly updated, leading to server crashes. (Bug #31850)
- Calling `NAME_CONST()` [1042] with nonconstant arguments triggered an assertion failure. Nonconstant arguments are no longer permitted. (Bug #30832)
- A different execution plan was displayed for `EXPLAIN` than would actually have been used for the `SELECT` because the test of sort keys for `ORDER BY` did not consider keys mentioned in `IGNORE KEYS FOR ORDER BY`. (Bug #30665)
- A rule to prefer `filesort` over an indexed `ORDER BY` when accessing all rows of a table was being used even if a `LIMIT` clause was present. (Bug #31094)
- `mysql-test-run.pl` used the `--user` [448] option when starting `mysqld`, which produces warnings if the current user is not `root`. Now `--user` [448] is added only for `root`. (Bug #32078)
- `EXPLAIN EXTENDED` for `SELECT` from `INFORMATION_SCHEMA` tables caused an assertion failure. (Bug #31630)
- `SHOW CREATE TRIGGER` caused a server crash. (Bug #31866)
- Using `ORDER BY` with `ARCHIVE` tables caused a server crash. (Bug #31036)
- `mysqldump` failed to handle databases containing a '`-`' character in the name. (Bug #31113)
- The optimizer could ignore `ORDER BY` in cases when the result set is ordered by `filesort`, resulting in rows being returned in incorrect order. (Bug #30666)
- `GROUP_CONCAT()` [1046] returned `','` rather than an empty string when the argument column contained only empty strings. (Bug #30897)
- Using the `MIN()` [1047] or `MAX()` [1046] function to select one part of a multi-part key could cause a crash when the function result was `NULL`. (Bug #30715)
- The server crashed on optimizations involving a join of `INT` and `MEDIUMINT` columns and a system variable in the `WHERE` clause. (Bug #32103)
- Under certain conditions, the presence of a `GROUP BY` clause could cause an `ORDER BY` clause to be ignored. (Bug #32202)
- For an almost-full `MyISAM` table, an insert that failed could leave the table in a corrupt state. (Bug #31305)
- On 64-bit platforms, assignments of values to enumeration-valued storage engine-specific system variables were not validated and could result in unexpected values. (Bug #32034)
- The examined-rows count was not incremented for `const` [696] queries. (Bug #31700)
- The `log` and `log_slow_queries` [490] system variables were displayed by `SHOW VARIABLES` but could not be accessed in expressions as `@@log` and `@@log_slow_queries`. Also, attempting to set them with `SET` produced an incorrect `Unknown system variable` message. Now these variables are treated as synonyms for `general_log` [477] and `slow_query_log` [522], which means that they can be accessed in expressions and their values can be changed with `SET`. (Bug #29131)
- `HAVING` could treat lettercase of table aliases incorrectly if `lower_case_table_names` [492] was enabled. (Bug #31562)
- The server could crash during `filesort` for `ORDER BY` based on expressions with `INET_NTOA()` [1041] or `OCT()` [955] if those functions returned `NULL`. (Bug #31758)
- Comparison results for `BETWEEN` [941] were different from those for operators like `<` [940] and `>` [940] for `DATETIME`-like values with trailing extra characters such as `'2007-10-01 00:00:00 GMT-6'`. `BETWEEN` [941] treated the values as `DATETIME`, whereas the other operators performed

a binary-string comparison. Now they all uniformly use a `DATETIME` comparison, but generate warnings for values with trailing garbage. (Bug #31800)

- In debug builds, testing the result of an `IN` subquery against `NULL` caused an assertion failure. (Bug #31884)
- User-defined functions are not loaded if the server is started with the `--skip-grant-tables` [443] option, but the server did not properly handle this case and issued an `Out of memory` error message instead. (Bug #32020)
- Some uses of user variables in a query could result in a server crash. (Bug #32260)
- `myisamchk --unpack` could corrupt a table that when unpacked has static (fixed-length) row format. (Bug #31277)
- It was not possible for client applications to distinguish between auto-set and auto-updated `TIMESTAMP` column values.

  To rectify this problem, a new `ON_UPDATE_NOW_FLAG` flag is set by Field_timestamp constructors whenever a column should be set to `NOW` on `UPDATE`, and the `get_schema_column_record()` function now reports whether a timestamp column is set to `NOW` on `UPDATE`. In addition, such columns now display `on update CURRENT_TIMESTAMP` in the `Extra` column in the output from `SHOW COLUMNS`. (Bug #30081)
- When doing a `DELETE` on a table that involved a `JOIN` with `MyISAM` or `MERGE` tables and the `JOIN` referred to the same table, the operation could fail reporting `ERROR 1030 (HY000): Got error 134 from storage engine`. This was because scans on the table contents would change because of rows that had already been deleted. (Bug #28837)
- Data in `BLOB` or `GEOMETRY` columns could be cropped when performing a `UNION` query. (Bug #31158)
- Tables with a `GEOMETRY` column could be marked as corrupt if you added a non-`SPATIAL` index on a `GEOMETRY` column. (Bug #30284)
- Many nested subqueries in a single query could led to excessive memory consumption and possibly a crash of the server. (Bug #31048)
- Server variables could not be set to their current values on Linux platforms. (Bug #31177)

  References: See also Bug #6958.
- Repeated execution of a query containing a `CASE` expression and numerous `AND` and `OR` relations could crash the server. The root cause of the issue was determined to be that the internal `SEL_ARG` structure was not properly initialized when created. (Bug #32403)
- Memory corruption could occur due to large index map in `Range checked for each record` status reported by `EXPLAIN SELECT`. The problem was based in an incorrectly calculated length of the buffer used to store a hexadecimal representation of an index map, which could result in buffer overrun and stack corruption under some circumstances. (Bug #32241)
- Comparison of a `BIGINT NOT NULL` column with a constant arithmetic expression that evaluated to NULL mistakenly caused the error `Column '...' cannot be null` (error 1048). (Bug #32335)
- An `ORDER BY` query on a view created using a `FEDERATED` table as a base table caused the server to crash. (Bug #32374)
- Referencing within a subquery an alias used in the `SELECT` list of the outer query was incorrectly permitted. (Bug #32400)
- A query of the form `SELECT @user_variable := constant AS alias FROM table GROUP BY alias WITH ROLLUP` crashed the server. (Bug #32482)

- Using `SELECT INTO OUTFILE` with 8-bit `ENCLOSED BY` characters led to corrupted data when the data was reloaded using LOAD DATA INFILE. This was because `SELECT INTO OUTFILE` failed to escape the 8-bit characters. (Bug #32533)
- A `SELECT ... GROUP BY bit_column` query failed with an assertion if the length of the `BIT` column used for the `GROUP BY` was not an integer multiple of 8. (Bug #32556)
- A subquery using an `IS NULL` check of a column defined as `NOT NULL` in a table used in the `FROM` clause of the outer query produced an invalid result. (Bug #32694)
- Flushing a merge table between the time it was opened and its child table were actually attached caused the server to crash. (Bug #30273)

  References: This bug was introduced by Bug #26379.
- Using `ORDER BY` led to the wrong result when using the `ARCHIVE` on a table with a `BLOB` when the table cache was full. The table could also be reported as crashed after the query had completed, even though the table data was intact. (Bug #31833)
- When casting a string value to an integer, cases where the input string contained a decimal point and was long enough to overrun the `unsigned long long` type were not handled correctly. The position of the decimal point was not taken into account which resulted in miscalculated numbers and incorrect truncation to appropriate SQL data type limits. (Bug #30453)
- The options available to the `CHECK TABLE` statement were also permitted in `OPTIMIZE TABLE` and `ANALYZE TABLE` statements, but caused corruption during their execution. These options were never supported for these statements, and an error is now raised if you try to apply these options to these statements. (Bug #30495)
- `REGEXP` [963] operations could cause a server crash for character sets such as `ucs2`. Now the arguments are converted to `utf8` if possible, to permit correct results to be produced if the resulting strings contain only 8-bit characters. (Bug #31081)
- For `SELECT ... INTO OUTFILE`, if the `ENCLOSED BY` string is empty and the `FIELDS TERMINATED BY` string started with a special character (one of `n`, `t`, `r`, `b`, `0`, `Z`, or `N`), every occurrence of the character within field values would be duplicated. (Bug #31663)
- `SHOW COLUMNS` and `DESCRIBE` displayed `null` as the column type for a view with no valid definer. This caused `mysqldump` to produce a nonreloadable dump file for the view. (Bug #31662)
- Queries that used the `ref` [697] access method or index-based subquery execution over indexes that have `DECIMAL` columns could fail with an error `Column col_name cannot be null`. (Bug #31450)
- On some 64-bit systems, inserting the largest negative value into a `BIGINT` column resulted in incorrect data. (Bug #30069)
- The server crashed after insertion of a negative value into an `AUTO_INCREMENT` column of an `InnoDB` table. (Bug #31860)
- Some valid `euc-kr` characters having the second byte in the ranges `[0x41..0x5A]` and `[0x61..0x7A]` were rejected. (Bug #30315)
- `InnoDB` does not support `SPATIAL` indexes, but could crash when asked to handle one. Now an error is returned. (Bug #32125)
- `ssl-cipher` values in option files were not being read by `libmysqlclient`. (Bug #32429)
- `SHOW VARIABLES` did not correctly display the value of the `thread_handling` [532] system variable. (Bug #28785)
- Using `ALTER EVENT` to rename a disabled event caused it to become enabled. (Bug #31539)
- `mysql-test-run.pl` could not run `mysqld` with `root` privileges. (Bug #30630)

- Sending several `KILL QUERY` statements to target a connection running `SELECT SLEEP()` could freeze the server. (Bug #32436)
- For `FLUSH TABLES WITH READ LOCK`, the server failed to properly detect write-locked tables when running with low-priority updates, resulting in a crash or deadlock. (Bug #32528)
- Use of a `NULL`-returning `GROUP BY` expression in conjunction with `WITH ROLLUP` could cause a server crash. (Bug #32558)

  References: See also Bug #31095.
- For transactional tables, an error during a multiple-table `DELETE` statement did not roll back the statement. (Bug #29136)
- A `DELETE` statement with a subquery in the `WHERE` clause would sometimes ignore an error during subquery evaluation and proceed with the delete operation. (Bug #32030)
- The server used unnecessarily large amounts of memory when user variables were used as an argument to `CONCAT()` [951] or `CONCAT_WS()` [951]. (Bug #31898)
- Using dates in the range `'0000-00-01'` to `'0000-00-99'` range in the `WHERE` clause could result in an incorrect result set. (These dates are not in the supported range for `DATE`, but different results for a given query could occur depending on position of records containing the dates within a table.) (Bug #32021)
- The `INTERVAL()` [943] function incorrectly handled `NULL` values in the value list. (Bug #32560)
- With `lower_case_table_names` [492] set, `CREATE TABLE LIKE` was treated differently by `libmysqld` than by the nonembedded server. (Bug #32063)
- Assigning a 65,536-byte string to a `TEXT` column (which can hold a maximum of 65,535 bytes) resulted in truncation without a warning. Now a truncation warning is generated. (Bug #32282)
- Changing the SQL mode to cause dates with “zero” parts to be considered invalid (such as `'1000-00-00'`) could result in indexed and nonindexed searches returning different results for a column that contained such dates. (Bug #31928)
- Killing a statement could lead to a race condition in the server. (Bug #32148)
- `ucs2` does not work as a client character set, but attempts to use it as such were not rejected. Now `character_set_client` [464] cannot be set to `ucs2`. This also affects statements such as `SET NAMES` and `SET CHARACTER SET`. (Bug #31615)
- If a global read lock acquired with `FLUSH TABLES WITH READ LOCK` was in effect, executing `ALTER TABLE` could cause a server crash. (Bug #32395)
- For a table that had been opened with `HANDLER` and marked for reopening after being closed with `FLUSH TABLES`, `DROP TABLE` did not properly discard the handler. (Bug #31397)
- The `mysql` client program now ignores Unicode byte order mark (BOM) characters at the beginning of input files. Previously, it read them and sent them to the server, resulting in a syntax error.

  Presence of a BOM does not cause `mysql` to change its default character set. To do that, invoke `mysql` with an option such as `--default-character-set=utf8` [261]. (Bug #29323)
- For comparisons of the form *`date_col OP datetime_const`* (where *`OP`* is = [939], < [940], > [940], <= [940], or >= [940]), the comparison is done using `DATETIME` values, per the fix for Bug #27590. However that fix caused any index on *`date_col`* not to be used and compromised performance. Now the index is used again. (Bug #32198)
- The server crashed in the parser when running out of memory. Memory handling in the parser has been improved to gracefully return an error when out-of-memory conditions occur in the parser. (Bug #31153)

- The default grant tables on Windows contained information for host `production.mysql.com`, which should not be there. (Bug #32219)
- `mysqlslap` was missing from the MySQL 5.1.22 Linux RPM packages. (Bug #32077)
- `SHOW EVENTS` and selecting from the `INFORMATION_SCHEMA.EVENTS` table failed if the current database was `INFORMATION_SCHEMA`. (Bug #32775)
- `InnoDB` now tracks locking and use of tables by MySQL only after a table has been successfully locked on behalf of a transaction. Previously, the locked flag was set and the table in-use counter was updated before checking whether the lock on the table succeeded. A subsequent failure in obtaining a lock on the table led to an inconsistent state as the table was neither locked nor in use. (Bug #31444)
- The fix for Bug #11230 and Bug #26215 introduced a significant input-parsing slowdown for the `mysql` client. This has been corrected. (Bug #33057)
- Spurious duplicate-key errors could occur for multiple-row inserts into an `InnoDB` table that activate a trigger. (Bug #31540)
- Within a subquery, `UNION` was handled differently than at the top level, which could result in incorrect results or a server crash. (Bug #32036, Bug #32051)
- Improper calculation of `CASE` [946] expression results could lead to value truncation. (Bug #30782)
- Use of the `cp932` character set with `CAST()` [1012] in an `ORDER BY` clause could cause a server crash. (Bug #32726)
- The rules for valid column names were being applied differently for base tables and views. (Bug #32496)
- `DATETIME` arguments specified in numeric form were treated by `DATE_ADD()` [983] as `DATE` values. (Bug #32180)
- Various test program cleanups were made: 1) `mytest` and `libmysqltest` were removed. 2) `bug25714` displays an error message when invoked with incorrect arguments or the `--help` option. 3) `mysql_client_test` exits cleanly with a proper error status. (Bug #32221)
- `HOUR()` [988], `MINUTE()` [989], and `SECOND()` [991] could return nonzero values for `DATE` arguments. (Bug #31990)
- Specifying a nonexistent column for an `INSERT DELAYED` statement caused a server crash rather than producing an error. (Bug #32676)
- Use of `CLIENT_MULTI_QUERIES` caused `libmysqld` to crash. (Bug #32624)
- `mysqlslap` failed to commit after the final record load. (Bug #31704)
- MySQL declares a `UNIQUE` key as a `PRIMARY` key if it doesn't have `NULL` columns and is not a partial key, and the `PRIMARY` key must alway be the first key. However, in some cases, a nonfirst key could be reported as `PRIMARY`, leading to an assert failure by `InnoDB`. This is fixed by correcting the key sort order. (Bug #31137)
- `MIN()` [1047] and `MAX()` [1046] could return incorrect results when an index was present if a loose index scan was used. (Bug #32268)
- With `libmysqld`, use of prepared statements and the query cache at the same time caused problems. (Bug #30430)
- The optimizer incorrectly optimized conditions out of the `WHERE` clause in some queries involving subqueries and indexed columns. (Bug #30788)
- For `CREATE ... SELECT ... FROM`, where the resulting table contained indexes, adding `SQL_BUFFER_RESULT` to the `SELECT` part caused index corruption in the table. (Bug #30384)

- Denormalized double-precision numbers cannot be handled properly by old MIPS processors. For IRIX, this is now handled by enabling a mode to use a software workaround. (Bug #29085)
- The optimizer made incorrect assumptions about the value of the `is_member` value for user-defined functions, sometimes resulting in incorrect ordering of UDF results. (Bug #30355)
- Simultaneous `ALTER TABLE` statements for `BLACKHOLE` tables caused 100% CPU use due to locking problems. (Bug #30294)
- If the server crashed during an `ALTER TABLE` statement, leaving a temporary file in the database directory, a subsequent `DROP DATABASE` statement failed due to the presence of the temporary file. (Bug #30152)
- `CREATE TABLE ... SELECT` created tables that for date columns used the obsolete `Field_date` type instead of `Field_newdate`. (Bug #33256)
- Use of uninitialized memory for `filesort` in a subquery caused a server crash. (Bug #33675)
- Name resolution for correlated subqueries and `HAVING` clauses failed to distinguish which of two was being performed when there was a reference to an outer aliased field. This could result in error messages about a `HAVING` clause for queries that had no such clause. (Bug #31797)
- The correct data type for a `NULL` column resulting from a `UNION` could be determined incorrectly in some cases: 1) Not correctly inferred as `NULL` depending on the number of selects; 2) Not inferred correctly as `NULL` if one select used a subquery. (Bug #32848)
- For queries containing `GROUP_CONCAT(DISTINCT col_list ORDER BY col_list)`, there was a limitation that the `DISTINCT` columns had to be the same as `ORDER BY` columns. Incorrect results could be returned if this was not true. (Bug #32798)
- The `LAST_DAY()` [988] function returns a `DATE` value, but internally the value did not have the time fields zeroed and calculations involving the value could return incorrect results. (Bug #32770)
- The `thread_handling` [532] system variable was treated as having a `SESSION` value and as being settable at runtime. Now it has only a `GLOBAL` read-only value. (Bug #30651)
- An issue with the `NO_ENGINE_SUBSTITUTION` [574] `sql_mode` [526] database can cause the creation of stored routines to fail. If you are having problems with creating stored routines while using this `sql_mode` [526] value, remove this value from your `sql_mode` [526] setting. (Bug #32633)
- A multiple-table `UPDATE` involving transactional and nontransactional tables caused an assertion failure. (Bug #30763)
- Some valid `SELECT` statements could not be used as views due to incorrect column reference resolution. (Bug #33133)
- `mysqld_safe` looked for error messages in the wrong location. (Bug #32679)
- For tables with certain definitions, `UPDATE` statements could fail to find the correct record to update and report an error when the record did in fact exist. (Bug #31747)
- `mysql-test-run.pl` sometimes set up test scenarios in which the same port number was passed to multiple servers, causing one of them to be unable to start. (Bug #31880)
- The `ExtractValue()` [1016] and `UpdateXML()` [1018] functions performed extremely slowly for large amounts of XML data (greater than 64 KB). These functions now execute approximately 2000 times faster than previously. (Bug #27287)
- `LOAD DATA INFILE` ran very slowly when reading large files into partitioned tables. (Bug #26527)
- Fast-mutex locking was not thread-safe and optimization-safe on some platforms, which could cause program failures such as out-of-memory errors. (Bug #28284)

- `mysql_upgrade` could run binaries dynamically linked against incorrect versions of shared libraries. (Bug #28560)
- For `InnoDB` tables, `CREATE TABLE a AS SELECT * FROM A` would fail. (Bug #25164)
- MySQL failed to generate or retrieve an `AUTO_INCREMENT` primary key for `InnoDB` tables with user-defined partitioning. (Bug #27405)
- A `SELECT` with more than 31 nested dependent subqueries returned an incorrect result. (Bug #27352)
- Some character mappings in the `ascii.xml` file were incorrect.

  As a result of this bug fix, indexes must be rebuilt for columns that use the `ascii_general_ci` collation for columns that contain any of these characters: `'`'`, `'['`, `'\'`, `']'`, `'~'`. See Checking Whether Tables or Indexes Must Be Rebuilt. (Bug #27562)
- For a prepared statement *`stmt`*, changing the default database following `PREPARE` *`stmt`* but before `EXECUTE` *`stmt`* caused *`stmt`* to be recorded incorrectly in the binary log. (Bug #25843)
- Some `SHOW` statements and `INFORMATION_SCHEMA` queries could expose information not permitted by the user's access privileges. An implication of this change is that `SHOW TRIGGERS` and the `INFORMATION_SCHEMA.TRIGGERS` table require the `TRIGGER` [628] privilege, not `SUPER` [628]. (Bug #27629)
- `mysqlbinlog` produced incorrectly formatted `DATETIME` and `TIMESTAMP` values. (Bug #27894)
- Using `HANDLER` to open a table having a storage engine not supported by `HANDLER` properly returned an error, but also improperly prevented the table from being dropped by other connections. (Bug #25856)
- With recent versions of DBD::mysql, `mysqlhotcopy` generated table names that were doubly qualified with the database name. (Bug #27694)
- Partition pruning was not used for queries having `<=` or `>=` conditions in the `WHERE` clause on a table using `TO_DAYS()` [994] in the partitioning expression. (Bug #27927)
- `STR_TO_DATE()` [991] displayed an error message that referred to `STR_TO_TIME()`. (Bug #27014)
- Entries in the general query log were truncated at 1000 characters. (Bug #21557)
- A `SELECT` in one connection could be blocked by `INSERT ... ON DUPLICATE KEY UPDATE` in another connection even when `low_priority_updates` [491] is set. (Bug #28587)
- Failure to log to the `general_log` [477] or `slow_log` log tables were not logged to the error log at all or were logged incorrectly. (Bug #27858)
- Changes to the `sql_mode` [526] system variable were not tracked by `INSERT DELAYED`. (Bug #27358)
- The `returns` column of the `mysql.proc` table was `CHAR(64)`, which is not long enough to store long data types such as `ENUM` types. The column has been changed to `LONGBLOB` and a warning is generated if truncation occurs when storing a row into the `proc` table. (Bug #24923)
- A memory leak occurred when `CREATE TEMPORARY TABLE .. SELECT` was invoked from a stored function that in turn was called from `CREATE TABLE ... SELECT`. (Bug #21136)
- The parser confused user-defined function (UDF) and stored function creation for `CREATE FUNCTION` and required that there be a default database when creating UDFs, although there is no such requirement. (Bug #28318, Bug #29816)
- If a column selected by a view referred to a stored function, the data type reported for the column in `INFORMATION_SCHEMA.COLUMNS` could be incorrect. (Bug #20550)

- For a table that used different full-text parsers for different `FULLTEXT` indexes, `SHOW CREATE TABLE` displayed the first parser name for all of them. (Bug #27040)
- `mysqldump` reversed the event name and program name in one of its error messages. (Bug #28535)
- `comp_err` created files with permissions such that they might be inaccessible during `make install` operations. (Bug #27789)
- Worked around an `icc` problem with an incorrect machine instruction being generated in the context of software pre-fetching after a subroutine got in-lined. (Upgrading to `icc` 10.0.026 makes the workaround unnecessary.) (Bug #20803)
- On Windows, writes to the debug log were using `freopen()` instead of `fflush()`, resulting in slower performance. (Bug #27099)
- The result from `CHAR()` [950] was incorrectly assumed in some contexts to return a single-byte result. (Bug #28550)
- The metadata in some `MYSQL_FIELD` members could be incorrect when a temporary table was used to evaluate a query. (Bug #27990)
- The anonymous accounts were not being created during MySQL installation. (Bug #27692)
- `ALTER TABLE tbl_name ROW_FORMAT=format_type` did not cause the table to be rebuilt. (Bug #27610)
- For storage engines that do not redefine `handler::index_next_same()` and are capable of indexes, statements that include a `WHERE` clause might select incorrect data. (Bug #22351)
- The result of a comparison between `VARBINARY` and `BINARY` columns differed depending on whether the `VARBINARY` column was indexed. (Bug #28076)
- Threads that were calculating the estimated number of records for a range scan did not respond to the `KILL` statement. That is, if a `range` [698] join type is possible (even if not selected by the optimizer as a join type of choice and thus not shown by `EXPLAIN`), the query in the `statistics` state (shown by the `SHOW PROCESSLIST`) did not respond to the `KILL` statement. (Bug #25421)
- When running the MySQL Instance Configuration Wizard, a race condition could exist that would fail to connect to a newly configured instance. This was because `mysqld` had not completed the startup process before the next stage of the installation process. (Bug #28628)
- Some queries using the `NAME_CONST()` [1042] function failed to return either a result or an error to the client, causing it to hang. This was due to the fact that there was no check to insure that both arguments to this function were constant expressions. (Bug #27545, Bug #32559)
- `mysqld` sometimes miscalculated the number of digits required when storing a floating-point number in a `CHAR` column. This caused the value to be truncated, or (when using a debug build) caused the server to crash. (Bug #26788)

  References: See also Bug #12860.
- If the expected precision of an arithmetic expression exceeded the maximum precision supported by MySQL, the precision of the result was reduced by an unpredictable or arbitrary amount, rather than to the maximum precision. In some cases, exceeding the maximum supported precision could also lead to a crash of the server. (Bug #24907)
- For `mysql --show-warnings`, warnings were in some cases not displayed. (Bug #25146)
- For an event with an `ON COMPLETION` value of `PRESERVE`, an `ALTER EVENT` statement that specified no `ON COMPLETION` option caused the value to become `NOT PRESERVE`. (Bug #27407)
- With the `read_only` [517] system variable enabled, `CREATE DATABASE` and `DROP DATABASE` were permitted to users who did not have the `SUPER` [628] privilege. (Bug #27440)

- `CREATE TABLE LIKE` did not work when the source table was an `INFORMATION_SCHEMA` table. (Bug #25629)
- The parser treated the `INTERVAL()` [943] function incorrectly, leading to situations where syntax errors could result depending on which side of an arithmetic operator the function appeared. (Bug #22312)
- A `CREATE TRIGGER` statement could cause a deadlock or server crash if it referred to a table for which a table lock had been acquired with `LOCK TABLES`. (Bug #23713)
- It was possible to execute `CREATE TABLE t1 ... SELECT ... FROM t2` with the `CREATE` [626] privilege for `t1` and `SELECT` [627] privilege for `t2`, even in the absence of the `INSERT` [627] privilege for `t1`. (Bug #20901)
- Symbolic links on Windows could fail to work. (Bug #26811)
- A race condition between killing a statement and the thread executing the statement could lead to a situation such that the binary log contained an event indicating that the statement was killed, whereas the statement actually executed to completion. (Bug #27571)
- The `mysql_insert_id()` C API function sometimes returned different results for `libmysqld` and `libmysqlclient`. (Bug #26921)
- It makes no sense to attempt to use `ALTER TABLE ... ORDER BY` to order an `InnoDB` table if there is a user-defined clustered index, because rows are always ordered by the clustered index. Such attempts now are ignored and produce a warning.

  Also, in some cases, `InnoDB` incorrectly used a secondary index when the clustered index would produce a faster scan. `EXPLAIN` output now indicates use of the clustered index (for tables that have one) as lines with a `type` value of `index` [698], a `key` value of `PRIMARY`, and without `Using index` in the `Extra` value. (Bug #26447)

  References: See also Bug #35850.
- For Vista installs, `MySQLInstanceConfig.exe` did not add the default MySQL port to the firewall exceptions. It now provides a check box that enables the user a choice of whether to do this. (Bug #24853)
- An `ORDER BY` at the end of a `UNION` affected individual `SELECT` statements rather than the overall query result. (Bug #27848)
- The `-lmtmalloc` library was removed from the output of `mysql_config` on Solaris, as it caused problems when building `DBD::mysql` (and possibly other applications) on that platform that tried to use `dlopen()` to access the client library. (Bug #18322)
- Parameters of type `DATETIME` or `DATE` in stored procedures were silently converted to `VARBINARY`. (Bug #13675)
- The `Aborted_clients` [559] status variable was incremented twice if a client exited without calling `mysql_close()`. (Bug #16918)
- Clients were ignoring the TCP/IP port number specified as the default port using the `--with-tcp-port` [134] configuration option. (Bug #15327)
- The `mysql_change_user()` C API function changed the value of the `sql_big_selects` [524] session variable. (Bug #20023)

  References: See also Bug #40363.
- Host names sometimes were treated as case sensitive in account-management statements (`CREATE USER`, `GRANT`, `REVOKE`, and so forth). (Bug #19828)
- Issuing an SQL `KILL` of the active connection caused an error on Mac OS X. (Bug #19723)

- The `readline` library has been updated to version 5.2. This addresses issues in the `mysql` client where history and editing within the client would fail to work as expected. (Bug #18431)
- Zero-padding of exponent values was not the same across platforms. (Bug #12860)
- `MySQLInstanceConfig.exe` failed to grant certain privileges to the `'root'@'%'` account. (Bug #17303)
- Use of `GRANT` statements with grant tables from an old version of MySQL could cause a server crash. (Bug #16470)
- Executing `DISABLE KEYS` and `ENABLE KEYS` on a nonempty table would cause the size of the index file for the table to grow considerable. This was because the `DISABLE KEYS` operation would only mark the existing index, without deleting the index blocks. The `ENABLE KEYS` operation would re-create the index, adding new blocks, while the previous index blocks would remain. Existing indexes are now dropped and recreated when the `ENABLE KEYS` statement is executed. (Bug #4692)
- Values of types `REAL ZEROFILL`, `DOUBLE ZEROFILL`, `FLOAT ZEROFILL`, were not zero-filled when converted to a character representation in the C prepared statement API. (Bug #11589)
- Several buffer-size system variables were either being handled incorrectly for large values (for settings larger than 4GB, they were truncated to values less than 4GB without a warning), or were limited unnecessarily to 4GB even on 64-bit systems. The following changes were made:
  - For `key_buffer_size` [483], values larger than 4GB are permitted on 64-bit platforms.
  - For `join_buffer_size` [482], `sort_buffer_size` [523], and `myisam_sort_buffer_size` [503], values larger than 4GB are permitted on 64-bit platforms (except Windows, for which large values are truncated to 4GB with a warning).

  In addition, settings for `read_buffer_size` [516] and `read_rnd_buffer_size` [518] are limited to 2GB on all platforms. Larger values are truncated to 2GB with a warning. (Bug #5731, Bug #29419, Bug #29446)
- `mysql` stripped comments from statements sent to the server. Now the `--comments` [294] or `--skip-comments` [301] option can be used to control whether to retain or strip comments. The default is `--skip-comments` [301]. (Bug #11230, Bug #26215)
- Grant table checks failed in `libmysqld`.

Changes in MySQL 5.1.22 (2007-09-24, Release Candidate)

Functionality Added or Changed

- There is a new `innodb_autoinc_lock_mode` [1362] system variable to configure the locking behavior that `InnoDB` uses for generating auto-increment values. The default behavior now is slightly different from before, which involves a minor incompatibility for multiple-row inserts that specify an explicit value for the auto-increment column in some but not all rows. See `AUTO_INCREMENT` Handling in `InnoDB`.

Bugs Fixed

- **MySQL Cluster**: **Replication**: (Replication): Multi-master replication setups did not handle `--log-slave-updates` [1628] correctly. (Bug #30017)
- **MySQL Cluster**: Backups of `TIMESTAMP` columns made with `ndb_restore` on a MySQL Cluster using data nodes hosts of one endian could not be used to restore the cluster's data to data node hosts of the other endian. (Bug #30134)
- **Replication**: Operations that used the time zone replicated the time zone only for successful operations, but did not replicate the time zone for errors that need to know it. (Bug #29536)

- **Replication**: Row-based replication from a pre-5.1.22 MySQL Server to a MySQL 5.1.22 was unstable due to an uninitialized variable. (Bug #31076)
- For an `InnoDB` table if a `SELECT` was ordered by the primary key and also had a `WHERE field = value` clause on a different field that was indexed, a `DESC` order instruction would be ignored. (Bug #31001)
- Tables using the `InnoDB` storage engine incremented `AUTO_INCREMENT` values incorrectly with `ON DUPLICATE KEY UPDATE`. (Bug #28781)
- When using a combination of `HANDLER... READ` and `DELETE` on a table, MySQL continued to open new copies of the table every time, leading to an exhaustion of file descriptors. (Bug #29474)

  References: This bug was introduced by Bug #21587.
- Using `KILL QUERY` or `KILL CONNECTION` to kill a `SELECT` statement caused a server crash if the query cache was enabled. (Bug #30201)
- `mysql_install_db` could fail to find its message file. (Bug #30678)
- The `mysql_list_fields()` C API function incorrectly set `MYSQL_FIELD::decimals` for some view columns. (Bug #29306)
- Under some circumstances, a UDF initialization function could be passed incorrect argument lengths. (Bug #29804)
- `mysqldump` from the MySQL 5.1.21 distribution could not be used to create a dump from a MySQL 5.1.20 or older server. (Bug #30123)
- The server created temporary tables for filesort operations in the working directory, not in the directory specified by the `tmpdir` [534] system variable. (Bug #30287)
- `CONNECTION_ID()` [1033] always returned 0 for the embedded server (`libmysqld`). (Bug #30389)
- Memory corruption occurred for some queries with a top-level `OR` operation in the `WHERE` condition if they contained equality predicates and other sargable predicates in disjunctive parts of the condition. (Bug #30396)
- Nonrange queries of the form `SELECT ... FROM ... WHERE keypart1=constant, ..., keypartN=constant ORDER BY ... FOR UPDATE` sometimes were unnecessarily blocked waiting for a lock if another transaction was using `SELECT ... FOR UPDATE` on the same table. (Bug #28570)
- Read lock requests that were blocked by a pending write lock request were not permitted to proceed if the statement requesting the write lock was killed. (Bug #21281)
- On Windows, symbols for yaSSL and taocrypt were missing from `mysqlclient.lib`, resulting in unresolved symbol errors for clients linked against that library. (Bug #27861)

Changes in MySQL 5.1.21 (2007-08-16)

This is a new Beta development release, fixing recently discovered bugs.

Note

This Beta release, as any other pre-production release, should not be installed on *production* level systems or systems with critical data. It is good practice to back up your data before installing any new version of software. Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at http://bugs.mysql.com/ for more details about the individual bugs fixed in this version.

Note

Subsequent to release, it was discovered that on some platforms, `mysql_install_db` could fail to find its message file, resulting in error messages of the following form:

```
shell> mysql_install_db
Installing MySQL system tables...
070830  9:33:24 [ERROR] Can't find messagefile 'path/share/english/errmsg.sys'
070830  9:33:24 [ERROR] Aborting
```

To deal with this problem, specify a `--language` [429] option to specify the proper path name to the language file directory. For example:

```
shell> mysql_install_db --language=/path/to/share/english/
```

This problem is corrected in MySQL 5.1.22.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details, please see http://www.mysql.com/products/enterprise.

Functionality Added or Changed

- **Incompatible Change**: In MySQL 5.1.6, when log tables were implemented, the default log destination for the general query and slow query log was `TABLE`. This default has been changed to `FILE`, which is compatible with MySQL 5.0, but incompatible with earlier releases of MySQL 5.1 from 5.1.6 to 5.1.20. If you are upgrading from MySQL 5.0 to 5.1.21 or higher, no logging option changes should be necessary. However, if you are upgrading from 5.1.6 through 5.1.20 to 5.1.21 or higher and were using `TABLE` logging, use the `--log-output=TABLE` [431] option explicitly to preserve your server's table-logging behavior.

  A further fix for this issue was made in MySQL 5.1.23. (Bug #29993)

- **Incompatible Change**: On Windows only, the `mysqld-nt` has been removed from this release and all future releases. The `mysqld` server now includes named-pipe support as standard, and you do not have to use the `mysqld-nt` version to enable named-pipe support.

- **Incompatible Change**: The `innodb_log_arch_dir` [1375] system variable (which has been deprecated since MySQL 5.0.24) has been removed and should no longer be used.

- **Important Change**: The default `mysqld_safe` logging behavior now is `--skip-syslog` [242] rather than `--syslog` [242], which is compatible with the default behavior of writing an error log file for releases prior to 5.1.20.

- **Replication**: The SQL thread on a slave now is always permitted to enter `InnoDB` even if this would exceed the limit imposed by the `innodb_thread_concurrency` [1383] system variable. In cases of high load on the slave server (when `innodb_thread_concurrency` [1383] is reached), this change helps the slave stay more up to date with the master; in the previous behavior, the SQL thread was competing for resources with all client threads active on the slave server. (Bug #25078)

- **Replication**: Replication between master and slaves now supports different column numbers within a table on both master and slave. The rules for replication where the table definitions are different has also changed. This supercedes the functionality for replication from the master table to a slave table with more columns that was added in MySQL 5.1.12. For more information, see Replication with Differing Table Definitions on Master and Slave.

- Previously, prepared statements processed using `PREPARE` and `EXECUTE` were not subject to caching in the query cache if they contained any `?` parameter markers. This limitation has been lifted. (Bug #29318)

- Transaction support in the `FEDERATED` storage engine has been disabled due to issues with multiple active transactions and sessions on the same `FEDERATED` table. (Bug #29875)

- The `--syslog` [242] option that was introduced in 5.1.20 for `mysqld_safe` (to send error output to `syslog`) did not work correctly: Error output was buffered and not logged immediately. This has been corrected. In addition, some feature changes were made:

  -

    Important

    The default `mysqld_safe` logging behavior now is `--skip-syslog` [242] rather than `--syslog` [242], which is compatible with the default behavior of writing an error log file for releases prior to 5.1.20.

  - A new option, `--syslog-tag=`*`tag`* [242], modifies the default tags written by `mysqld_safe` and `mysqld` to syslog to be `mysqld_safe-`*`tag`* and `mysqld-`*`tag`* rather than the default tags of `mysqld_safe` and `mysqld`.

  (Bug #29992)

- Several programs now accept `--debug-check` and `--debug-info` options: `mysql`, `mysqladmin`, `mysqlbinlog`, `mysqlcheck`, `mysqldump`, `mysqlimport`, `mysqlshow`, `mysqlslap`, `mysqltest`, `mysql_upgrade`. (Note: `mysql`, `mysqladmin`, `mysqlcheck`, `mysqldump`, `mysqlimport`, `mysqlshow`, and `mysqltest` already accepted `--debug-info`.) `--debug-check` prints debugging information at program exit. `--debug-info` is similar but also prints memory and CPU usage statistics. This patch also corrects a problem for `mysql` that `--debug-info` did not display statistics at exit time. (Bug #30127)

- It is now possible to set `long_query_time` [491] in microseconds or to 0. Setting this value to 0 causes all queries to be recorded in the slow query log.

  Currently, fractional values can be used only when logging to files. We plan to provide this functionality for logging to tables when time-related data types are enhanced to support microsecond resolution. (Bug #25412)

- Log table locking was redesigned, eliminating several lock-related problems:

  - Truncating `mysql.slow_log` in a stored procedure after use of a cursor caused the thread to lock.

  - Flushing a log table resulted in unnecessary warnings.

  - The server would hang when performing concurrent `ALTER TABLE` or `TRUNCATE TABLE` statements against the log tables.

  - Changing the value of the `general_log` [477] system variable while a global read lock was in place resulted in deadlock.

  The changes provide better-defined interface characteristics. See Selecting General Query and Slow Query Log Output Destinations. (Bug #17876, Bug #23044, Bug #25422, Bug #29129)

- `INFORMATION_SCHEMA` implementation changes were made that optimize certain types of queries for `INFORMATION_SCHEMA` tables so that they execute more quickly. `INFORMATION_SCHEMA` Optimization, provides guidelines on how to take advantage of these optimizations by writing queries that minimize the need for the server to access the file system to obtain the information contained in `INFORMATION_SCHEMA` tables. By writing queries that enable the server to avoid directory scans or opening table files, you will obtain better performance. (Bug #19588)

- Two options relating to slow query logging have been added for `mysqld`. `--log-slow-slave-statements` causes slow statements executed by a replication slave to be written to the slow query log; `min_examined_row_limit` [500] can be used to cause queries which examine fewer than the stated number of rows not to be logged.

- A new option, `--syslog-tag=tag` [242], modifies the default tags written by `mysqld_safe` and `mysqld` to syslog to be `mysqld_safe-tag` and `mysqld-tag` rather than the default tags of `mysqld_safe` and `mysqld`.

- Added the `--commit` [317], `--detach` [318], `--post-system` [319], and `--pre-system` [319] options for `mysqlslap`.

Bugs Fixed

- **Incompatible Change**: Failure to consider collation when comparing space characters could result in incorrect index entry order, leading to incorrect comparisons, inability to find some index values, misordered index entries, misordered `ORDER BY` results, or tables that `CHECK TABLE` reports as having corrupt indexes.

  As a result of this bug fix, indexes must be rebuilt for columns that use any of these character sets: `eucjpms`, `euc_kr`, `gb2312`, `latin7`, `macce`, `ujis`. See Checking Whether Tables or Indexes Must Be Rebuilt. (Bug #29461)

- **Incompatible Change**: Several issues were identified for stored programs (stored procedures and functions, triggers, and events) and views containing non-ASCII symbols. These issues involved conversion errors due to incomplete character set information when translating these objects to and from stored format, such as:

  - Parsing the original object definition so that it can be stored.
  - Compiling the stored definition into executable form when the object is invoked.
  - Retrieval of object definitions from `INFORMATION_SCHEMA` tables.
  - Displaying the object definition in `SHOW` statements. This issue also affected `mysqldump`, which uses `SHOW`.

  The fix for the problems is to store character set information from the object creation context so that this information is available when the object needs to be used later. The context includes the client character set, the connection character set and collation, and the collation of the database with which the object is associated.

  As a result of the patch, several tables have new columns:

  - In the `mysql` database, the `proc` and `event` tables now have these columns: `character_set_client` [464], `collation_connection` [466], `db_collation`, `body_utf8`.
  - In `INFORMATION_SCHEMA`, the `VIEWS` table now has these columns: `CHARACTER_SET_CLIENT`, `COLLATION_CONNECTION`. The `ROUTINES`, `TRIGGERS`, and `EVENTS` tables now have these columns: `CHARACTER_SET_CLIENT`, `COLLATION_CONNECTION`, `DATABASE_COLLATION`.

  These columns store the session values of the `character_set_client` [464] and `collation_connection` [466] system variables, and the collation of the database with which the object is associated. The values are those in effect at object creation time. (The saved database collation is not the value of the `collation_database` [466] system variable, which applies to the default database; the database that contains the object is not necessarily the default database.)

  Several `SHOW` statements now display additional columns corresponding to the new table columns. These statements are: `SHOW CREATE EVENT`, `SHOW CREATE FUNCTION`, `SHOW CREATE PROCEDURE`, `SHOW CREATE VIEW`, `SHOW EVENTS`, `SHOW FUNCTION STATUS`, `SHOW PROCEDURE STATUS`, `SHOW TRIGGERS`.

  A new statement, `SHOW CREATE TRIGGER` is introduced and is used by `mysqldump` for producing `CREATE TRIGGER` statements.

Subsequent to the patch just described, it was discovered that the patch broke `mysql_upgrade`; this has been corrected.

Important

The fixes for the problems just describe affect *all* existing stored programs and views. (For example, you will see warnings about “no creation context.”) To avoid warnings from the server about the use of old definitions from any release prior to 5.1.21, you should dump stored programs and views with `mysqldump` after upgrading to 5.1.21, and then reload them to recreate them with new definitions. Invoke `mysqldump` with a `--default-character-set` [295] option that names the non-ASCII character set that was used for the definitions when the objects were originally created, and the `--routines` [300], `--events` [296], and `--triggers` [302] options to dump stored program definitions. For more information about upgrading stored programs, see Upgrading from MySQL 5.0 to 5.1.

(Bug #25221, Bug #21249, Bug #30027, Bug #16291, Bug #11986, Bug #25212, Bug #19443, Bug #30029)

- **MySQL Cluster**: **Replication**: (Replication): Inconsistencies could occur between the master and the slave when replicating Disk Data tables. (Bug #19259, Bug #19227)
- **MySQL Cluster**: Replica redo logs were inconsistently handled during a system restart. (Bug #29354)
- **MySQL Cluster**: When restarting a data node, queries could hang during that node's start phase 5, and continue only after the node had entered phase 6. (Bug #29364)
- **MySQL Cluster**: The wrong data pages were sometimes invalidated following a global checkpoint. (Bug #29067)
- **MySQL Cluster**: An invalid comparison made during `REDO` validation that could lead to an `Error while reading REDO log` condition. (Bug #29118)
- **MySQL Cluster**: If a storage engine has its own logging capability, then any statement using both this engine and some other engine not having its own logging could not be correctly logged, due to the fact that entries from one engine could be logged before entries from the other engine were. This did not generate any error messages when it occurred.

  Now, if multiple storage engines are used in a statement and at least one of them has its own logging capability, then an error message is generated and the statement is not executed.

  Note

  Currently, the only storage engine to have its own logging capability is `NDBCLUSTER`.

  (Bug #28722)

- **MySQL Cluster**: `DELETE FROM table WHERE primary_key IN (value_list)`, where the `value_list` contained more than one value, called from an `AFTER DELETE` trigger on an `NDB` table, caused `mysqld` to crash. (Bug #30337)
- **MySQL Cluster**: If at least 2 files were involved in `REDO` invalidation, then file 0 of page 0 was not updated and so pointed to an invalid part of the redo log. (Bug #29057)
- **MySQL Cluster**: When a node failed to respond to a `COPY_GCI` signal as part of a global checkpoint, the master node was killed instead of the node that actually failed. (Bug #29331)

- **MySQL Cluster**: Warnings and errors generated by `ndb_config --config-file=file` were sent to `stdout`, rather than to `stderr`. (Bug #25941)
- **MySQL Cluster**: When a cluster backup was terminated using the `ABORT BACKUP` command in the management client, a misleading error message `Backup aborted by application: Permanent error: Internal error` was returned. The error message returned in such cases now reads `Backup aborted by user request`. (Bug #21052)
- **MySQL Cluster**: Large file support did not work in AIX server binaries. (Bug #10776)
- **Replication**: `INSERT DELAYED` statements on a master server are replicated as non-`DELAYED` inserts on slaves (which is normal, to preserve serialization), but the inserts on the slave did not use concurrent inserts. Now `INSERT DELAYED` on a slave is converted to a concurrent insert when possible, and to a normal insert otherwise. (Bug #29152)
- **Replication**: Storage engine error conditions in row-based replication were not correctly reported to the user. (Bug #29570)
- **Replication**: The thread ID was not reset properly after execution of `mysql_change_user()`, which could cause replication failure when replicating temporary tables. (Bug #29734)
- **Replication**: Using the `READ COMMITTED` [1224] transaction isolation level caused mixed and statement-based replication to fail. (Bug #23051)
- **Replication**: An error that happened inside `INSERT`, `UPDATE`, or `DELETE` statements performed from within a stored function or trigger could cause inconsistency between master and slave servers. (Bug #27417)
- **Replication**: Slave servers could incorrectly interpret an out-of-memory error from the master and reconnect using the wrong binary log position. (Bug #24192)
- **Disk Data**: When dropping a page, the stack's bottom entry could sometime be left “cold” rather than “hot”, violating the rules for stack pruning. (Bug #29176)
- **Disk Data**: Disk data meta-information that existed in `ndbd` might not be visible to `mysqld`. (Bug #28720)
- **Disk Data**: Performing Disk Data schema operations during a node restart could cause forced shutdowns of other data nodes. (Bug #29501)
- **Disk Data**: The number of free extents was incorrectly reported for some tablespaces. (Bug #28642)
- **Cluster Replication**: When executing a statement where `binlog_format = statement` [1654], the result of the statement was logged both as a statement and as rows. (Bug #29222)
- **Cluster Replication**: `mysqld` would segfault on startup when the `NDB` storage engine was enabled and the default character set was a strictly multi-byte character set such as UCS2.

  This issue does *not* apply to character sets that can contain single-byte characters in addition to multi-byte characters such as UTF-8.

  Additional issues remain with regard to the use of multi-byte character sets in MySQL Cluster Replication; see Known Issues in MySQL Cluster Replication, for more information. (Bug #27404)
- Results for a select query that aliases the column names against a view could duplicate one column while omitting another. This bug could occur for a query over a multiple-table view that includes an `ORDER BY` clause in its definition. (Bug #29392)
- Creating an event using `ON SCHEDULE AT CURRENT_TIMESTAMP + INTERVAL ...` could in some cases cause `mysqld` to crash. (Bug #28881)
- A left join between two views could produce incorrect results. (Bug #29604)

- Inserting a negative number into a `CSV` table could corrupt it. (Bug #29353)
- On Windows, the `mysql` client died if the user entered a statement and Return after entering **Control+C**. (Bug #29469)
- `ALTER VIEW` is not supported as a prepared statement but was not being rejected. `ALTER VIEW` is now prohibited as a prepared statement or when called within stored routines. (Bug #28846)
- For updates to `InnoDB` tables, a `TIMESTAMP` column with the `ON UPDATE CURRENT_TIMESTAMP` attribute could be updated even when no values actually changed. (Bug #29310)
- For a table with a `DATE` column *`date_col`* such that selecting rows with `WHERE` *`date_col`* `= '`*`date_val`*` 00:00:00'` yielded a nonempty result, adding `GROUP BY` *`date_col`* caused the result to be empty. (Bug #29729)
- For the `SHOW TABLE TYPES` statement, the server sent incorrect output to clients, possibly causing them to crash. (Bug #30036)
- Optimization of queries with `DETERMINISTIC` stored functions in the `WHERE` clause was ineffective: A sequential scan was always used. (Bug #29338)
- For `MyISAM` tables on Windows, `INSERT`, `DELETE`, or `UPDATE` followed by `ALTER TABLE` within `LOCK TABLES` could cause table corruption. (Bug #29957)
- If an `INSERT INTO ... SELECT` statement inserted into the same table that the `SELECT` retrieved from, and the `SELECT` included `ORDER BY` and `LIMIT` clauses, different data was inserted than the data produced by the `SELECT` executed by itself. (Bug #29095)
- An incorrect result was returned when comparing string values that were converted to `TIME` values with `CAST()` [1012]. (Bug #29555)
- `AsText()` could fail with a buffer overrun. (Bug #29166)
- Assertion failure could occur for grouping queries that employed `DECIMAL` user variables with assignments to them. (Bug #29417)
- A field packet with `NULL` fields caused a `libmysqlclient` crash. (Bug #29494)
- `mysqld_safe` produced error messages and did not create the error log file under some circumstances. (Bug #29634)
- Very long prepared statements in stored procedures could cause a server crash. (Bug #29856)
- Many threads accessing a `CSV` table simultaneously could cause an assertion failure. (Bug #29252)
- Coercion of ASCII values to character sets that are a superset of ASCII sometimes was not done, resulting in `illegal mix of collations` errors. These cases now are resolved using repertoire, a new string expression attribute (see String Repertoire). (Bug #28875)
- `FULLTEXT` indexes could be corrupted by certain `gbk` characters. (Bug #29299)
- `EXPLAIN` produced `Impossible where` for statements of the form `SELECT ... FROM t WHERE c=0`, where `c` was an `ENUM` column defined as a primary key. (Bug #29661)
- Searching a `FULLTEXT` index for a word with the boolean mode truncation operator could cause an infinite loop. (Bug #29445)
- Corrupt data resulted from use of `SELECT ... INTO OUTFILE '`*`file_name`*`' FIELDS ENCLOSED BY '`*`c`*`'`, where *`c`* is a digit or minus sign, followed by `LOAD DATA INFILE '`*`file_name`*`' FIELDS ENCLOSED BY '`*`c`*`'`. (Bug #29442)
- Fast `ALTER TABLE` (that works without rebuilding the table) acquired duplicate locks in the storage engine. In `MyISAM`, if `ALTER TABLE` was issued under `LOCK TABLE`, it caused all data inserted after `LOCK TABLE` to disappear. (Bug #28838)

- On Windows, client libraries lacked symbols required for linking. (Bug #30118)
- Mixing binary and `utf8` columns in a union caused field lengths to be calculated incorrectly, resulting in truncation. (Bug #29205)
- A maximum of 4TB `InnoDB` free space was reported by `SHOW TABLE STATUS,` which is incorrect on systems with more than 4TB space. (Bug #29097)
- Sort order of the collation wasn't used when comparing trailing spaces. This could lead to incorrect comparison results, incorrectly created indexes, or incorrect result set order for queries that include an `ORDER BY` clause. (Bug #29261)
- On 64-bit platforms, the filesort code (for queries with `GROUP BY` or `ORDER BY`) could crash due to an incorrect pointer size. (Bug #29610)
- Inserting into `InnoDB` tables and executing `RESET MASTER` in multiple threads cause assertion failure in debug server binaries. (Bug #28983)
- Use of `SHOW BINLOG EVENTS` for a nonexistent log file followed by `PURGE BINARY LOGS` caused a server crash. (Bug #29420)
- `LOCK TABLES` did not pre-lock tables used in triggers of the locked tables. Unexpected locking behavior and statement failures similar to `failed: 1100: Table 'xx' was not locked with LOCK TABLES` could result. (Bug #29929)
- Under some circumstances, a `SELECT ... FROM mysql.event` could cause the server to crash. (Bug #29156)
- Use of local variables with non-ASCII names in stored procedures crashed the server. (Bug #30120)
- If an `ENUM` column contained `''` as one of its members (represented with numeric value greater than 0), and the column contained error values (represented as 0 and displayed as `''`), using `ALTER TABLE` to modify the column definition caused the 0 values to be given the numeric value of the nonzero `''` member. (Bug #29251)
- An assertion failure occurred within yaSSL for very long keys. (Bug #29784)

  References: See also Bug #53463.
- `CHECK TABLE` could erroneously report table corruption for a `CSV` table if multiple threads were modifying the table at the same time. (Bug #29253)
- Runtime changes to the `log_queries_not_using_indexes` [490] system variable were ignored. (Bug #28808)
- On Windows, the `CMake` build process did not produce the embedded server library or related binaries. (Bug #29903)
- The semantics of `BIGINT` depended on platform-specific characteristics. (Bug #29079)
- An assertion failure occurred if a query contained a conjunctive predicate of the form *`view_column`* `= constant` in the `WHERE` clause and the `GROUP BY` clause contained a reference to a different view column. The fix also enables application of an optimization that was being skipped if a query contained a conjunctive predicate of the form *`view_column`* `= constant` in the `WHERE` clause and the `GROUP BY` clause contained a reference to the same view column. (Bug #29104)
- `SESSION_USER()` [1039] returned garbage data (rather than the correct value of the empty string) when executed by a slave SQL thread. (Bug #29878)
- `mysqldump` produced output that incorrectly discarded the `NO_AUTO_VALUE_ON_ZERO` [573] value of the `sql_mode` [526] variable after dumping triggers. (Bug #29788)
- Calling `mysql_options()` after `mysql_real_connect()` could cause clients to crash. (Bug #29247)

- For a join with `GROUP BY` or `ORDER BY` and a view reference in the `FROM` list, the query metadata erroneously showed empty table aliases and database names for the view columns. (Bug #28898)
- `REPAIR TABLE ... USE_FRM` could corrupt tables. (Bug #29980)
- Repeatedly accessing a view in a stored procedure (for example, in a loop) caused a small amount of memory to be allocated per access. Although this memory is deallocated on disconnect, it could be a problem for a long running stored procedures that make repeated access of views. (Bug #29834)
- `mysqld` failed to exit during shutdown. (Bug #29133)
- For a `ucs2` column, `GROUP_CONCAT()` [1046] did not convert separators to the result character set before inserting them, producing a result containing a mixture of two different character sets. (Bug #28925)
- Adding `DISTINCT` could cause incorrect rows to appear in a query result. (Bug #29911)
- On Windows, `ALTER TABLE` hung if records were locked in share mode by a long-running transaction. (Bug #29644)
- Killing an `INSERT DELAYED` thread caused a server crash. (Bug #29431)
- Deleting from a `CSV` table could corrupt it. (Bug #29411)
- Single-row inserts could report a row count greater than one. (Bug #29692)
- Creation of a legal stored procedure could fail if no default database had been selected. (Bug #29050)
- The `IS_UPDATABLE` column in the `INFORMATION_SCHEMA.VIEWS` table was not always set correctly. (Bug #30020)
- `InnoDB` refused to start on some versions of FreeBSD with LinuxThreads. This is fixed by enabling file locking on FreeBSD. (Bug #29155)
- `INSERT ... VALUES(CONNECTION_ID(), ...)` statements were written to the binary log in such a way that they could not be properly restored. (Bug #29928)
- In some cases, `INSERT INTO ... SELECT ... GROUP BY` could insert rows even if the `SELECT` by itself produced an empty result. (Bug #29717)
- Comparison of `TIME` values using the `BETWEEN` [941] operator led to string comparison, producing incorrect results in some cases. Now the values are compared as integers. (Bug #29739)
- Certain statements with unions, subqueries, and joins could result in huge memory consumption. (Bug #29582)
- A byte-order issue in writing a spatial index to disk caused bad index files on some systems. (Bug #29070)
- `LOCK TABLES` was not atomic when more than one `InnoDB` tables were locked. (Bug #29154)
- Prepared statements containing `CONNECTION_ID()` [1033] could be written improperly to the binary log. (Bug #30200)
- If one thread was performing concurrent inserts, other threads reading from the same table using equality key searches could see the index values for new rows before the data values had been written, leading to reports of table corruption. (Bug #29838)
- Dropping the definer of an active event caused the server to crash. (Bug #28924)
- Queries that performed a lookup into a `BINARY` index containing key values ending with spaces caused an assertion failure for debug builds and incorrect results for nondebug builds. (Bug #29087)

- Updates to a `CSV` table could cause a server crash or update the table with incorrect values. (Bug #28971)
- `MyISAM` corruption could occur with the `cp932_japanese_ci` collation for the `cp932` character set due to incorrect comparison for trailing space. (Bug #29333)
- In the `ascii` character set, conversion of DEL (`0x7F`) to Unicode incorrectly resulted in QUESTION MARK (`0x3F`) rather than DEL. (Bug #29499)
- The special "zero" `ENUM` value was coerced to the normal empty string `ENUM` value during a column-to-column copy. This affected `CREATE ... SELECT` statements and `SELECT` statements with aggregate functions on `ENUM` columns in the `GROUP BY` clause. (Bug #29360)
- For the embedded server, the `mysql_stmt_store_result()` C API function caused a memory leak for empty result sets. (Bug #29687)
- In strict SQL mode, errors silently stopped the SQL thread even for errors named using the `--slave-skip-errors` option. (Bug #28839)
- Using the `DATE()` [982] function in a `WHERE` clause did not return any records after encountering `NULL`. However, using `TRIM()` [958] or `CAST()` [1012] produced the correct results. (Bug #29898)
- `CHECK TABLE` for `ARCHIVE` tables could falsely report table corruption or cause a server crash. (Bug #29207)
- A slave running with `--log-slave-updates` [1628] would fail to write `INSERT DELAY IGNORE` statements to its binary log, resulting in different binary log contents on the master and slave. (Bug #29571)
- Selecting a column not present in the selected-from table caused an extra error to be produced by `SHOW ERRORS`. (Bug #28677)
- A network structure was initialized incorrectly, leading to embedded server crashes. (Bug #29117)
- Executing `ALTER EVENT` on an event whose definer's event creation privileges had been revoked cause the server to crash. (Bug #28873)
- `gcov` coverage-testing information was not written if the server crashed. (Bug #29543)
- `SHOW` statements were being written to the slow query log that should not have been. (Bug #30000)
- For `MEMORY` tables, the `index_merge` [697] union access method could return incorrect results. (Bug #29740)
- Clients using SSL could hang the server. (Bug #29579)
- For `CAST(expr AS DECIMAL(M,D))` [1012], the limits of 65 and 30 on the precision (*`M`*) and scale (*`D`*) were not enforced. (Bug #29415)
- If query execution involved a temporary table, `GROUP_CONCAT()` [1046] could return a result with an incorrect character set. (Bug #29850)
- `SELECT ... INTO OUTFILE` followed by `LOAD DATA` could result in garbled characters when the `FIELDS ENCLOSED BY` clause named a delimiter of `'0'`, `'b'`, `'n'`, `'r'`, `'t'`, `'N'`, or `'Z'` due to an interaction of character encoding and doubling for data values containing the enclosed-by character. (Bug #29294)
- The full-text parser could enter an infinite loop if it encountered an illegal multi-byte sequence or a sequence that has no mapping to Unicode. (Bug #29464)
- `mysqldump` created a stray file when a given a too-long file name argument. (Bug #29361)
- `--myisam-recover=''` (empty option value) did not disable `MyISAM` recovery. (Bug #30088)

- `REPLACE`, `INSERT IGNORE`, and `UPDATE IGNORE` did not work for `FEDERATED` tables. (Bug #29019)

- Index creation could corrupt the table definition in the `.frm` file: 1) A table with the maximum number of key segments and maximum length key name would have a corrupted `.frm` file, due to incorrect calculation of the total key length. 2) `MyISAM` would reject a table with the maximum number of keys and the maximum number of key segments in all keys. (It would permit one less than this total maximum.) Now `MyISAM` accepts a table defined with the maximum. (Bug #26642)

- A query with `DISTINCT` in the select list to which the loose-scan optimization for grouping queries was applied returned an incorrect result set when the query was used with the `SQL_BIG_RESULT` option. (Bug #25602)

- `mysqlbinlog --hexdump` generated incorrect output due to omission of the "`#`" comment character for some comment lines. (Bug #28293)

- Instance Manager had a race condition when it received a shutdown request while a guarded `mysqld` instance was starting such that it could fail to stop the `mysqld` instance. (Bug #28030)

- For a statement of the form `CREATE t1 SELECT integer_constant`, the server created the column using the `DECIMAL` data type for large negative values that are within the range of `BIGINT`. (Bug #28625)

- A duplicate-key error message could display an incorrect key value when not all columns of the key were used to select rows for update. (Bug #28158)

- Using the `--skip-add-drop-table` [293]option with `mysqldump` generated incorrect SQL if the database included any views. The recreation of views requires the creation and removal of temporary tables. This option suppressed the removal of those temporary tables. The same applied to `--compact` [294] since this option also invokes `--skip-add-drop-table` [293]. (Bug #28524)

- Indexing column prefixes in `InnoDB` tables could cause table corruption. (Bug #28138)

- For a multiple-row insert into a `FEDERATED` table that refers to a remote transactional table, if the insert failed for a row due to constraint failure, the remote table would contain a partial commit (the rows preceding the failed one) instead of rolling back the statement completely. This occurred because the rows were treated as individual inserts.

  Now `FEDERATED` performs bulk-insert handling such that multiple rows are sent to the remote table in a batch. This provides a performance improvement and enables the remote table to perform statement rollback properly should an error occur. This capability has the following limitations:

  - The size of the insert cannot exceed the maximum packet size between servers. If the insert exceeds this size, it is broken into multiple packets and the rollback problem can occur.

  - Bulk-insert handling does not occur for `INSERT ... ON DUPLICATE KEY UPDATE`.

  (Bug #25513)

- `InnoDB` could crash if the server was shut down while `innodb_table_monitor` was running. (Bug #28254)

- The Windows implementation of `pthread_join()` was incorrect and could cause crashes. (Bug #26564)

- Index creation could fail due to truncation of key values to the maximum key length rather than to a multiple of the maximum character length. (Bug #28125)

- Updates to rows in a partitioned table could update the wrong column. (Bug #26827)

- `SHOW INNODB STATUS` caused an assertion failure under high load. (Bug #22819)

- Dropping a temporary `InnoDB` table that had been locked with `LOCK TABLES` caused a server crash. (Bug #24918)
- When using a `FEDERATED` table, the value of `LAST_INSERT_ID()` [1036] would not correctly update the C API interface, which would affect the autogenerated ID returned both through the C API and the MySQL protocol, affecting Connectors that used the protocol or C API. (Bug #25714)
- After the first read of a `TEMPORARY` table, `CHECK TABLE` could report the table as being corrupt. (Bug #26325)
- On Windows, the server used 10MB of memory for each connection thread, resulting in memory exhaustion. Now each thread uses 1MB. (Bug #20815)
- `SELECT ... FOR UPDATE` with partitioned tables could cause a server crash. (Bug #28026)
- If an operation had an `InnoDB` table, and two triggers, `AFTER UPDATE` and `AFTER INSERT`, competing for different resources (such as two distinct `MyISAM` tables), the triggers were unable to execute concurrently. In addition, `INSERT` and `UPDATE` statements for the `InnoDB` table were unable to run concurrently. (Bug #26141)
- A number of unsupported constructs—including prohibited constructs, the `UCASE()` [958] function, and nested function calls—were permitted in partitioning expressions. (Bug #26082, Bug #18198, Bug #29308)
- The server was blocked from opening other tables while the `FEDERATED` engine was attempting to open a remote table. Now the server does not check the correctness of a `FEDERATED` table at `CREATE TABLE` time, but waits until the table actually is accessed. (Bug #25679)
- The index merge union access algorithm could produce incorrect results with `InnoDB` tables. The problem could also occur for queries that used `DISTINCT`. (Bug #25798)
- For some event-creation problems, the server displayed messages that implied the problems were errors when they were only warnings. (Bug #27406)
- If a stored procedure was created and invoked prior to selecting a default database with `USE`, a `No database selected` error occurred. (Bug #28551)
- The `FEDERATED` storage engine failed silently for `INSERT ... ON DUPLICATE KEY UPDATE` if a duplicate key violation occurred. `FEDERATED` does not support `ON DUPLICATE KEY UPDATE`, so now it correctly returns an `ER_DUP_KEY` [3958] error if a duplicate key violation occurs. (Bug #25511)
- Under ActiveState Perl, `mysql-test-run.pl` could kill itself when attempting to kill other processes. (Bug #25657)
- Unsafe aliasing in the source caused a client library crash when compiled with `gcc` 4 at high optimization levels. (Bug #27383)
- Index-based range reads could fail for comparisons that involved contraction characters (such as `ch` in Czech or `ll` in Spanish). (Bug #27345)
- Some functions when used in partitioning expressions could cause `mysqld` to crash. (Bug #27084)
- Dropping a user-defined function could cause a server crash if the function was still in use by another thread. (Bug #27564)
- If MySQL/`InnoDB` crashed very quickly after starting up, it would not force a checkpoint. In this case, `InnoDB` would skip crash recovery at next startup, and the database would become corrupt. Now, if the redo log scan at `InnoDB` startup goes past the last checkpoint, crash recovery is forced. (Bug #23710)
- Aggregations in subqueries that refer to outer query columns were not always correctly referenced to the proper outer query. (Bug #27333)

- The `LOCATE()` [954] function returned `NULL` if any of its arguments evaluated to `NULL`. Likewise, the predicate, `LOCATE(str,NULL) IS NULL` [954], erroneously evaluated to `FALSE`. (Bug #27932)
- In a stored function or trigger, when `InnoDB` detected deadlock, it attempted rollback and displayed an incorrect error message (`Explicit or implicit commit is not permitted in stored function or trigger`). Now `InnoDB` returns an error under these conditions and does not attempt rollback. Rollback is handled outside of `InnoDB` above the function/trigger level. (Bug #24989)
- For `InnoDB` tables, MySQL unnecessarily sorted records in certain cases when the records were retrieved by `InnoDB` in the proper order already. (Bug #28591)
- On Windows, executables did not include Vista manifests. (Bug #24732)

  References: See also Bug #22563.
- Error returns from the `time()` system call were ignored. (Bug #27198)
- `InnoDB` displayed an incorrect error message when a `CREATE TABLE` statement exceeded the `InnoDB` maximum permissible row size. (Bug #21101)
- `mysql_install_db` could fail to find script files that it needs. (Bug #28585)
- The server acquired a global mutex for temporary tables, although such tables are thread-specific. This affected performance by blocking other threads. (Bug #27062)
- `ALTER DATABASE` did not require at least one option. (Bug #25859)
- The `SUBSTRING()` [957] function returned the entire string instead of an empty string when it was called from a stored procedure and when the length parameter was specified by a variable with the value "`0`". (Bug #27130)
- Several `InnoDB` assertion failures were corrected. (Bug #25645)
- Under heavy load with a large query cache, invalidating part of the cache could cause the server to freeze (that is, to be unable to service other operations until the invalidation was complete). (Bug #21074)

  References: See also Bug #39253.
- `FEDERATED` tables had an artificially low maximum of key length. (Bug #26909)
- A race condition in the interaction between `MyISAM` and the query cache code caused the query cache not to invalidate itself for concurrently inserted data. (Bug #28249)
- On Windows, Instance Manager would crash if an instance object failed to initialize during startup. This could happen if an incorrect `mysqld` path was supplied in the configuration file. (Bug #28012)
- When determining which transaction to kill after deadlock has been detected, `InnoDB` now adds the number of locks to a transaction's weight, and avoids killing transactions that mave modified nontransactional tables. This should reduce the likelihood of killing long-running transactions containing `SELECT ... FOR UPDATE` or `INSERT/REPLACE INTO ... SELECT` statements, and of causing partial updates if the target is a `MyISAM` table. (Bug #21293)
- `SHOW BINLOG EVENTS` displayed incorrect values of `End_log_pos` for events associated with transactional storage engines. (Bug #22540)
- On Mac OS X, shared-library installation path names were incorrect. (Bug #28544)
- Creating an event to be executed at a time close to the end of the permitted range (2038-01-19 03:14:07 UTC) would cause the server to crash. (Bug #28641)
- Phantom reads could occur under `InnoDB` `SERIALIZABLE` [1225] isolation level. (Bug #27197)

- Starting the server with an `innodb_force_recovery` [1370] value of 4 did not work. (Bug #28604)
- Under ActiveState Perl, `mysql-test-run.pl` would not run. (Bug #18415)
- `mysql_setpermission` tried to grant global-only privileges at the database level. (Bug #14618)
- If a slave timed out while registering with the master to which it was connecting, auto-reconnect failed thereafter. (Bug #19328)
- The server crashed when the size of an `ARCHIVE` table grew larger than 2GB. (Bug #15787)
- On 64-bit Windows systems, the Config Wizard failed to complete the setup because 64-bit Windows does not resolve dynamic linking of the 64-bit `libmysql.dll` to a 32-bit application like the Config Wizard. (Bug #14649)
- For the general query log, logging of prepared statements executed using the C API differed from logging of prepared statements performed with `PREPARE` and `EXECUTE`. Logging for the latter was missing the `Prepare` and `Execute` lines. (Bug #13326)
- If `InnoDB` reached its limit on the number of concurrent transactions (1023), it wrote a descriptive message to the error log but returned a misleading error message to the client, or an assertion failure occurred. (Bug #18828)

  References: See also Bug #46672.
- `InnoDB` produced an unnecessary (and harmless) warning: `InnoDB: Error: trying to declare trx to enter InnoDB, but InnoDB: it already is declared`. (Bug #20090)
- `SQL_BIG_RESULT` had no effect for `CREATE TABLE ... SELECT SQL_BIG_RESULT ...` statements. (Bug #15130)
- The server returned data from `SHOW CREATE TABLE` statement or a `SELECT` statement on an `INFORMATION_SCHEMA` table using the `binary` character set. (Bug #10491)
- Backup software can cause `ERROR_SHARING_VIOLATION` or `ERROR_LOCK_VIOLATION` conditions during file operations. `InnoDB` now retries forever until the condition goes away. (Bug #9709)
- The `TABLE_COMMENT` column of `INFORMATION_SCHEMA.TABLES` and the `Comment` column in the output of `SHOW TABLE STATUS` displayed extraneous information for `InnoDB` and `NDBCLUSTER` tables. (Bug #11379)

  References: See also Bug #32440.

Changes in MySQL 5.1.20 (2007-06-25)

This is a new Beta development release, fixing recently discovered bugs.

Note

This Beta release, as any other pre-production release, should not be installed on *production* level systems or systems with critical data. It is good practice to back up your data before installing any new version of software. Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at http://bugs.mysql.com/ for more details about the individual bugs fixed in this version.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details, please see http://www.mysql.com/products/enterprise.

Functionality Added or Changed

- **Incompatible Change**: It is no longer possible to partition the log tables. (Bug #27816)

- **Incompatible Change**: `mysqld_safe` now supports error logging to `syslog` on systems that support the `logger` command. The new `--syslog` [242] and `--skip-syslog` [242] options can be used instead of the `--log-error` [242] option to control logging behavior, as described in `mysqld_safe` — MySQL Server Startup Script. The default is to use `syslog`, which differs from the previous default behavior of writing an error log file.

  Currently, logging to `syslog` may fail to operate correctly in some cases; if so, use `--skip-syslog` [242] or `--log-error` [242]. To maintain the older behavior if you were using no error-logging option, use `--skip-syslog` [242]. If you were using `--log-error` [242], continue to use it.

  Note: In 5.1.21, the default is changed to `--skip-syslog` [242], which is compatible with releases prior to 5.1.20. (Bug #4858)

- **Important Change**: **MySQL Cluster**: The `TimeBetweenWatchdogCheckInitial` [1835] configuration parameter was added to enable setting of a separate watchdog timeout for memory allocation during startup of the data nodes. (Bug #28899)

- **MySQL Cluster**: The cluster management client now stores command history between sessions. (Bug #29073)

- **MySQL Cluster**: `auto_increment_increment` [1622] and `auto_increment_offset` [1624] are now supported for `NDB` tables. (Bug #26342)

- **MySQL Cluster**: The server source tree now includes scripts to simplify building MySQL with SCI support. For more information about SCI interconnects and these build scripts, see Configuring MySQL Cluster to use SCI Sockets. (Bug #25470)

- **MySQL Cluster**: A new configuration parameter `ODirect` [1833] causes `NDB` to attempt using `O_DIRECT` writes for LCP, backups, and redo logs, often lowering CPU usage.

- **Replication**: The `sql_mode` [526], `foreign_key_checks` [475], `unique_checks` [536], character set/collations, and `sql_auto_is_null` [524] session variables are written to the binary log and honored during replication. See The Binary Log.

- If a `MERGE` table cannot be opened or used because of a problem with an underlying table, `CHECK TABLE` now displays information about which table caused the problem. (Bug #26976)

- User variables and stored procedure variables are now supported for use in XPath expressions employed as arguments to the `ExtractValue()` [1016] and `UpdateXML()` [1018] functions.

  This means that:

  - XPath can now be used to load data from XML files using virtually any format, and so able to import data from most third party software which either has XML export functionality, or uses XML natively as a storage format.

  - Various complex conditions can be put on rows and columns, so one can filter for desired rows (or skip unwanted rows) when loading XML.

  - Various types of preprocessing using SQL functions are now possible when loading XML. For example, you can concatenate two XML tag or attribute values into a single column value using `CONCAT()` [951], or remove some parts of the data using `REPLACE()` [956].

  See XML Functions, for more information. (Bug #26518)

- Binary distributions for some platforms did not include shared libraries; now shared libraries are shipped for all platforms except AIX 5.2 64-bit. *Exception*: The library for the `libmysqld` embedded server is not shared except on Windows. (Bug #16520, Bug #26767, Bug #13450)

- Various types of preprocessing using SQL functions are now possible when loading XML. For example, you can concatenate two XML tag or attribute values into a single column value using `CONCAT()` [951], or remove some parts of the data using `REPLACE()` [956].
- Various complex conditions can be put on rows and columns, so one can filter for desired rows (or skip unwanted rows) when loading XML.
- XPath can now be used to load data from XML files using virtually any format, and so able to import data from most third party software which either has XML export functionality, or uses XML natively as a storage format.
- Added a new `PAD_CHAR_TO_FULL_LENGTH` [575] SQL mode. By default, trailing spaces are trimmed from `CHAR` column values on retrieval. If `PAD_CHAR_TO_FULL_LENGTH` [575] is enabled, trimming does not occur and retrieved `CHAR` values are padded to their full length. This mode does not apply to `VARCHAR` columns, for which trailing spaces are retained on retrieval.

Bugs Fixed

- **Security Fix**: A malformed password packet in the connection protocol could cause the server to crash. Thanks for Dormando for reporting this bug, and for providing details and a proof of concept. (Bug #28984, CVE-2007-3780)
- **Security Fix**: `CREATE TABLE LIKE` did not require any privileges on the source table. Now it requires the `SELECT` [627] privilege.

  In addition, `CREATE TABLE LIKE` was not isolated from alteration by other connections, which resulted in various errors and incorrect binary log order when trying to execute concurrently a `CREATE TABLE LIKE` statement and either DDL statements on the source table or DML or DDL statements on the target table. (Bug #23667, Bug #25578, CVE-2007-3781)
- **Incompatible Change**: Some error codes had error numbers in MySQL 5.1 different from the numbers in MySQL 5.0. In MySQL 5.1, error numbers have been changed to match the MySQL 5.0 values: Error codes with value of 1458 or higher have changed in MySQL 5.1 now. Client applications designed to work with MySQL 5.1 with hard-coded error code values (for example, in statements such as `if (mysql_errno(mysql) == 1463) { ... }`) need to be updated in the source code. All clients designed to work with MySQL 5.1 that test error codes (for example, in statements such as `if (mysql_errno(mysql) == ER_VIEW_RECURSIVE) { ... }`) should be recompiled. Existing 5.0 clients should now work, without changes or recompilation, against servers for MySQL 5.1.20 or higher. (Bug #29245)
- **Incompatible Change**: The use of an `ORDER BY` or `DISTINCT` clause with a query containing a call to the `GROUP_CONCAT()` [1046] function caused results from previous queries to be redisplayed in the current result. The fix for this includes replacing a `BLOB` value used internally for sorting with a `VARCHAR`. This means that for long results (more than 65,535 bytes), it is possible for truncation to occur; if so, an appropriate warning is issued. (Bug #23856, Bug #28273)
- **Incompatible Change**: The names of stored functions referenced by views were not properly displayed by `SHOW CREATE VIEW`.

  The fix corrects a problem introduced by Bug #23491. There is an incompatibility when upgrading from versions affected by that bug fix (MySQL 5.0.40 through 5.0.43, MySQL 5.1.18 through 5.1.19): If you use `mysqldump` before upgrading from an affected version and reload the data after upgrading to a higher version, you must drop and recreate your views. (Bug #28605)
- **Incompatible Change**: When `mysqldump` was run with the `--delete-master-logs` [296] option, binary log files were deleted before it was known that the dump had succeeded, not after. (The method for removing log files used `RESET MASTER` prior to the dump. This also reset the binary log sequence numbering to `.000001`.) Now `mysqldump` flushes the logs (which creates a new binary log number with the next sequence number), performs the dump, and then uses `PURGE BINARY LOGS` to remove the log files older than the new one. This also preserves log numbering because the

new log with the next number is generated and only the preceding logs are removed. However, this may affect applications if they rely on the log numbering sequence being reset. (Bug #24733)

- **MySQL Cluster**: **Replication**: (Replication): A replicated unique key permitted duplicate key inserts on the slave. (Bug #27044)
- **MySQL Cluster**: Having large amounts of memory locked caused swapping to disk. (Bug #28751)
- **MySQL Cluster**: When shutting down `mysqld`, the `NDB` binlog process was not shut down before log cleanup began. (Bug #28949)
- **MySQL Cluster**: `ndb_mgm` could hang when connecting to a nonexistent host. (Bug #28847)
- **MySQL Cluster**: Setting `InitialNoOfOpenFiles` [1827] equal to `MaxNoOfOpenFiles` [1827] caused an error. This was due to the fact that the actual value of `MaxNoOfOpenFiles` [1827] as used by the cluster was offset by 1 from the value set in `config.ini`. (Bug #28749)
- **MySQL Cluster**: It is now possible to set the maximum size of the allocation unit for table memory using the `MaxAllocate` [1825] configuration parameter. (Bug #29044)
- **MySQL Cluster**: A corrupt schema file could cause a `File already open` error. (Bug #28770)
- **MySQL Cluster**: `ndb_error_reporter` now preserves timestamps on files. (Bug #29074)
- **MySQL Cluster**: LCP files were not removed following an initial system restart. (Bug #28726)
- **MySQL Cluster**: A regression in the heartbeat monitoring code could lead to node failure under high load. This issue affected MySQL 5.1.19 and MySQL Cluster NDB 6.1.10 only. (Bug #28783)
- **MySQL Cluster**: A race condition could result when nonmaster nodes (in addition to the master node) tried to update active status due to a local checkpoint (that is, between `NODE_FAILREP` and `COPY_GCIREQ` events). Now only the master updates the active status. (Bug #28717)
- **MySQL Cluster**: Memory corruption could occur due to a problem in the `DBTUP` kernel block. (Bug #29229)
- **MySQL Cluster**: Attempting to restore a `NULL` row to a `VARBINARY` column caused `ndb_restore` to fail. (Bug #29103)
- **MySQL Cluster**: In the event that two data nodes in the same node group and participating in a GCP crashed before they had written their respective `P0.sysfile` files, `QMGR` could refuse to start, issuing an invalid `Insufficient nodes for restart` error instead. (Bug #29167)
- **MySQL Cluster**: `UPDATE IGNORE` statements involving the primary keys of multiple tables could result in data corruption. (Bug #28719)
- **MySQL Cluster**: A query having a large `IN(...)` [942] or `NOT IN(...)` list in the `WHERE` condition on an `NDB` table could cause `mysqld` to crash. (Bug #29185)
- **MySQL Cluster**: A fast global checkpoint under high load with high usage of the redo buffer caused data nodes to fail. (Bug #28653)
- **MySQL Cluster**: The management client's response to `START BACKUP WAIT COMPLETED` did not include the backup ID. (Bug #27640)
- **Cluster Replication**: **Replication**: When replicating `MyISAM` or `InnoDB` tables to a MySQL Cluster, it was not possible to determine exactly what had been applied following a shutdown of the slave cluster or `mysqld` process. (Bug #26783)
- **Replication**: Using events in replication could cause the slave to crash. (Bug #28953)
- **Replication**: `DROP USER` statements that named multiple users, only some of which could be dropped, were replicated incorrectly. (Bug #29030)

- **Replication**: It was possible to set `SQL_SLAVE_SKIP_COUNTER` such that the slave would jump into the middle of an event group. (Bug #28618)

  References: See also Bug #12691.

- **Replication**: Recreating a view that already exists on the master would cause a replicating slave to terminate replication with a 'different error message on slave and master' error. (Bug #28244)

- **Replication**: The result of executing of a prepared statement created with `PREPARE s FROM "SELECT 1 LIMIT ?"` was not replicated correctly. (Bug #28464)

- **Replication**: When using transactions and replication, shutting down the master in the middle of a transaction would cause all slaves to stop replicating. (Bug #22725)

- **Replication**: Connections from one `mysqld` server to another failed on Mac OS X, affecting replication and `FEDERATED` tables. (Bug #26664)

  References: See also Bug #29083.

- **Replication**: Binary logging of prepared statements could produce syntactically incorrect queries in the binary log, replacing some parameters with variable names rather than variable values. This could lead to incorrect results on replication slaves. (Bug #26842, Bug #12826)

- **Replication**: Using `CREATE TABLE LIKE ...` would raise an assertion when replicated to a slave. (Bug #18950)

- **Disk Data**: Repeated `INSERT` and `DELETE` operations on a Disk Data table having one or more large `VARCHAR` columns could cause data nodes to fail. (Bug #20612)

- **Disk Data**: When loading data into a cluster following a version upgrade, the data nodes could forcibly shut down due to page and buffer management failures (that is, `ndbrequire` failures in `PGMAN`). (Bug #28525)

- **Cluster API**: An invalid error code could be set on transaction objects by `BLOB` handling code. (Bug #28724)

- **Cluster API**: The timeout set using the MGM API `ndb_mgm_set_timeout()` function was incorrectly interpreted as seconds rather than as milliseconds. (Bug #29063)

- Running `SHOW TABLE STATUS` while performing a high number of inserts on partitioned tables with a great many partitions could cause the server to crash. (Bug #28806)

- Long path names for internal temporary tables could cause stack overflows. (Bug #29015)

- Non-`utf8` characters could get mangled when stored in `CSV` tables. (Bug #28862)

- Using `BETWEEN` [941] with nonindexed date columns and short formats of the date string could return incorrect results. (Bug #28778)

- If a program binds a given number of parameters to a prepared statement handle and then somehow changes `stmt->param_count` to a different number, `mysql_stmt_execute()` could crash the client or server. (Bug #28934)

- The result of evaluation for a view's `CHECK OPTION` option over an updated record and records of merged tables was arbitrary and dependent on the order of records in the merged tables during the execution of the `SELECT` statement. (Bug #28716)

- A subquery with `ORDER BY` and `LIMIT 1` could cause a server crash. (Bug #28811)

- When constructing the path to the original `.frm` file, `ALTER .. RENAME` was unnecessarily (and incorrectly) lowercasing the entire path when not on a case-insensitive file system, causing the statement to fail. (Bug #28754)

- Searches on indexed and nonindexed `ENUM` columns could return different results for empty strings. (Bug #28729)
- Using a `VIEW` created with a nonexisting `DEFINER` could lead to incorrect results under some circumstances. (Bug #28895)
- If one of the queries in a `UNION` used the `SQL_CACHE` option and another query in the `UNION` contained a nondeterministic function, the result was still cached. For example, this query was incorrectly cached:

  ```
  SELECT NOW() FROM t1 UNION SELECT SQL_CACHE 1 FROM t1;
  ```

  (Bug #29053)
- The `binlog_format` [1654] system variable value was empty if the server was started with binary logging disabled. Now it is set to `MIXED`. (Bug #28752)
- On Windows, `USE_TLS` was not defined for `mysqlclient.lib`. (Bug #28860)
- Selecting `GEOMETRY` columns in a `UNION` caused a server crash. (Bug #28763)
- The “manager thread” of the LinuxThreads implementation was unintentionally started before `mysqld` had dropped privileges (to run as an unprivileged user). This caused signaling between threads in `mysqld` to fail when the privileges were finally dropped. (Bug #28690)
- The `TRUNCATE TABLE` statement was handled differently by the server when row-based logging was in effect, even though the binlogging format in effect does not effect the fact that `TRUNCATE TABLE` is always logged as a statement. (Bug #29130)
- Queries that used `UUID()` [1042] were incorrectly permitted into the query cache. (This should not happen because `UUID()` [1042] is nondeterministic.) (Bug #28897)
- In MySQL 5.1.15, a new error code `ER_DUP_ENTRY_WITH_KEY_NAME` [3994] (1582) was introduced to replace `ER_DUP_ENTRY` [3960] (1062) so that the key name could be provided instead of the key number. This was unnecessary, so `ER_DUP_ENTRY` [3960] is used again and the key name is printed. The incompatibility introduced in 5.1.15 no longer applies. (Bug #28842)
- Using an `INTEGER` column from a table to `ROUND()` [977] a number produced different results than using a constant with the same value as the `INTEGER` column. (Bug #28980)
- Executing `EXPLAIN EXTENDED` on a query using a derived table over a grouping subselect could lead to a server crash. This occurred only when materialization of the derived tables required creation of an auxiliary temporary table, an example being when a grouping operation was carried out with usage of a temporary table. (Bug #28728)
- `INSERT .. ON DUPLICATE KEY UPDATE` could under some circumstances silently update rows when it should not have. (Bug #28904)
- Queries using UDFs or stored functions were cached. (Bug #28921)
- For `InnoDB` tables that use the `utf8` character set, incorrect results could occur for DML statements such as `DELETE` or `UPDATE` that use an index on character-based columns. (Bug #28878)

  References: See also Bug #29449, Bug #30485, Bug #31395. This bug was introduced by Bug #13195.
- The query `SELECT '2007-01-01' + INTERVAL column_name DAY FROM table_name` caused `mysqld` to fail. (Bug #28450)
- When `ALTER TABLE` was used to add a new `DATE` column with no explicit default value, `'0000-00-00'` was used as the default even if the SQL mode included the `NO_ZERO_DATE` [575] mode to prohibit that value. A similar problem occurred for `DATETIME` columns. (Bug #27507)

- A `FLUSH TABLES WITH READ LOCK` statement followed by a `FLUSH LOGS` statement caused a deadlock if the general log or the slow query log was enabled. (Bug #26380)
- Performing `ALTER TABLE ... ADD PARTITION` or `ALTER TABLE DROP PARTITION` could result in inconsistent data, or cause the server to crash, if done concurrently with other accesses to the table. (Bug #28477, Bug #28488)
- Some valid identifiers were not parsed correctly. (Bug #28127)
- `PURGE MASTER LOGS BEFORE (subquery)` caused a server crash. Subqueries are forbidden in the `BEFORE` clause now. (Bug #28553)
- The server deducted some bytes from the `key_cache_block_size` [485] option value and reduced it to the next lower 512 byte boundary. The resulting block size was not a power of two. Setting the `key_cache_block_size` [485] system variable to a value that is not a power of two resulted in `MyISAM` table corruption. (Bug #23068, Bug #28478, Bug #25853)
- Embedded `/* ... */` comments were handled incorrectly within the definitions of stored programs and views, resulting in malformed definitions (the trailing `*/` was stripped). This also affected binary log contents. (Bug #25411, Bug #26302)
- Sending debugging information from a dump of the Event Scheduler to `COM_DEBUG` could cause the server to crash. (Bug #28075)
- The query `SELECT /*2*/ user, host, db, info FROM INFORMATION_SCHEMA.PROCESSLIST WHERE (command!='Daemon' || user='event_scheduler') AND (info IS NULL OR info NOT LIKE '%processlist %') ORDER BY INFO` yielded inconsistent results. (Bug #26338)
- Binary content `0x00` in a `BLOB` column sometimes became `0x5C 0x00` following a dump and reload, which could cause problems with data using multi-byte character sets such as `GBK` (Chinese). This was due to a problem with `SELECT INTO OUTFILE` whereby `LOAD DATA` later incorrectly interpreted `0x5C` as the second byte of a multi-byte sequence rather than as the `SOLIDUS` (“\”) character, used by MySQL as the escape character. (Bug #26711)
- The `PARTITION_COMMENT` column of the `INFORMATION_SCHEMA.PARTITIONS` table had the wrong default value. (Bug #28007)
- Killing from one connection a long-running `EXPLAIN QUERY` started from another connection caused `mysqld` to crash. (Bug #28598)
- Forcing the use of an index on a `SELECT` query when the index had been disabled would raise an error without running the query. The query now executes, with a warning generated noting that the use of a disabled index has been ignored. (Bug #28476)
- An error occurred trying to connect to `mysqld-debug.exe`. (Bug #27597)
- Conversion errors could occur when constructing the condition for an `IN` predicate. The predicate was treated as if the affected column contains `NULL`, but if the `IN` predicate is inside `NOT`, incorrect results could be returned. (Bug #22855)
- A stack overrun could occur when storing `DATETIME` values using repeated prepared statements. (Bug #27592)
- For attempts to open a nonexistent table, the server should report `ER_NO_SUCH_TABLE` [3966] but sometimes reported `ER_TABLE_NOT_LOCKED` [3963]. (Bug #27907)
- A query that grouped by the result of an expression returned a different result when the expression was assigned to a user variable. (Bug #28494)
- For `CAST()` [1012] of a `NULL` value with type `DECIMAL`, the return value was incorrectly initialized, producing a runtime error for binaries built using Visual C++ 2005. (Bug #28250)

- Linux binaries were unable to dump core after executing a `setuid()` call. (Bug #21723)
- `ALTER TABLE ... ENABLE KEYS` could cause `mysqld` to crash when executed on a table containing on a `MyISAM` table containing billions of rows. (Bug #27029)
- When one thread attempts to lock two (or more) tables and another thread executes a statement that aborts these locks (such as `REPAIR TABLE`, `OPTIMIZE TABLE`, or `CHECK TABLE`), the thread might get a table object with an incorrect lock type in the table cache. The result is table corruption or a server crash. (Bug #28574)
- `mysqldump` calculated the required memory for a hex-blob string incorrectly causing a buffer overrun. This in turn caused `mysqldump` to crash silently and produce incomplete output. (Bug #28522)
- For debug builds, `ALTER TABLE` could trigger an assertion failure due to occurrence of a deadlock when committing changes. (Bug #28652)
- The embedded server library displayed error messages at startup if the `mysql.plugin` table was not present. This no longer occurs. (Bug #25800)
- Setting an interval of `EVERY 0 SECOND` for a scheduled event caused the server to crash. (Bug #28666)
- `SHOW ENGINES` and queries on `INFORMATION_SCHEMA.ENGINES` did not use the same values for representing the same storage engine states. (Bug #27684)
- A too-long `shared-memory-base-name` value could cause a buffer overflow and crash the server or clients. (Bug #24924)
- An update on a multiple-table view with the `CHECK OPTION` clause and a subquery in the `WHERE` condition could cause an assertion failure. (Bug #28561)
- The `Bytes_received` [559] and `Bytes_sent` [559] status variables could hold only 32-bit values (not 64-bit values) on some platforms. (Bug #28149)
- When using a `MEMORY` table on Mac OS X, dropping a table and than creating a table with the same name could cause the information of the deleted table to remain accessible, leading to index errors. (Bug #28309)
- On some systems, `udf_example.c` returned an incorrect result length. Also on some systems, `mysql-test-run.pl` could not find the shared object built from `udf_example.c`. (Bug #27741)
- Attempting to create an index on a `BIT` column failed after modifying the column. (Bug #28631)
- Due to a race condition, executing `FLUSH PRIVILEGES` in one thread could cause brief table unavailability in other threads. (Bug #24988)
- The modification of a table by a partially completed multi-column update was not recorded in the binlog, rather than being marked by an event and a corresponding error code. (Bug #27716)
- Conversion of U+00A5 YEN SIGN and U+203E OVERLINE from `ucs2` to `ujis` produced incorrect results. (Bug #28600)
- Outer join queries with `ON` conditions over constant outer tables did not return `NULL`-complemented rows when conditions were evaluated to `FALSE`. (Bug #28571)
- Calling the `UpdateXML()` [1018] function using invalid XPath syntax caused memory corruption possibly leading to a crash of the server. (Bug #28558)
- Using `ALTER TABLE` to move columns resulted only in the columns being renamed. The table contents were not changed. (Bug #28427)
- Storing a large number into a `FLOAT` or `DOUBLE` column with a fixed length could result in incorrect truncation of the number if the column's length was greater than 31. (Bug #28121)

- Stack overflow caused server crashes. (Bug #21476)
- `SHOW GLOBAL VARIABLES` repeated some variable names. (Bug #28580)
- A number of `SHOW` statements caused `mysqld` to crash on recent versions of Solaris. This issue is believed to be present only in MySQL 5.1.12 and later. (Bug #23810)
- Following an invalid call to `UpdateXML()` [1018], calling the function again (even if valid) crashed the server. (Bug #27898)
- `DECIMAL` values beginning with nine `9` digits could be incorrectly rounded. (Bug #27984)
- Subselects returning `LONG` values in MySQL versions later than 5.0.24a returned `LONGLONG` prior to this. The previous behavior was restored. (Bug #28492)

  References: This bug was introduced by Bug #19714.
- Statements within triggers ignored the value of the `low_priority_updates` [491] system variable. (Bug #26162)

  References: See also Bug #29963.
- Attempting to `LOAD_FILE` from an empty floppy drive under Windows, caused the server to hang. For example, if you opened a connection to the server and then issued the command `SELECT LOAD_FILE('a:test');`, with no floppy in the drive, the server was inaccessible until the modal pop-up dialog box was dismissed. (Bug #28366)
- `HASH` indexes on `VARCHAR` columns with binary collations did not ignore trailing spaces from strings before comparisons. This could result in duplicate records being successfully inserted into a `MEMORY` table with unique key constraints. A consequence was that internal `MEMORY` tables used for `GROUP BY` calculation contained duplicate rows that resulted in duplicate-key errors when converting those temporary tables to `MyISAM`, and that error was incorrectly reported as a `table is full` error. (Bug #27643)
- `mysqltest` used a too-large stack size on PowerPC/Debian Linux, causing thread-creation failure for tests that use many threads. (Bug #28333)
- Passing a `DECIMAL` value as a parameter of a statement prepared with `PREPARE` resulted in an error. (Bug #28509)
- The server made strong assumptions about the structure of the `general_log` [477] and `slow_log` log tables: It supported only the table structure defined in the `mysql` database creation scripts. The server also permitted limited `ALTER TABLE` operations on the log tables, but adding an `AUTO_INCREMENT` column did not properly initialize the column, and subsequent inserts into the table could fail to generate correct sequence numbers. Now an `ALTER TABLE` statement that adds an `AUTO_INCREMENT` column populates the column correctly. In addition, when the server writes a log table row, it will set columns not present in the original table structure to their default values. (Bug #27857)
- When the query cache was fully used, issuing `RENAME DATABASE` or `RENAME SCHEMA` could cause the server to hang, with 100% CPU usage. (Bug #28211)
- If a stored function or trigger was killed, it aborted but no error was thrown, permitting the calling statement to continue without noticing the problem. This could lead to incorrect results. (Bug #27563)
- A stored program that uses a variable name containing multi-byte characters could fail to execute. (Bug #27876)
- In `SHOW SLAVE STATUS` output, `Last_Errno` and `Last_Error` were not set after `master_retry_count` errors had occurred. To provide additional information, the statement now displays four additional columns:
  - `Last_IO_Errno`: The number of the last error that caused the I/O thread to stop

  - `Last_IO_Error`: A description of the last error that caused the I/O thread to stop
  - `Last_SQL_Errno`: The number of the last error that caused the SQL thread to stop
  - `Last_SQL_Error`: A description of the last error that caused the SQL thread to stop

  Also, `Last_Errno` and `Last_Error` now are aliases for `Last_SQL_Errno` and `Last_SQL_Error`. (Bug #24954)

- On some Linux distributions where LinuxThreads and NPTL `glibc` versions both are available, statically built binaries can crash because the linker defaults to LinuxThreads when linking statically, but calls to external libraries (such as `libnss`) are resolved to NPTL versions. This cannot be worked around in the code, so instead if a crash occurs on such a binary/OS combination, print an error message that provides advice about how to fix the problem. (Bug #24611)
- The server crashed when attempting to open a table having a `#mysql50#` prefix in the database or table name. The server now will not open such tables. (This prefix is reserved by `mysql_upgrade` for accessing 5.0 tables that have names not yet encoded for 5.1.) (Bug #26402)
- A server crash could happen under rare conditions such that a temporary table outgrew heap memory reserved for it and the remaining disk space was not big enough to store the table as a `MyISAM` table. (Bug #28449)
- On Windows, an application that called `mysql_thread_init()` but forgot to call `mysql_thread_end()` would get this error: `Error in my_thread_global_end()`. (Bug #25621)
- The `IS_UPDATABLE` column in the `INFORMATION_SCHEMA.VIEWS` table was not always set correctly. (Bug #28266)
- `ON` conditions from `JOIN` expressions were ignored when checking the `CHECK OPTION` clause while updating a multiple-table view that included such a clause. (Bug #27827)
- When upgrading from MySQL 5.1.17 to 5.1.18, `mysql_upgrade` and `mysql_fix_privilege_tables` did not upgrade the system tables relating to the Event Scheduler correctly. (Bug #28521)
- The test case for `mysqldump` failed with `bin-log` disabled. (Bug #28372)
- For a given user variable `@v`, the statements `SELECT @v` and `CREATE TABLE ... AS SELECT @v` did not return the same data type. (Bug #26277)
- `mysql_affected_rows()` could return an incorrect result for `INSERT ... ON DUPLICATE KEY UPDATE` if the `CLIENT_FOUND_ROWS` flag was set. (Bug #28505)
- When `mysqld` was run as a Windows service, shared memory objects were not created in the global namespace and could not be used by clients to connect. (Bug #24731)
- The `check-cpu` script failed to detect AMD64 Turion processors correctly. (Bug #17707)
- Granting access privileges to an individual table where the database or table name contained an underscore would fail. (Bug #18660)
- The `-lmtmalloc` library was removed from the output of `mysql_config` on Solaris, as it caused problems when building `DBD::mysql` (and possibly other applications) on that platform that tried to use `dlopen()` to access the client library. (Bug #18322)
- When using `mysqlbinlog` with `--read-from-remote-server` to load the data direct from a remote MySQL server would cause a core dump when dumping certain binary log events. (Bug #17654)
- The server was ignoring the return value of the `parse()` function for full-text parser plugins. (Bug #18839)

- The omission of leading zeros in dates could lead to erroneous results when these were compared with the output of certain date and time functions. (Bug #16377)
- Trying to shut down the server following a failed `LOAD DATA INFILE` caused `mysqld` to crash. (Bug #17233)
- The internal functions for table preparation, creation, and alteration were not re-execution friendly, causing problems in code that: repeatedly altered a table; repeatedly created and dropped a table; opened and closed a cursor on a table, altered the table, and then reopened the cursor; used `ALTER TABLE` to change a table's current `AUTO_INCREMENT` value; created indexes on `utf8` columns.

  Re-execution of `CREATE DATABASE`, `CREATE TABLE`, and `ALTER TABLE` statements in stored routines or as prepared statements also caused incorrect results or crashes. (Bug #4968, Bug #6895, Bug #19182, Bug #19733, Bug #22060, Bug #24879)
- The result for `CAST()` [1012] when casting a value to `UNSIGNED` was limited to the maximum signed `BIGINT` value (9223372036854775808), rather than the maximum unsigned value (18446744073709551615). (Bug #8663)
- Using up-arrow for command-line recall in `mysql` could cause a segmentation fault. (Bug #10218)

Changes in MySQL 5.1.19 (2007-05-25)

This is a new Beta development release, fixing recently discovered bugs.

Note

This Beta release, as any other pre-production release, should not be installed on *production* level systems or systems with critical data. It is good practice to back up your data before installing any new version of software. Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at http://bugs.mysql.com/ for more details about the individual bugs fixed in this version.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details, please see http://www.mysql.com/products/enterprise.

Functionality Added or Changed

- **Incompatible Change**: `INSERT DELAYED` is now downgraded to a normal `INSERT` if the statement uses functions that access tables or triggers, or that is called from a function or a trigger.

  This was done to resolve the following interrelated issues:

  - The server could abort or deadlock for `INSERT DELAYED` statements for which another insert was performed implicitly (for example, using a stored function that inserted a row).
  - A trigger using an `INSERT DELAYED` caused the error `INSERT DELAYED can't be used with table ... because it is locked with LOCK TABLES` although the target table was not actually locked.
  - `INSERT DELAYED` into a table with a `BEFORE INSERT` or `AFTER INSERT` trigger gave an incorrect `NEW` pseudocolumn value and caused the server to deadlock or abort.

  (Bug #21483)

  References: See also Bug #20497, Bug #21714.

- **MySQL Cluster**: Formerly, restoring a cluster backup made on a MySQL 5.0 Cluster to a 5.1 cluster using a 5.1 version of `ndb_restore` did not resize `VARCHAR` columns as might be expected; now, the default behavior of `ndb_restore` in such cases is to resize the `VARCHAR` columns. This changed default behavior can be overridden using the `--no-upgrade` (or `-u`) option when invoking `ndb_restore`. (Bug #22240)
- A new status variable, `Com_call_procedure`, indicates the number of calls to stored procedures. (Bug #27994)
- The `BLACKHOLE` storage engine now supports `INSERT DELAYED`. Previously, `INSERT DELAYED` statements for `BLACKHOLE` tables were not supported, and caused the server to crash. (Bug #27998)
- The `BLACKHOLE` storage engine now supports `LOCK TABLES` and `UNLOCK TABLES`. (Bug #26241)
- `SESSION_STATUS`
- The data type used for the `VARIABLE_VALUE` column of the following `INFORMATION_SCHEMA` tables has been changed to `VARCHAR`:
  - `GLOBAL_STATUS`
  - `SESSION_STATUS`

Bugs Fixed

- **Security Fix**: UDFs are supposed to be loadable only from the plugin directory, but this restriction was not being enforced. (Bug #28341)
- **Security Fix**: Use of a view could enable a user to gain update privileges for tables in other databases. (Bug #27878, CVE-2007-3782)
- **MySQL Cluster**: DDL operations were not supported on a partially started cluster. (Bug #24631)
- **MySQL Cluster**: Multiple operations involving deletes followed by reads were not handled correctly.

  Note

  This issue could also affect MySQL Cluster Replication.

  (Bug #28276)
- **MySQL Cluster**: Local checkpoint files relating to dropped `NDB` tables were not removed. (Bug #28348)
- **MySQL Cluster**: Restarting a data node caused SQL nodes to log repeatedly and unnecessarily the status of the event buffer, causing a memory leak of approximately 4 MB for each `mysqld` process each time this occurred.

  (This issue was known to occur in MySQL 5.1.16 and later only.) (Bug #27292)

- **MySQL Cluster**: A delay in obtaining `AUTO_INCREMENT` IDs could lead to excess temporary errors. (Bug #28410)
- **MySQL Cluster**: `ndb_connectstring` did not appear in the output of `SHOW VARIABLES`. (Bug #26675)
- **MySQL Cluster**: When an API node sent more than 1024 signals in a single batch, `NDB` would process only the first 1024 of these, and then hang. (Bug #28443)
- **MySQL Cluster**: A failure to release internal resources following an error could lead to problems with single user mode. (Bug #25818)
- **MySQL Cluster**: Repeated insertion of data generated by `mysqldump` into `NDB` tables could eventually lead to failure of the cluster. (Bug #27437)
- **MySQL Cluster**: `ndb_mgmd` failed silently when the cluster configuration file contained invalid `[tcp]` entries. (Bug #27207)
- **Disk Data**: Extremely large inserts into Disk Data tables could lead to data node failure in some circumstances. (Bug #27942)
- **Cluster API**: In a multi-operation transaction, a delete operation followed by the insertion of an implicit `NULL` failed to overwrite an existing value. (Bug #20535)
- The error message for error number `137` did not report which database/table combination reported the problem. (Bug #27173)
- `LOAD DATA` did not use `CURRENT_TIMESTAMP` as the default value for a `TIMESTAMP` column for which no value was provided. (Bug #27670)
- Comparison of the string value of a date showed as unequal to `CURTIME()` [982]. Similar behavior was exhibited for `DATETIME` values. (Bug #28208)
- Portability problems caused by use of `isinf()` were corrected. (Bug #28240)
- A query with a `NOT IN` subquery predicate could cause a crash when the left operand of the predicate evaluated to `NULL`. (Bug #28375)
- `CAST()` [1012] to `DECIMAL` did not check for overflow. (Bug #27957)
- A statement of the form `CREATE TABLE IF NOT EXISTS t1 SELECT f1() AS i` failed with a deadlock error if the stored function `f1()` referred to a table with the same name as the to-be-created table. Now it correctly produces a message that the table already exists. (Bug #22427)
- Some test suite files were missing from some MySQL-test packages. (Bug #26609)
- Views ignored precision for `CAST()` [1012] operations. (Bug #27921)
- `mysql_upgrade` failed if certain SQL modes were set. Now it sets the mode itself to avoid this problem. (Bug #28401)
- For `InnoDB`, in some rare cases the optimizer preferred a more expensive `ref` [697] access to a less expensive range access. (Bug #28189)
- The second execution of a prepared statement from a `UNION` query with `ORDER BY RAND()` caused the server to crash. This problem could also occur when invoking a stored procedure containing such a query. (Bug #27937)
- Grouping queries with correlated subqueries in `WHERE` conditions could produce incorrect results. (Bug #28337)
- `CREATE TABLE IF NOT EXISTS ... SELECT` caused a server crash if the target table already existed and had a `BEFORE INSERT` trigger. (Bug #20903)
- Quoted labels in stored routines were mishandled, rendering the routines unusable. (Bug #21513)

- A buffer overflow could occur when using `DECIMAL` columns on Windows operating systems. (Bug #28361)
- Deadlock occurred for attempts to execute `CREATE TABLE IF NOT EXISTS ... SELECT` when `LOCK TABLES` had been used to acquire a read lock on the target table. (Bug #20662, Bug #15522)
- Flow control optimization in stored routines could cause exception handlers to never return or execute incorrect logic. (Bug #26977)
- `EXPLAIN` for a query on an empty table immediately after its creation could result in a server crash. (Bug #28272)
- Running `CHECK TABLE` concurrently with a `SELECT`, `INSERT` or other statement on Windows could corrupt a MyISAM table. (Bug #25712)
- Selecting `MIN()` [1047] on an indexed column that contained only `NULL` values caused `NULL` to be returned for other result columns. (Bug #27573)
- Changes to some system variables should invalidate statements in the query cache, but invalidation did not happen. (Bug #27792)
- Some `ALTER TABLE` statements that worked in MySQL 5.0 did not work in 5.1. (Bug #28415)
- `CURDATE()` [982] is less than `NOW()` [990], either when comparing `CURDATE()` [982] directly (`CURDATE() < NOW()` is true) or when casting `CURDATE()` [982] to `DATE` (`CAST(CURDATE() AS DATE) < NOW()` is true). However, storing `CURDATE()` [982] in a `DATE` column and comparing *`col_name`* `< NOW()` incorrectly yielded false. This is fixed by comparing a `DATE` column as `DATETIME` for comparisons to a `DATETIME` constant. (Bug #21103)
- A large filesort could result in a division by zero error and a server crash. (Bug #27119)
- Comparing a `DATETIME` column value with a user variable yielded incorrect results. (Bug #28261)
- Concurrent execution of `CREATE TABLE ... SELECT` and other statements involving the target table suffered from various race conditions, some of which might have led to deadlocks. (Bug #24738)
- An attempt to execute `CREATE TABLE ... SELECT` when a temporary table with the same name already existed led to the insertion of data into the temporary table and creation of an empty nontemporary table. (Bug #24508)
- Some `InnoDB` variables were missing from the output of `mysqld --verbose --help`. (Bug #26987)
- The server could hang for `INSERT IGNORE ... ON DUPLICATE KEY UPDATE` if an update failed. (Bug #28000)
- Comparisons of `DATE` or `DATETIME` values for the `IN()` [942] function could yield incorrect results. (Bug #28133)
- When dumping procedures, `mysqldump --compact` [294] generated output that restored the session variable `sql_mode` [526] without first capturing it. When dumping routines, `mysqldump --compact` [294] neither set nor retrieved the value of `sql_mode` [526]. (Bug #28223)
- It was not possible to use the value `-9223372036854775808` (that is, `-MAXVALUE + 1`) when specifying a `LIST` partition. (Bug #28005)
- `libmysql.dll` could not be dynamically loaded on Windows. (Bug #28358)
- Using a `TEXT` local variable in a stored routine in an expression such as `SET` *`var`* `= SUBSTRING(`*`var`*`, 3)` produced an incorrect result. (Bug #27415)
- Changing the size of a key buffer that is under heavy use could cause a server crash. The fix partially removes the limitation that `LOAD INDEX INTO CACHE` fails unless all indexes in a table

have the same block size. Now the statement fails only if `IGNORE LEAVES` is specified. (Bug #17332)

- For dates with 4-digit year parts less than 200, an incorrect implicit conversion to add a century was applied for date arithmetic performed with `DATE_ADD()` [983], `DATE_SUB()` [986], `+ INTERVAL`, and `- INTERVAL`. (For example, `DATE_ADD('0050-01-01 00:00:00', INTERVAL 0 SECOND)` [983] became `'2050-01-01 00:00:00'`.) (Bug #18997)

Changes in MySQL 5.1.18 (2007-05-08)

This is a new Beta development release, fixing recently discovered bugs.

Note

This Beta release, as any other pre-production release, should not be installed on *production* level systems or systems with critical data. It is good practice to back up your data before installing any new version of software. Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at http://bugs.mysql.com/ for more details about the individual bugs fixed in this version.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details, please see http://www.mysql.com/products/enterprise.

Functionality Added or Changed

- **Incompatible Change**: **MySQL Cluster**: The internal specifications for columns in `NDB` tables has changed to enable compatibility with future MySQL Cluster releases that are expected to permit online adding and dropping of columns. This change is not backward compatible with earlier versions of MySQL Cluster.

  See Internal column specification changes, for important information prior to upgrading a MySQL Cluster to MySQL 5.1.18 or later from MySQL 5.1.17 or earlier.

  References: See also Bug #28205.

- **Incompatible Change**: **Replication**: The `INFORMATION_SCHEMA.EVENTS` and `mysql.event` tables have been changed to facilitate replication of events. When upgrading to MySQL 5.1.18, you must run `mysql_upgrade` prior to working with events. Until you have done so, any statement relating to the Event Scheduler or these tables (including `SHOW EVENTS`) will fail with the errors `Expected field status at position 12 to have type enum ('ENABLED','SLAVESIDE_DISABLED','DISABLED'), found enum('ENABLED','DISABLED')` and `Table mysql.event is damaged. Can not open`.

  These changes were made as part of fixes for the following bugs:

  - The effects of scheduled events were not replicated (that is, binary logging of scheduled events did not work).
  - Effects of scheduled events on a replication master were both replicated and executed on the slave, causing double execution of events.
  - `CREATE FUNCTION` statements and their effects were not replicated correctly.

  For more information, see Replication of Invoked Features. (Bug #17857, Bug #16421, Bug #20384, Bug #17671)

- **Cluster Replication**: **Incompatible Change**: The definition of the `mysql.ndb_apply_status` table has changed such that an online upgrade is not possible from MySQL 5.1.17 or earlier for a

replication slave cluster; you must shut down all SQL nodes as part of the upgrade procedure. See Upgrading and Downgrading MySQL Cluster, before upgrading.

For more information about the changes to `mysql.ndb_apply_status` see MySQL Cluster Replication Schema and Tables.

- **Incompatible Change**: Prior to this release, when `DATE` values were compared with `DATETIME` values, the time portion of the `DATETIME` value was ignored, or the comparison could be performed as a string compare. Now a `DATE` value is coerced to the `DATETIME` type by adding the time portion as `00:00:00`. To mimic the old behavior, use the `CAST()` [1012] function as shown in this example: `SELECT date_col = CAST(NOW() AS DATE) FROM table;`. (Bug #28929)

- **Incompatible Change**: The plugin interface and its handling of system variables was changed. Command-line options such as `--skip-innodb` [1359] now cause an error if `InnoDB` is not built-in or plugin-loaded. You should use `--loose-skip-innodb` if you do not want any error even if `InnoDB` is not available. The `--loose` prefix modifier should be used for all command-line options where you are uncertain whether the plugin exists and when you want the operation to proceed even if the option is necessarily ignored due to the absence of the plugin. (For a description of how `--loose` works, see Using Options on the Command Line.)

- **Important Change**: When upgrading to MySQL 5.1.18 or later from a previous MySQL version and scheduled events have been used, the upgrade utilities do not accommodate changes in event-related system tables. As a workaround, you can dump events before the upgrade, then restore them from the dump afterward. This issue was fixed in MySQL 5.1.20.

  References: See also Bug #28521.

- **MySQL Cluster**: The following changes were made in the `ndb_size.pl` utility:

  - When `ndb_size.pl` calculates a value for a given configuration parameter that is less than the default value, it now suggests the default value instead.

  - The dependency on `HTML::Template` was removed, with the result that the file `ndb_size.tmpl` is no longer needed or included.

  (Bug #24227, Bug #24228)

- **MySQL Cluster**: The behavior of the `ndb_restore` utility has been changed as follows:

  - It is now possible to restore selected databases or tables using `ndb_restore`.

  - Several options have been added for use with `ndb_restore --print_data` [1997] to facilitate the creation of structured data dump files. These options can be used to make dumps made using `ndb_restore` more like those produced by `mysqldump`.

  For details of these changes, see `ndb_restore` — Restore a MySQL Cluster Backup. (Bug #26899, Bug #26900)

- **Cluster Replication**: **Replication**: Some circular replication setups are now supported for MySQL Cluster. See Known Issues in MySQL Cluster Replication, for detailed information. (Bug #17095, Bug #25688)

- **Cluster API**: The MGM API now supports explicit setting of network timeouts using the `ndb_mgm_set_timeout()` function. A utility function `ndb_mgm_number_of_mgmd_in_connect_string()` is also implemented to facilitate calculation of timeouts based on the number of management servers in the cluster.

- If a set function *`S`* with an outer reference *`S(outer_ref)`* cannot be aggregated in the outer query against which the outer reference has been resolved, MySQL interprets *`S(outer_ref)`* the same way that it would interpret *`S(const)`*. However, standard SQL requires throwing an error in this situation. An error now is thrown for such queries if the `ANSI` [577] SQL mode is enabled. (Bug #27348)

- The output of `mysql --xml` [266] and `mysqldump --xml` [302] now includes a valid XML namespace. (Bug #25946)
- If you use SSL for a client connection, you can tell the client not to authenticate the server certificate by specifying neither `--ssl-ca` [657] nor `--ssl-capath` [658]. The server still verifies the client according to any applicable requirements established using `GRANT` statements for the client, and it still uses any `--ssl-ca` [657]/`--ssl-capath` [658] values that were passed to server at startup time. (Bug #25309)
- Several additional data types are supported for columns in `INFORMATION_SCHEMA` tables: `DATE`, `TIME`, `BLOB`, `FLOAT`, and all integer types. (Bug #27047)
- `mysqld_multi` now understands the `--no-defaults` [246], `--defaults-file` [246], and `--defaults-extra-file` [246] options. The `--config-file` [246] option is deprecated; if given, it is treated like `--defaults-extra-file` [246]. (Bug #27390)
- Added a `MASTER_SSL_VERIFY_SERVER_CERT` option for the `CHANGE MASTER TO` statement, and a `Master_SSL_Verify_Server_Cert` output column to the `SHOW SLAVE STATUS` statement. The option value also is written to the `master.info` file. (Bug #19991)
- Renamed the `old_mode` system variable to `old` [507].
- The `mysql_create_system_tables` script was removed because `mysql_install_db` no longer uses it in MySQL 5.1.
- Storage engine plugins may now be uninstalled at run time. However, a plugin is not actually uninstalled until after its reference count drops to zero. The `default_storage_engine` system variable consumes a reference count, so uninstalling will not complete until said reference is removed.
- New command-line options: To alleviate ambiguities in variable names, all variables related to plugins can be specified using a `plugin` part in the name. For example, every time where we used to have `innodb` in the command-line options, you can now write `plugin-innodb`:

  ```
  --skip-plugin-innodb
  --plugin-innodb-buffer-pool-size=#
  ```

  Furthermore, this is the preferred syntax. It helps to avoid ambiguities when a plugin, say, `wait`, has an option called `timeout`. `--wait-timeout` will still set a system variable, but `--plugin-wait-timeout` will set the plugin variable. Also, there is a new command-line option `--plugin-load` [439] to install or load plugins at initialization time without using the `mysql.plugin` table.
- Added `--write-binlog` [288] option for `mysqlcheck`. This option is enabled by default, but can be given as `--skip-write-binlog` [288] to cause `ANALYZE TABLE`, `OPTIMIZE TABLE`, and `REPAIR TABLE` statements generated by `mysqlcheck` not to be written to the binary log. (Bug #26262)
- Added the `--auto-generate-sql-add-autoincrement` [316], `--auto-generate-sql-execute-number` [316], `--auto-generate-sql-guid-primary` [316], `--auto-generate-sql-secondary-indexes` [317], `--auto-generate-sql-unique-query-number` [317], `--auto-generate-sql-unique-write-number` [317], `--post-query` [319], and `--pre-query` [319], options for `mysqlslap`. Removed the `--lock-directory` [318], `--slave` [319], and `--use-threads` [320] options.
- The `innodb_log_archive` [1375] system variable has been removed. The impact of this change should be low because the variable was unused, anyway.

Bugs Fixed

- **Security Fix**: A user with only the `ALTER` [626] privilege on a partitioned table could obtain information about the table that should require the `SELECT` [627] privilege. (Bug #23675, CVE-2007-2693)

- **Security Fix**: The requirement of the `DROP` [626] privilege for `RENAME TABLE` was not enforced. (Bug #27515, CVE-2007-2691)
- **Security Fix**: If a stored routine was declared using `SQL SECURITY INVOKER`, a user who invoked the routine could gain privileges. (Bug #27337, CVE-2007-2692)
- **MySQL Cluster**: **Replication**: (Replication): An `UPDATE` on the master became a `DELETE` on slaves. (Bug #27378)
- **MySQL Cluster**: An `INSERT` followed by a delete `DELETE` on the same `NDB` table caused a memory leak. (Bug #27756)

  References: This bug was introduced by Bug #20612.
- **MySQL Cluster**: `NDB` tables with indexes whose names contained space characters were not restored correctly by `ndb_restore` (the index names were truncated). (Bug #27758)
- **MySQL Cluster**: On Solaris, the value of an `NDB` table column declared as `BIT(33)` was always displayed as `0`. (Bug #26986)
- **MySQL Cluster**: A data node failing while another data node was restarting could leave the cluster in an inconsistent state. In certain rare cases, this could lead to a race condition and the eventual forced shutdown of the cluster. (Bug #27466)
- **MySQL Cluster**: Using more than 16GB for `DataMemory` [1817] caused problems with variable-size columns. (Bug #27512)
- **MySQL Cluster**: The cluster waited 30 seconds instead of 30 milliseconds before reading table statistics. (Bug #28093)
- **MySQL Cluster**: Joins on multiple tables containing `BLOB` columns could cause data nodes run out of memory, and to crash with the error `NdbObjectIdMap::expand unable to expand`. (Bug #26176)
- **MySQL Cluster**: The name of the month “March” was given incorrectly in the cluster error log. (Bug #27926)
- **MySQL Cluster**: Under some circumstances, a node restart could fail to update the Global Checkpoint Index (GCI). (Bug #28023)
- **MySQL Cluster**: Error messages displayed when running in single user mode were inconsistent. (Bug #27021)
- **MySQL Cluster**: `NDB` tables having `MEDIUMINT AUTO_INCREMENT` columns were not restored correctly by `ndb_restore`, causing spurious duplicate key errors. This issue did not affect `TINYINT`, `INT`, or `BIGINT` columns with `AUTO_INCREMENT`. (Bug #27775)
- **MySQL Cluster**: Under certain rare circumstances, `ndbd` could get caught in an infinite loop when one transaction took a read lock and then a second transaction attempted to obtain a write lock on the same tuple in the lock queue. (Bug #28073)
- **MySQL Cluster**: In an `NDB` table having a `TIMESTAMP` column using `DEFAULT CURRENT_TIMESTAMP`, that column would assume a random value when another column in the same row was updated. (Bug #27127)
- **MySQL Cluster**: Under certain rare circumstances performing a `DROP TABLE` or `TRUNCATE TABLE` on an `NDB` table could cause a node failure or forced cluster shutdown. (Bug #27581)
- **MySQL Cluster**: In some cases, `AFTER UPDATE` and `AFTER DELETE` triggers on `NDB` tables that referenced subject table did not see the results of operation which caused invocation of the trigger, but rather saw the row as it was prior to the update or delete operation.

  This was most noticeable when an update operation used a subquery to obtain the rows to be updated. An example would be `UPDATE tbl1 SET col2 = val1 WHERE tbl1.col1 IN`

`(SELECT col3 FROM tbl2 WHERE c4 = val2)` where there was an `AFTER UPDATE` trigger on table `tbl1`. In such cases, the trigger would fail to execute.

The problem occurred because the actual update or delete operations were deferred to be able to perform them later as one batch. The fix for this bug solves the problem by disabling this optimization for a given update or delete if the table has an `AFTER` trigger defined for this operation. (Bug #26242)

- **MySQL Cluster**: Adding of indexes online failed for `NDB` tables having `BLOB` or `TEXT` columns. (Bug #25431)
- **MySQL Cluster**: `INSERT IGNORE` wrongly ignored `NULL` values in unique indexes. (Bug #27980)
- **MySQL Cluster**: It was not possible to add a unique index to an `NDB` table while in single user mode. (Bug #27710)
- **MySQL Cluster**: When a cluster data node suffered a “hard” failure (such as a power failure or loss of a network connection) TCP sockets to the missing node were maintained indefinitely. Now socket-based transporters check for a response and terminate the socket if there is no activity on the socket after 2 hours. (Bug #24793)
- **MySQL Cluster**: Memory usage of a `mysqld` process grew even while idle. (Bug #27560)
- **MySQL Cluster**: The `NDBCLUSTER` table handler did not set bits in null bytes correctly. (Bug #26591)
- **MySQL Cluster**: When using the `MemReportFrequency` [1849] configuration parameter to generate periodic reports of memory usage in the cluster log, `DataMemory` [1817] usage was not always reported for all data nodes. (Bug #27444)
- **MySQL Cluster**: While a data node was stopped, dropping a table then creating an index on a different table caused that node to fail during restart. This was due to the re-use of the dropped table's internal ID for the index without verifying that the index now referred to a different database object. (Bug #21755)
- **MySQL Cluster**: When trying to create an `NDB` table after the server was started with `--ndbcluster` [1915] but without `--ndb-connectstring`, `mysqld` produced a memory allocation error. (Bug #27359)
- **MySQL Cluster**: Performing a delete followed by an insert during a local checkpoint could cause a `Rowid already allocated` error. (Bug #27205)
- **MySQL Cluster**: Performing `ALTER TABLE ... ENGINE=MERGE` on an `NDB` table caused `mysqld` to crash. (Bug #26898)
- **MySQL Cluster**: The `ndb_resize.pl` utility did not calculate memory usage for indexes correctly. (Bug #24229)
- **MySQL Cluster**: `START BACKUP NOWAIT` caused a spurious `Out of backup record` error in the management client (`START BACKUP` and `START BACKUP WAIT STARTED` performed normally). (Bug #25446)
- **MySQL Cluster**: When trying to create tables on an SQL node not connected to the cluster, a misleading error message `Table 'tbl_name' already exists` was generated. The error now generated is `Could not connect to storage engine`. (Bug #11217, Bug #18676)
- **Cluster Replication**: **Replication**: An SQL node acting as a replication master server could be a single point of failure; that is, if it failed, the replication slave had no way of knowing this, which could result in a mismatch of data between the master and the slave. (Bug #21494)
- **Replication**: When `RAND()` [975] was called multiple times inside a stored procedure, the server did not write the correct random seed values to the binary log, resulting in incorrect replication. (Bug #25543)

- **Replication**: Out-of-memory errors were not reported. Now they are written to the error log. (Bug #26844)
- **Replication**: Row-based replication of `MyISAM` to non-`MyISAM` tables did not work correctly for `BIT` columns. This has been corrected, but the fix introduces an incompatibility into the binary log format. (The incompatibility is corrected by the fix for Bug #27779.) (Bug #22583)
- **Replication**: If a rotate event occurred in the middle of a nontransaction group, the group position would be updated by the rotate event indicating an illegal group start position that was effectively inside a group. This can happen if, for example, a rotate occurs between an `Intvar` event and the associated `Query` event, or between the table map events and the rows events when using row-based replication. (Bug #23171)
- **Replication**: Improved out-of-memory detection when sending logs from a master server to slaves, and log a message when allocation fails. (Bug #26837)
- **Replication**: `GRANT` statements were not replicated if the server was started with the `--replicate-ignore-table` [1636] or `--replicate-wild-ignore-table` [1638] option. (Bug #25482)
- **Replication**: Restoration of the default database after stored routine or trigger execution on a slave could cause replication to stop if the database no longer existed. (Bug #25082)
- **Replication**: Aborting a statement on the master that applied to a nontransactional statement broke replication. The statement was written to the binary log but not completely executed on the master. Slaves receiving the statement executed it completely, resulting in loss of data synchrony. Now an error code is written to the error log so that the slaves stop without executing the aborted statement. (That is, replication stops, but synchrony to the point of the stop is preserved and you can investigate the problem.) (Bug #26551)
- **Cluster Replication**: **Disk Data**: An issue with replication of Disk Data tables could in some cases lead to node failure. (Bug #28161)
- **Disk Data**: When restarting a data node following the creation of a large number of Disk Data objects (approximately 200 such objects), the cluster could not assign a node ID to the restarting node. (Bug #25741)
- **Disk Data**: When in single user mode, it was possible to create log file groups and tablespaces from any SQL node connected to the cluster. (Bug #27712)
- **Disk Data**: `CREATE TABLE ... LIKE disk_data_table` created an in-memory `NDB` table. (Bug #25875)
- **Disk Data**: Creating an excessive number of Disk Data tables (1000 or more) could cause data nodes to fail. (Bug #24951)
- **Disk Data**: Changing a column specification or issuing a `TRUNCATE TABLE` statement on a Disk Data table caused the table to become an in-memory table.

  This fix supersedes an incomplete fix that was made for this issue in MySQL 5.1.15. (Bug #24667, Bug #25296)
- **Disk Data**: It was possible to drop the last remaining datafile in a tablespace using `ALTER TABLESPACE`, even when there was still an empty table using the tablespace.

  Note

  The datafile could be not dropped if the table still contained any rows, so this bug involved no loss of data.

  (Bug #21699)

- **Disk Data**: Changes to a Disk Data table made as part of a transaction could not be seen by the client performing the changes until the transaction had been committed. (Bug #27757)
- **Disk Data**: Setting the value of the `UNDO BUFFER SIZE` to 64K or less in a `CREATE LOGFILE GROUP` statement led to failure of cluster data nodes. (Bug #24560)
- **Disk Data**: Creating an excessive number of data files for a single tablespace caused data nodes to crash. (Bug #24521)
- **Cluster Replication**: Some queries that updated multiple tables were not backed up correctly. (Bug #27748)
- **Cluster Replication**: Under very high loads, checkpoints could be read or written with checkpoint indexes out of order. (Bug #27651)
- **Cluster Replication**: Trying to replicate a large number of frequent updates with a relatively small relay log (`max-relay-log-size` set to 1M or less) could cause the slave to crash. (Bug #27529)
- **Cluster Replication**: Setting `sql_log_bin` [525] to zero did not disable binary logging.

  This issue affected only the `NDB` storage engine. (Bug #27076)
- **Cluster Replication**: It was possible for API nodes to begin interacting with the cluster subscription manager before they were fully connected to the cluster. (Bug #27728)
- **Cluster API**: Using `NdbBlob::writeData()` to write data in the middle of an existing blob value (that is, updating the value) could overwrite some data past the end of the data to be changed. (Bug #27018)
- **Cluster API**: For `BLOB` reads on operations with lock mode `LM_CommittedRead`, the lock mode was not upgraded to `LM_Read` before the state of the `BLOB` had already been calculated. The `NDB` API methods affected by this problem included the following:

  - `NdbOperation::readTuple()`
  - `NdbScanOperation::readTuples()`
  - `NdbIndexScanOperation::readTuples()`

  (Bug #27320)
- `InnoDB`: The first read statement, if served from the query cache, was not consistent with the `READ COMMITTED` [1224] isolation level. (Bug #21409)
- The `CRC32()` [973] function returns an unsigned integer, but the metadata was signed, which could cause certain queries to return incorrect results. (For example, queries that selected a `CRC32()` [973] value and used that value in the `GROUP BY` clause.) (Bug #27530)
- Access through `my_pread()` or `my_pwrite()` to table files larger than 2GB could fail on some systems. (Bug #24566)
- On Windows, trying to use backslash (`\`) characters in paths for `DATA DIRECTORY` and `INDEX DIRECTORY` when creating partitioned tables caused MySQL to crash.

  (You must use `/` characters when specifying paths for these options, regardless of platform. See Overview of Partitioning in MySQL, for an example using absolute paths for `DATA DIRECTORY` and `INDEX DIRECTORY` when creating a partitioned table on Windows.) (Bug #26074, Bug #25141)
- A memory leak in the event scheduler was uncovered by Valgrind. (Bug #27733)
- `GROUP BY` on a `ucs2` column caused a server crash when there was at least one empty string in the column. (Bug #27079)

- A stored function invocation in the `WHERE` clause was treated as a constant. (Bug #27354)
- For storage engines that permit the current auto-increment value to be set, using `ALTER TABLE ... ENGINE` to convert a table from one such storage engine to another caused loss of the current value. (For storage engines that do not support setting the value, it cannot be retained anyway when changing the storage engine.) (Bug #25262)
- If the name of a table given to `myisamchk -rq` was a packed table and the name included the `.MYI` extension, `myisamchk` incorrectly created a file with a `.MYI.MYI` extension. (Bug #26782)
- Group relay log rotation updated only the log position and not the name, causing the slave to stop. (Bug #27583)
- `SELECT DISTINCT` could return incorrect results if the select list contained duplicated columns. (Bug #27659)
- The `MERGE` storage engine could return incorrect results when several index values that compare equality were present in an index (for example, `'gross'` and `'gross '`, which are considered equal but have different lengths). (Bug #24342)
- `mysql_upgrade` did not pass a password to `mysqlcheck` if one was given. (Bug #25452)
- `SHOW CREATE VIEW` qualified references to stored functions in the view definition with the function's database name, even when the database was the default database. This affected `mysqldump` (which uses `SHOW CREATE VIEW` to dump views) because the resulting dump file could not be used to reload the database into a different database. `SHOW CREATE VIEW` now suppresses the database name for references to stored functions in the default database. (Bug #23491)
- An error message suggested the use of `mysql_fix_privilege_tables` after an upgrade, but the recommended program is now `mysql_upgrade`. (Bug #27818)
- Duplicate entries were not assessed correctly in a `MEMORY` table with a `BTREE` primary key on a `utf8` `ENUM` column. (Bug #24985)
- With the `NO_AUTO_VALUE_ON_ZERO` [573] SQL mode enabled, `LAST_INSERT_ID()` [1036] could return 0 after `INSERT ... ON DUPLICATE KEY UPDATE`. Additionally, the next rows inserted (by the same `INSERT`, or the following `INSERT` with or without `ON DUPLICATE KEY UPDATE`), would insert 0 for the auto-generated value if the value for the `AUTO_INCREMENT` column was `NULL` or missing. (Bug #23233)
- `mysql_upgrade` did not detect failure of external commands that it runs. (Bug #26639)
- `SOUNDEX()` [956] returned an invalid string for international characters in multi-byte character sets. (Bug #22638)
- The `decimal.h` header file was incorrectly omitted from binary distributions. (Bug #27456)
- `OPTIMIZE TABLE` might fail on Windows when it attempts to rename a temporary file to the original name if the original file had been opened, resulting in loss of the `.MYD` file. (Bug #25521)
- A problem in handling of aggregate functions in subqueries caused predicates containing aggregate functions to be ignored during query execution. (Bug #24484)
- `mysqlbinlog` produced different output with the `-R` option than without it. (Bug #27171)
- Evaluation of an `IN()` predicate containing a decimal-valued argument caused a server crash. (Bug #27513, Bug #27362, CVE-2007-2583)
- Nongrouped columns were permitted by `*` in `ONLY_FULL_GROUP_BY` [575] SQL mode. (Bug #27874)
- Passing nested row expressions with different structures to an `IN` predicate caused a server crash. (Bug #27484)

- For queries that used `ORDER BY` with `InnoDB` tables, if the optimizer chose an index for accessing the table but found a covering index that enabled the `ORDER BY` to be skipped, no results were returned. (Bug #24778)
- For `MyISAM` tables, `COUNT(*)` [1045] could return an incorrect value if the `WHERE` clause compared an indexed `TEXT` column to the empty string (`''`). This happened if the column contained empty strings and also strings starting with control characters such as tab or newline. (Bug #26231)
- `mysql_install_db` could terminate with an error after failing to determine that a system table already existed. (Bug #27022)
- `MBROverlaps()` returned incorrect values in some cases. (Bug #24563)
- An `INTO OUTFILE` clause is permitted only for the final `SELECT` of a `UNION`, but this restriction was not being enforced correctly. (Bug #23345)
- In a view, a column that was defined using a `GEOMETRY` function was treated as having the `LONGBLOB` data type rather than the `GEOMETRY` type. (Bug #27300)
- The test for the `MYSQL_OPT_SSL_VERIFY_SERVER_CERT` option for `mysql_options()` was performed incorrectly. Also changed as a result of this bug fix: The `arg` option for the `mysql_options()` C API function was changed from `char *` to `void *`. (Bug #24121)
- A multiple-table `UPDATE` could return an incorrect rows-matched value if, during insertion of rows into a temporary table, the table had to be converted from a `MEMORY` table to a `MyISAM` table. (Bug #22364)
- Early `NULL`-filtering optimization did not work for `eq_ref` [697] table access. (Bug #27939)
- The temporary file-creation code was cleaned up on Windows to improve server stability. (Bug #26233)
- A slave that used `--master-ssl-cipher` [1631] could not connect to the master. (Bug #21611)
- The fix for Bug #17212 provided correct sort order for misordered output of certain queries, but caused significant overall query performance degradation. (Results were correct (good), but returned much more slowly (bad).) The fix also affected performance of queries for which results were correct. The performance degradation has been addressed. (Bug #27531)
- `mysql_stmt_fetch()` did an invalid memory deallocation when used with the embedded server. (Bug #25492)
- The XML output representing an empty result was an empty string rather than an empty `<resultset/>` element. (Bug #27608)
- Use of an aggregate function from an outer context as an argument to `GROUP_CONCAT()` [1046] caused a server crash. (Bug #27229)
- yaSSL crashed on pre-Pentium Intel CPUs. (Bug #21765)
- Performing a `UNION` on two views that had `ORDER BY` clauses resulted in an `Unknown column` error. (Bug #27786)
- `mysqldump` could not connect using SSL. (Bug #27669)
- Failure to allocate memory associated with `transaction_prealloc_size` [535] could cause a server crash. (Bug #27322)
- For `InnoDB` tables, a multiple-row `INSERT` of the form `INSERT INTO t (id...) VALUES (NULL...) ON DUPLICATE KEY UPDATE id=VALUES(id)`, where `id` is an `AUTO_INCREMENT` column, could cause `ERROR 1062 (23000): Duplicate entry...` errors or lost rows. (Bug #27650)

- Queries containing subqueries with `COUNT(*)` [1045] aggregated in an outer context returned incorrect results. This happened only if the subquery did not contain any references to outer columns. (Bug #27257)
- Row equalities in `WHERE` clauses could cause memory corruption. (Bug #27154)
- Some equi-joins containing a `WHERE` clause that included a `NOT IN` subquery caused a server crash. (Bug #27870)
- Using `CAST()` [1012] to convert `DATETIME` values to numeric values did not work. (Bug #23656)
- The values displayed for the `Innodb_row_lock_time` [565], `Innodb_row_lock_time_avg` [565], and `Innodb_row_lock_time_max` [565] status variables were incorrect. (Bug #23666)
- Some views could not be created even when the user had the requisite privileges. (Bug #24040)
- A damaged or missing `mysql.event` table caused `SHOW VARIABLES` to fail. (Bug #23631)
- The result set of a query that used `WITH ROLLUP` and `DISTINCT` could lack some rollup rows (rows with `NULL` values for grouping attributes) if the `GROUP BY` list contained constant expressions. (Bug #24856)
- The server did not shut down cleanly. (Bug #27310)
- Using `SET GLOBAL` to change the `lc_time_names` [487] system variable had no effect on new connections. (Bug #22648)
- `mysqldump` would not dump a view for which the `DEFINER` no longer exists. (Bug #26817)
- For `INSERT INTO ... SELECT` where index searches used column prefixes, insert errors could occur when key value type conversion was done. (Bug #26207)
- `mysqlbinlog --base64-output` produced invalid SQL. (Bug #26194)
- With `innodb_file_per_table` [1367] enabled, attempting to rename an `InnoDB` table to a nonexistent database caused the server to exit. (Bug #27381)
- In out-of-memory conditions, the server might crash or otherwise not report an error to the Windows event log. (Bug #27490)
- The `NO_DIR_IN_CREATE` [573] server SQL mode was not enforced for partitioned tables. (Bug #24633)
- `mysqldump` crashed if it got no data from `SHOW CREATE PROCEDURE` (for example, when trying to dump a routine defined by a different user and for which the current user had no privileges). Now it prints a comment to indicate the problem. It also returns an error, or continues if the `--force` option is given. (Bug #27293)
- Corrupted `MyISAM` tables that have different definitions in the `.frm` and `.MYI` tables might cause a server crash. (Bug #25908)
- Implicit conversion of `9912101` to `DATE` did not match `CAST(9912101 AS DATE)` [1012]. (Bug #23093)
- For `FEDERATED` tables, `SHOW CREATE TABLE` could fail when the table name was longer than the connection name. (Bug #27036)
- Debug builds on Windows generated false alarms about uninitialized variables with some Visual Studio runtime libraries. (Bug #27811)
- Incorrect results could be returned for some queries that contained a select list expression with `IN` or `BETWEEN` [941] together with an `ORDER BY` or `GROUP BY` on the same expression using `NOT IN` or `NOT BETWEEN`. (Bug #27532)

- Setting a column to `NOT NULL` with an `ON DELETE SET NULL` clause foreign key crashes the server. (Bug #25927)
- Index hints (`USE INDEX`, `IGNORE INDEX`, `FORCE INDEX`) cannot be used with `FULLTEXT` indexes, but were not being ignored. (Bug #25951)
- The `FEDERATED` engine did not permit the local and remote tables to have different names. (Bug #26257)
- Database and table names have a maximum length of 64 characters (even if they contain multi-byte characters), but were truncated to 64 bytes.

  Note

  This improves on a previous fix made for this bug in MySQL 5.1.12.

  (Bug #21432)
- The range optimizer could consume a combinatorial amount of memory for certain classes of `WHERE` clauses. (Bug #26624)
- On Linux, the server could not create temporary tables if `lower_case_table_names` [492] was set to 1 and the value of `tmpdir` [534] was a directory name containing any uppercase letters. (Bug #27653)
- Storing `NULL` values in spatial fields caused excessive memory allocation and crashes on some systems. (Bug #27164)
- Some upgrade problems are detected and better error messages suggesting that `mysql_upgrade` be run are produced. (Bug #24248)
- `mysqldump` could not dump log tables. (Bug #26121)
- Duplicate members in `SET` or `ENUM` definitions were not detected. Now they result in a warning; if strict SQL mode is enabled, an error occurs instead. (Bug #27069)
- On Windows, `mysql_upgrade` was sensitive to lettercase of the names of some required components. (Bug #25405)
- Executing an `INSERT ... SELECT ... FROM INFORMATION_SCHEMA.GLOBAL_STATUS` statement from within an event caused a server crash. (Bug #26174)
- A subquery could get incorrect values for references to outer query columns when it contained aggregate functions that were aggregated in outer context. (Bug #27321)
- In a `MEMORY` table, using a `BTREE` index to scan for updatable rows could lead to an infinite loop. (Bug #26996)
- For `DELETE FROM tbl_name ORDER BY col_name` (with no `WHERE` or `LIMIT` clause), the server did not check whether *`col_name`* was a valid column in the table. (Bug #26186)
- `mysqldump` crashed for `MERGE` tables if the `--complete-insert` [295] (`-c`) option was given. (Bug #25993)
- For the `INFORMATION_SCHEMA SESSION_STATUS` and `GLOBAL_STATUS` tables, some status values were incorrectly converted to the data type of the `VARIABLE_VALUE` column. (Bug #27327)
- The `LEAST()` [943] and `GREATEST()` [942] functions compared `DATE` and `DATETIME` values as strings, which in some cases could lead to an incorrect result. (Bug #27759)
- `MBRDisjoint()`, `MBREqual()`, `MBRIntersects()`, `MBROverlaps()`, `MBRTouches()`, and `MBRWithin()` were inadvertently omitted from recent versions of MySQL (5.1.14 to 5.1.17). (Bug #24588)

- Selecting the result of `AVG()` [1045] within a `UNION` could produce incorrect values. (Bug #24791)
- `mysql_install_db` is supposed to detect existing system tables and create only those that do not exist. Instead, it was exiting with an error if tables already existed. (Bug #27783)
- During a call to `mysql_change_user()`, when authentication fails or the database to change to is unknown, a subsequent call to any function that does network communication leads to packets out of order. This problem was introduced in MySQL 5.1.14. (Bug #25371)
- The range optimizer could cause the server to run out of memory. (Bug #26625)
- `SELECT COUNT(*)` from a table containing a `DATETIME NOT NULL` column could produce spurious warnings with the `NO_ZERO_DATE` [575] SQL mode enabled. (Bug #22824)
- `ON DUPLICATE KEY UPDATE` failed for a table partitioned by `KEY` on a primary key `VARCHAR` column. (Bug #27123)
- If `CREATE TABLE t1 LIKE t2` failed due to a full disk, an empty `t2.frm` file could be created but not removed. This file then caused subsequent attempts to create a table named `t2` to fail. This is easily corrected at the file system level by removing the `t2.frm` file manually, but now the server removes the file if the create operation does not complete successfully. (Bug #25761)
- String truncation upon insertion into an integer or year column did not generate a warning (or an error in strict mode). (Bug #27176, Bug #26359)
- Creating a temporary table with `InnoDB` when using the one-file-per-table setting, and when the host file system for temporary tables was `tmpfs`, would cause an assertion within `mysqld`. This was due to the use of `O_DIRECT` when opening the temporary table file. (Bug #26662)
- Concurrent `CREATE SERVER` and `ALTER SERVER` statements could cause a deadlock. (Bug #25721)
- In certain situations, `MATCH ... AGAINST` returned false hits for `NULL` values produced by `LEFT JOIN` when no full-text index was available. (Bug #25729)
- `make_win_bin_dist` neglected to copy some required `MyISAM` table files. (Bug #26922)
- Difficult repair or optimization operations could cause an assertion failure, resulting in a server crash. (Bug #25289)
- `CREATE SERVER`, `DROP SERVER`, and `ALTER SERVER` did not require any privileges. Now these statements require the `SUPER` [628] privilege. (Bug #25671)
- Certain queries that used uncorrelated scalar subqueries caused `EXPLAIN` to crash. (Bug #27807)
- When MySQL logged slow query information to a `CSV` table, it used an incorrect formula to calculate the `query_time` and `lock_time` values. (Bug #27638)
- For `InnoDB` tables having a clustered index that began with a `CHAR` or `VARCHAR` column, deleting a record and then inserting another before the deleted record was purged could result in table corruption. (Bug #26835)
- With `NO_AUTO_VALUE_ON_ZERO` [573] SQL mode enabled, `LOAD DATA` operations could assign incorrect `AUTO_INCREMENT` values. (Bug #27586)
- An interaction between `SHOW TABLE STATUS` and other concurrent statements that modify the table could result in a divide-by-zero error and a server crash. (Bug #27516)
- For `SHOW ENGINE INNODB STATUS`, the `LATEST DEADLOCK INFORMATION` was not always cleared properly. (Bug #25494)
- Comparisons using row constructors could fail for rows containing `NULL` values. (Bug #27704)

- A possible buffer overflow in `SHOW PROCEDURE CODE` was removed. (Bug #26303)
- `COUNT(decimal_expr)` [1045] sometimes generated a spurious truncation warning. (Bug #21976)
- Several math functions produced incorrect results for large unsigned values. `ROUND()` [977] produced incorrect results or a crash for a large number-of-decimals argument. (Bug #24912)
- On Windows, connection handlers did not properly decrement the server's thread count when exiting. (Bug #25621)
- Duplicates were not properly identified among (potentially) long strings used as arguments for `GROUP_CONCAT(DISTINCT)` [1046]. (Bug #26815)
- A race condition between `DROP TABLE` and `SHOW TABLE STATUS` could cause the latter to display incorrect information. (Bug #27499)
- `SELECT * INTO OUTFILE ... FROM INFORMATION_SCHEMA.SCHEMATA` failed with an `Access denied` error, even for a user who had the `FILE` [626] privilege. (Bug #28181)
- Nested aggregate functions could be improperly evaluated. (Bug #27363)
- `mysqld` did not check the length of option values and could crash with a buffer overflow for long values. (Bug #27715)
- A performance degradation was observed for outer join queries to which a not-exists optimization was applied. (Bug #28188)
- `mysqldump` could crash or exhibit incorrect behavior when some options were given very long values, such as `--fields-terminated-by="some very long string"`. The code has been cleaned up to remove a number of fixed-sized buffers and to be more careful about error conditions in memory allocation. (Bug #26346)
- The `AUTO_INCREMENT` value would not be correctly reported for `InnoDB` tables when using `SHOW CREATE TABLE` statement or `mysqldump` command. (Bug #23313)
- Comparison of a `DATE` with a `DATETIME` did not treat the `DATE` as having a time part of `00:00:00`. (Bug #27590)

  References: See also Bug #32198.
- `ALTER VIEW` requires the `CREATE VIEW` [626] and `DROP` [626] privileges for the view. However, if the view was created by another user, the server erroneously required the `SUPER` [628] privilege. (Bug #26813)
- In some cases, the optimizer preferred a range or full index scan access method over lookup access methods when the latter were much cheaper. (Bug #19372)
- On Windows, if the server was installed as a service, it did not auto-detect the location of the data directory. (Bug #20376)
- Changing a `utf8` column in an `InnoDB` table to a shorter length did not shorten the data values. (Bug #20095)
- Conversion of `DATETIME` values in numeric contexts sometimes did not produce a double (`YYYYMMDDHHMMSS.uuuuuu`) value. (Bug #16546)
- `INSERT...ON DUPLICATE KEY UPDATE` could cause `Error 1032: Can't find record in ...` for inserts into an `InnoDB` table unique index using key column prefixes with an underlying `utf8` string column. (Bug #13191)
- Having the `EXECUTE` [626] privilege for a routine in a database should make it possible to `USE` that database, but the server returned an error instead. This has been corrected. As a result of the

change, `SHOW TABLES` for a database in which you have only the `EXECUTE` [626] privilege returns an empty set rather than an error. (Bug #9504)

Changes in MySQL 5.1.17 (2007-04-04)

This is a new Beta development release, fixing recently discovered bugs.

Note

This Beta release, as any other pre-production release, should not be installed on *production* level systems or systems with critical data. It is good practice to back up your data before installing any new version of software. Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at http://bugs.mysql.com/ for more details about the individual bugs fixed in this version.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details, please see http://www.mysql.com/products/enterprise.

Functionality Added or Changed

- **Incompatible Change**: Scheduled events now use the session time zone that is current when a `CREATE EVENT` or `ALTER EVENT` statement executes is used to interpret times specified in the event definition (rather than UTC as in previous releases). The session time zone becomes the event time zone; that is, the time zone that is used for event scheduling and is in effect within the event as it executes. Because of this change, scheduled event metadata now includes time zone information, which can be seen in the `TIME_ZONE` column of the `INFORMATION_SCHEMA.EVENTS` table and the `Time zone` column in the output of the `SHOW EVENTS` statement. These columns have been added in this release, along with a `time_zone` [533] column in the `mysql.event` table. Due to these changes, events created in previous versions of MySQL cannot be created, viewed, or used until `mysql.event` has been upgraded.

  For retrievals from `INFORMATION_SCHEMA.EVENTS` or `SHOW EVENTS`, times previously displayed using UTC now use the event time zone. (Bug #16420)

- **Important Change**: **Replication**: The following options for controlling replication master configuration on a slave are now deprecated.

  - `--master-host` [1630]
  - `--master-user` [1632]
  - `--master-password` [1630]
  - `--master-port` [1631]
  - `--master-connect-retry` [1630]
  - `--master-ssl` [1631]
  - `--master-ssl-ca` [1631]
  - `--master-ssl-capath` [1631]
  - `--master-ssl-cert` [1631]
  - `--master-ssl-cipher` [1631]
  - `--master-ssl-key` [1631]

To change the master configuration on a slave you should use the `CHANGE MASTER TO` statement.

References: See also Bug #21490.

- **Important Change**: The `CREATE EVENT` and `ALTER EVENT` statements now support a `DEFINER` clause, similar to that used in the `CREATE TRIGGER` statement.

  See `CREATE EVENT` Syntax, for detailed information. (Bug #16425)

- **MySQL Cluster**: Added the `--skip-table-check` option (short form `-s`) for `ndb_restore`, which causes the restoration process to ignore any changes that may have occurred in table schemas after the backup was made. Previously, this was the default behavior.

  See `ndb_restore` — Restore a MySQL Cluster Backup, for more information. (Bug #24363)

- **MySQL Cluster**: For `ALTER TABLE` statements, `ADD INDEX` and `DROP INDEX` operations for dynamic (variable-width) columns on `NDB` tables are now performed as online operations (no table copying). This is also true for `CREATE INDEX` and `DROP INDEX`. Renaming of `NDB` and `MyISAM` tables and of columns in such tables is now performed in place without copying or locking the tables. As a result, these operations are now performed much more quickly than previously.

  For more information, see `ALTER TABLE` Online Operations, `CREATE INDEX` Syntax, and `DROP INDEX` Syntax.

- Added the `--service-startup-timeout` [245] option for `mysql.server` to specify how long to wait for the server to start. If the server does not start within the timeout period, `mysql.server` exits with an error. (Bug #26952)

- Added a `--no-beep` [281] option to `mysqladmin`. It suppresses the warning beep that is emitted by default for errors such as a failure to connect to the server. (Bug #26964)

- Prefix lengths for columns in `SPATIAL` indexes can no longer be specified. For tables created in older versions of MySQL that have `SPATIAL` indexes containing prefixed columns, dumping and reloading the table causes the indexes to be created with no prefixes. (The full column width of each column is indexed.) (Bug #26794)

- The syntax for index hints has been extended to enable more fine-grained control over the optimizer's selection of an execution plan for various phases of query processing. See Index Hint Syntax. (Bug #21174)

- Added the `innodb_stats_on_metadata` [1381] system variable to enable control over whether `InnoDB` performs statistics gathering when metadata statements are executed. See `InnoDB` Startup Options and System Variables. (Bug #26598)

- Statements that affect `mysql` database tables now are written to the binary log using the following rules:

  - Data manipulation statements such as `INSERT` that change data in `mysql` database tables directly are logged according to the settings of the `binlog_format` [1654] system variable.

  - Statements such as `GRANT` that change the `mysql` database indirectly are logged as statements regardless of the value of `binlog_format` [1654].

  For more details, see Logging Format for Changes to `mysql` Database Tables. (Bug #25091)

- The server now includes a timestamp in error messages that are logged as a result of unhandled signals (such as `mysqld got signal 11` messages). (Bug #24878)

- Added the `--secure-file-priv` [442] option for `mysqld`, which limits the effect of the `LOAD_FILE()` [953] function and the `LOAD DATA` and `SELECT ... INTO OUTFILE` statements to work only with files in a given directory. (Bug #18628)

- Prepared statements now use the query cache under the conditions described in How the Query Cache Operates. (Bug #735)
- Added the `old_mode` system variable to cause the server to revert to certain behaviors present in older versions. Currently, this variable affects handling of index hints. See Index Hint Syntax.
- Data manipulation statements such as `INSERT` that change data in `mysql` database tables directly are logged according to the settings of the `binlog_format` [1654] system variable.
- Added the read-only `hostname` [481] system variable, which the server sets at startup to the server host name.
- Statements such as `GRANT` that change the `mysql` database indirectly are logged as statements regardless of the value of `binlog_format` [1654].
- Added the `thread_handling` [532] system variable to control whether the server use a single thread or one thread per connection. The `--one-thread` [438] option now is deprecated; use `--thread_handling=one-thread` instead.

Bugs Fixed

- **Incompatible Change**: `INSERT DELAYED` statements are not supported for `MERGE` tables, but the `MERGE` storage engine was not rejecting such statements, resulting in table corruption. Applications previously using `INSERT DELAYED` into `MERGE` table will break when upgrading to versions with this fix. To avoid the problem, remove `DELAYED` from such statements. (Bug #26464)
- **Important Note**: The parser accepted invalid code in SQL condition handlers, leading to server crashes or unexpected execution behavior in stored programs. Specifically, the parser permitted a condition handler to refer to labels for blocks that enclose the handler declaration. This was incorrect because block label scope does not include the code for handlers declared within the labeled block.

  The parser now rejects this invalid construct, but if you perform a binary upgrade (without dumping and reloading your databases), existing handlers that contain the construct are still invalid and should be rewritten *even if they appear to function as you expect.*

  To find affected handlers, use `mysqldump` to dump all stored procedures and functions, triggers, and events. Then attempt to reload them into an upgraded server. Handlers that contain illegal label references will be rejected.

  For more information about condition handlers and writing them to avoid invalid jumps, see `DECLARE ... HANDLER` Syntax. (Bug #26503)
- **MySQL Cluster**: An invalid pointer was returned following a `FSCLOSECONF` signal when accessing the REDO logs during a node restart or system restart. (Bug #26515)
- **MySQL Cluster**: After putting the cluster in single user mode from one MySQL server, trying to drop an `NDB` table from a second MySQL server also connected to the cluster would cause the second MySQL server to hang. (Bug #27254)
- **MySQL Cluster**: An infinite loop in an internal logging function could cause trace logs to fill up with `Unknown Signal type` error messages and thus grow to unreasonable sizes. (Bug #26720)
- **MySQL Cluster**: `mysqld` processes would sometimes crash under high load. (Bug #26825)
- **MySQL Cluster**: (Disk Data): Under some circumstances, a data node could fail during restart while flushing Disk Data UNDO logs. (Bug #27102)
- **MySQL Cluster**: Creating a table on one SQL node while in single user mode caused other SQL nodes to crash. (Bug #26997)
- **MySQL Cluster**: The management client command *`node_id`* `STATUS` displayed the message `Node` *`node_id`*`: not connected` when *`node_id`* was not the node ID of a data node.

Note

The `ALL STATUS` command in the cluster management client still displays status information for data nodes only. This is by design. See Commands in the MySQL Cluster Management Client, for more information.

(Bug #21715)

- **MySQL Cluster**: Using only the `--print_data` [1997] option (and no other options) with `ndb_restore` caused `ndb_restore` to fail. (Bug #26741)

  References: This bug was introduced by Bug #14612.

- **MySQL Cluster**: The output from `ndb_restore --print_data [1997]` was incorrect for a backup made of a database containing tables with `TINYINT` or `SMALLINT` columns. (Bug #26740)

- **MySQL Cluster**: When a data node was taking over as the master node, a race condition could sometimes occur as the node was assuming responsibility for handling of global checkpoints. (Bug #27283)

- **MySQL Cluster**: It was not possible to set `LockPagesInMainMemory` [1832] equal to `0`. (Bug #27291)

- **MySQL Cluster**: A race condition could sometimes occur if the node acting as master failed while node IDs were still being allocated during startup. (Bug #27286)

- **MySQL Cluster**: `mysqld` could crash shortly after a data node failure following certain DML operations. (Bug #27169)

- **MySQL Cluster**: The same failed request from an API node could be handled by the cluster multiple times, resulting in reduced performance. (Bug #27087)

- **MySQL Cluster**: When performing an upgrade or downgrade, no specific error information was made available when trying to upgrade data nodes or SQL nodes before upgrading management nodes. (Bug #21296)

- **MySQL Cluster**: The failure of a data node while restarting could cause other data nodes to hang or crash. (Bug #27003)

- **MySQL Cluster**: Some values of `MaxNoOfTables` [1829] caused the error `Job buffer congestion` to occur. (Bug #19378)

- **Replication**: For `INSERT ... ON DUPLICATE KEY UPDATE` statements where some `AUTO_INCREMENT` values were generated automatically for inserts and some rows were updated, one auto-generated value was lost per updated row, leading to faster exhaustion of the range of the `AUTO_INCREMENT` column.

  Because the original problem can affect replication (different values on master and slave), it is recommended that the master and its slaves be upgraded to the current version. (Bug #24432)

- **Replication**: A multiple-row delayed insert with an auto-increment column could cause duplicate entries to be created on the slave in a replication environment. (Bug #26116, Bug #25507)

- **Replication**: Duplicating the usage of a user variable in a stored procedure or trigger would not be replicated correctly to the slave. (Bug #25167)

- **Replication**: `DROP TRIGGER` statements would not be filtered on the slave when using the `replication-wild-do-table` option. (Bug #24478)

- **Replication**: Replication between master and slave would infinitely retry binary log transmission where the `max_allowed_packet` on the master was larger than that on the slave if the size of the transfer was between these two values. (Bug #23775)

- **Replication**: Loading data using `LOAD DATA INFILE` may not replicate correctly (due to character set incompatibilities) if the `character_set_database` [465] variable is set before the data is loaded. (Bug #15126)
- **Replication**: User defined variables used within stored procedures and triggers are not replicated correctly when operating in statement-based replication mode. (Bug #14914, Bug #20141)
- **Disk Data**: `DROP INDEX` on a Disk Data table did not always move data from memory into the tablespace. (Bug #25877)
- **Disk Data**: Creating multiple Disk Data tables using different tablespaces could sometimes cause the cluster to fail. (Bug #25992)
- **Disk Data**: Use of a tablespace whose `INITIAL_SIZE` was greater than 1 GB could cause the cluster to crash. (Bug #26487)
- **Disk Data**: When creating a log file group, setting `INITIAL_SIZE` to less than `UNDO_BUFFER_SIZE` caused data nodes to crash. (Bug #25743)
- **Disk Data**: A memory overflow could occur with tables having a large amount of data stored on disk, or with queries using a very high degree of parallelism on Disk Data tables. (Bug #26514)
- **Disk Data**: `ALTER TABLE ... ADD COLUMN ...` on a Disk Data table moved data for existing nonindexed columns from the tablespace into memory. (Bug #25880)
- **Cluster Replication**: The simultaneous failure of a data node and an SQL node could cause replication to fail. (Bug #27005)
- **Cluster API**: `NAND` and `NOR` operations with `NdbScanFilter` did not perform correctly. (Bug #24568)
- **Cluster API**: A delete operation using a scan followed by an insert using a scan could cause a data node to fail. (Bug #27203)
- **Cluster API**: You can now use the `ndb_mgm_check_connection()` function to determine whether a management server is running.
- On Windows, debug builds of `mysqlbinlog` could fail with a memory error. (Bug #23736)
- IF(*`expr`*, *`unsigned_expr`*, *`unsigned_expr`*) was evaluated to a signed result, not unsigned. This has been corrected. The fix also affects constructs of the form `IS [NOT] {TRUE|FALSE}`, which were transformed internally into `IF()` [947] expressions that evaluated to a signed result.

  For existing views that were defined using `IS [NOT] {TRUE|FALSE}` constructs, there is a related implication. The definitions of such views were stored using the `IF()` [947] expression, not the original construct. This is manifest in that `SHOW CREATE VIEW` shows the transformed `IF()` [947] expression, not the original one. Existing views will evaluate correctly after the fix, but if you want `SHOW CREATE VIEW` to display the original construct, you must drop the view and re-create it using its original definition. New views will retain the construct in their definition. (Bug #24532)
- `X() IS NULL` and `Y() IS NULL` comparisons failed when `X()` [1067] and `Y()` [1067] returned `NULL`. (Bug #26038)
- `DOUBLE` values such as `20070202191048.000000` were being treated as illegal arguments by `WEEK()` [996]. (Bug #23616)
- Use of a `GROUP BY` clause that referred to a stored function result together with `WITH ROLLUP` caused incorrect results. (Bug #25373)
- Indexes on `TEXT` columns were ignored when `ref` [697] accesses were evaluated. (Bug #25971)
- For an `INSERT` statement that should fail due to a column with no default value not being assigned a value, the statement succeeded with no error if the column was assigned a value in an `ON DUPLICATE KEY UPDATE` clause, even if that clause was not used. (Bug #26261)

- When using the result of `SEC_TO_TIME()` [991] for time value greater than 24 hours in an `ORDER BY` clause, either directly or through a column alias, the rows were sorted incorrectly as strings. (Bug #26672)
- `SHOW CREATE EVENT` failed to display the `STARTS` and `ENDS` clauses for an event defined with `STARTS NOW()`, `ENDS NOW()`, or both. (Bug #26429)
- Expressions involving `SUM()` [1047], when used in an `ORDER BY` clause, could lead to out-of-order results. (Bug #25376)
- An `INSERT` trigger invoking a stored routine that inserted into a table other than the one on which the trigger was defined would fail with a `Table '...' doesn't exist` referring to the second table when attempting to delete records from the first table. (Bug #21825)
- If a thread previously serviced a connection that was killed, excessive memory and CPU use by the thread occurred if it later serviced a connection that had to wait for a table lock. (Bug #25966)
- A query of type `index_merge` [697], and with a `WHERE` clause having the form `WHERE indexed_column_1=value_1 OR indexed_column_2=value_2` on a partitioned table caused the server to crash. (Bug #26117)
- Use of a subquery containing a `UNION` with an invalid `ORDER BY` clause caused a server crash. (Bug #26661)
- A stored procedure that made use of cursors failed when the procedure was invoked from a stored function. (Bug #25345)
- Using `mysqlbinlog` on a binary log would crash if there were a large number of row-based events related to a single statement. (Bug #25628)
- MySQL would not compile when configured using `--without-query-cache`. (Bug #25075)
- Use of a subquery containing `GROUP BY` and `WITH ROLLUP` caused a server crash. (Bug #26830)
- Invalid optimization of pushdown conditions for queries where an outer join was guaranteed to read only one row from the outer table led to results with too few rows. (Bug #26963)
- A result set column formed by concatenation of string literals was incomplete when the column was produced by a subquery in the `FROM` clause. (Bug #26738)
- `UNHEX() IS NULL` comparisons failed when `UNHEX()` [958] returned `NULL`. (Bug #26537)
- `LOAD DATA INFILE` sent an okay to the client before writing the binary log and committing the changes to the table had finished, thus violating ACID requirements. (Bug #26050)
- Inserting `utf8` data into a `TEXT` column that used a single-byte character set could result in spurious warnings about truncated data. (Bug #25815)
- `NOW()` [990] returned the wrong value in statements executed at server startup with the `--init-file` [429] option. (Bug #23240)
- `BENCHMARK()` [1032] did not work correctly for expressions that produced a `DECIMAL` result. (Bug #26093)
- A view on a join is insertable for `INSERT` statements that store values into only one table of the join. However, inserts were being rejected if the inserted-into table was used in a self-join because MySQL incorrectly was considering the insert to modify multiple tables of the view. (Bug #25122)
- For `MERGE` tables defined on underlying tables that contained a short `VARCHAR` column (shorter than four characters), using `ALTER TABLE` on at least one but not all of the underlying tables caused the table definitions to be considered different from that of the `MERGE` table, even if the `ALTER TABLE` did not change the definition. (Bug #26881)

- A reference to a nonexistent column in the `ORDER BY` clause of an `UPDATE ... ORDER BY` statement could cause a server crash. (Bug #25126)
- `EXPLAIN EXTENDED` did not show `WHERE` conditions that were optimized away. (Bug #22331)
- For a stored procedure containing a `SELECT` statement that used a complicated join with an `ON` expression, the expression could be ignored during re-execution of the procedure, yielding an incorrect result. (Bug #20492)
- In some error messages, inconsistent format specifiers were used for the translations in different languages. `comp_err` (the error message compiler) now checks for mismatches. (Bug #26571)
- If the server was started with `--skip-grant-tables` [443], selecting from `INFORMATION_SCHEMA` tables caused a server crash. (Bug #26285)
- On Windows, debug builds of `mysqld` could fail with heap assertions. (Bug #25765)
- On 64-bit Windows, large timestamp values could be handled incorrectly. (Bug #26536)
- Added support for `--debugger=dbx` for `mysql-test-run.pl` and added support for `--debugger=devenv`, `--debugger=DevEnv`, and `--debugger=/path/to/devenv`. (Bug #26792)
- Setting the `slow_query_log_file` [523] system variable caused log output to go tothe general log, not the slow query log. (Bug #23225)
- A user-defined variable could be assigned an incorrect value if a temporary table was employed in obtaining the result of the query used to determine its value. (Bug #24010)
- SSL connections failed on Windows. (Bug #26678)
- `SHOW ENGINE MUTEX STATUS` failed to produce an `Unknown table engine` error.

  See `SHOW ENGINE` Syntax. (Bug #24392)
- For `MEMORY` tables, extending the length of a `VARCHAR` column with `ALTER TABLE` might result in an unusable table. (Bug #26080)
- On Windows, the server exhibited a file-handle leak after reaching the limit on the number of open file descriptors. (Bug #25222)
- The server could crash if two or more threads initiated query cache resize operation at moments very close in time. (Bug #23527)
- For `INSERT ... ON DUPLICATE KEY UPDATE` statements on tables containing `AUTO_INCREMENT` columns, `LAST_INSERT_ID()` [1036] was reset to 0 if no rows were successfully inserted or changed. “Not changed” includes the case where a row was updated to its current values, but in that case, `LAST_INSERT_ID()` [1036] should not be reset to 0. Now `LAST_INSERT_ID()` [1036] is reset to 0 only if no rows were successfully inserted or touched, whether or not touched rows were changed. (Bug #27033)

  References: See also Bug #27210, Bug #27006. This bug was introduced by Bug #19978.
- When a stored routine attempted to execute a statement accessing a nonexistent table, the error was not caught by the routine's exception handler. (Bug #20713, Bug #8407)
- `VIEW` restrictions were applied to `SELECT` statements after a `CREATE VIEW` statement failed, as though the `CREATE` had succeeded. (Bug #25897)
- `CURDATE()` [982] is less than `NOW()` [990], either when comparing `CURDATE()` [982] directly (`CURDATE() < NOW()` is true) or when casting `CURDATE()` [982] to `DATE` (`CAST(CURDATE() AS DATE) < NOW()` is true). However, storing `CURDATE()` [982] in a `DATE` column and comparing *`col_name`* `< NOW()` incorrectly yielded false. This is fixed by comparing a `DATE` column as `DATETIME` for comparisons to a `DATETIME` constant. (Bug #21103)

- When nesting stored procedures within a trigger on a table, a false dependency error was thrown when one of the nested procedures contained a `DROP TABLE` statement. (Bug #22580)
- The `REPEAT()` [955] function did not permit a column name as the *`count`* parameter. (Bug #25197)
- It was not possible to use XPath keywords as tag names for expressions used in the `ExtractValue()` [1016] function. (Bug #24747)
- Queries that used a temporary table for the outer query when evaluating a correlated subquery could return incorrect results. (Bug #23800)
- `mysqlimport` used a variable of the wrong type for the `--use-threads` [309] option, which could cause a crash on some architectures. (Bug #23814)
- Several deficiencies in resolution of column names for `INSERT ... SELECT` statements were corrected. (Bug #25831)
- For some values of the position argument, the `INSERT()` [953] function could insert a NUL byte into the result. (Bug #26281)
- An `INSERT ... ON DUPLICATE KEY UPDATE` statement might modify values in a table but not flush affected data from the query cache, causing subsequent selects to return stale results. This made the combination of query cache plus `ON DUPLICATE KEY UPDATE` very unreliable. (Bug #27210)

  References: See also Bug #27006, Bug #27033. This bug was introduced by Bug #19978.
- Instance Manager did not remove the angel PID file on a clean shutdown. (Bug #22511)
- Setting `event_scheduler = 1` [474] or `event_scheduler = ON` [474] caused the server to crash if the server had been started with `--skip-grant-tables` [443]. Starting the server with `--skip-grant-tables` [443] now causes `event_scheduler` [474] to be set to `DISABLED` automatically, overriding any other value that may have been set. (Bug #26807)
- Creating a table with latin characters in the name caused the output of `SHOW FULL TABLES` to have `ERROR` for the table type. (Bug #25081)
- `SELECT ... INTO OUTFILE` with a long `FIELDS ENCLOSED BY` value could crash the server. (Bug #27231)
- Increasing the width of a `DECIMAL` column could cause column values to be changed. (Bug #24558)
- Views that used a scalar correlated subquery returned incorrect results. (Bug #26560)
- The server could hang during binary log rotation. (Bug #26079)
- When using certain server SQL modes, the `mysql.proc` table was not created by `mysql_install_db`. (Bug #23669)
- In certain cases it could happen that deleting a row corrupted an `RTREE` index. This affected indexes on spatial columns. (Bug #25673)
- `INSERT DELAYED` statements inserted incorrect values into `BIT` columns. (Bug #26238)
- `IN ((subquery))`, `IN (((subquery)))`, and so forth, are equivalent to `IN (subquery)`, which is always interpreted as a table subquery (so that it is permitted to return more than one row). MySQL was treating the “over-parenthesized” subquery as a single-row subquery and rejecting it if it returned more than one row. This bug primarily affected automatically generated code (such as queries generated by Hibernate), because humans rarely write the over-parenthesized forms. (Bug #21904)
- `MyISAM` tables converted to `ARCHIVE` were excessively large. (Bug #27533)

- When attempting to call a stored procedure creating a table from a trigger on a table `tbl` in a database `db`, the trigger failed with `ERROR 1146 (42S02): Table 'db.tbl' doesn't exist`. However, the actual reason that such a trigger fails is due to the fact that `CREATE TABLE` causes an implicit `COMMIT`, and so a trigger cannot invoke a stored routine containing this statement. A trigger which does so now fails with `ERROR 1422 (HY000): Explicit or implicit commit is not permitted in stored function or trigger`, which makes clear the reason for the trigger's failure. (Bug #18914)

- For `SUBSTRING()` [957] evaluation using a temporary table, when `SUBSTRING()` [957] was used on a LONGTEXT column, the `max_length` metadata value of the result was incorrectly calculated and set to 0. Consequently, an empty string was returned instead of the correct result. (Bug #15757)

- The creation of MySQL system tables was not checked for by `mysql-test-run.pl`. (Bug #20166)

- Local variables in stored routines or triggers, when declared as the `BIT` type, were interpreted as strings. (Bug #12976)

- For *`expr`* `IN(`*`value_list`*`)`, the result could be incorrect if `BIGINT UNSIGNED` values were used for *`expr`* or in the value list. (Bug #19342)

- The update columns for `INSERT ... SELECT ... ON DUPLICATE KEY UPDATE` could be assigned incorrect values if a temporary table was used to evaluate the `SELECT`. (Bug #16630)

- When a `TIME_FORMAT()` [994] expression was used as a column in a `GROUP BY` clause, the expression result was truncated. (Bug #20293)

- For index reads, the `BLACKHOLE` engine did not return end-of-file (which it must because `BLACKHOLE` tables contain no rows), causing some queries to crash. (Bug #19717)

- The conditions checked by the optimizer to permit use of indexes in `IN` predicate calculations were unnecessarily tight and were relaxed. (Bug #20420)

- While preparing prepared statements, the server acquired unnecessary table write locks. (Bug #18326)

- For some operations, system tables in the `mysql` database must be accessed. For example, the `HELP` statement requires the contents of the server-side help tables, and `CONVERT_TZ()` [981] might need to read the time zone tables. However, to perform such operations while a `LOCK TABLES` statement is in effect, the server required you to also lock the requisite system tables explicitly or a lock error occurred:

  ```
  mysql> LOCK TABLE t1 READ;
  Query OK, 0 rows affected (0.02 sec)
  mysql> HELP HELP;
  ERROR 1100 (HY000) at line 4: Table 'help_topic' was not
  locked with LOCK TABLES
  ```

  Now, the server implicitly locks the system tables for reading as necessary so that you need not lock them explicitly. These tables are treated as just described:

  ```
  mysql.help_category
  mysql.help_keyword
  mysql.help_relation
  mysql.help_topic
  mysql.proc
  mysql.time_zone
  mysql.time_zone_leap_second
  mysql.time_zone_name
  mysql.time_zone_transition
  mysql.time_zone_transition_type
  ```

  If you want to explicitly place a `WRITE` lock on any of those tables with a `LOCK TABLES` statement, the table must be the only one locked; no other table can be locked with the same statement. (Bug #9953)

Changes in MySQL 5.1.16 (2007-02-26)

This is a new Beta development release, fixing recently discovered bugs.

Note

This Beta release, as any other pre-production release, should not be installed on *production* level systems or systems with critical data. It is good practice to back up your data before installing any new version of software. Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at http://bugs.mysql.com/ for more details about the individual bugs fixed in this version.

Note

After release, a trigger failure problem was found to have been introduced. (Bug #27006) Users affected by this issue should upgrade to MySQL 5.1.17, which corrects the problem.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details, please see http://www.mysql.com/products/enterprise.

Functionality Added or Changed

- **Cluster API**: **Incompatible Change**: The `AbortOption` type is now a member of the `NdbOperation` class; its values and behavior have also changed. `NdbTransaction::AbortOption` can no longer be used, and applications written against the NDB API may need to be rewritten and recompiled to accommodate these changes. For more information about this change, see The `NdbOperation::AbortOption` Type.

  This also affects the behavior of the `NdbTransaction::execute()` method, which now reports failure only if the transaction was actually aborted.

- **MySQL Cluster**: Previously, when a data node failed to start more than 8 times in succession, this caused a forced shutdown of the cluster. Now, when a data node fails to start 7 consecutive times, the node does not start again until it is started with the `--initial` option, and a warning to this effect is written to the error log. (Bug #25984)

- **MySQL Cluster**: In the event that all cluster management and API nodes are configured with `ArbitrationRank = 0`, `ndb_mgmd` now issues the following warning when starting: `Cluster configuration warning: Neither MGM nor API nodes are configured with arbitrator, may cause complete cluster shutdown in case of host failure`. (Bug #23546)

- **MySQL Cluster**: A number of new and more descriptive error messages covering transporter errors were added. (Bug #22025)

- **MySQL Cluster**: A new configuration parameter `MemReportFrequency` [1849] enables additional control of data node memory usage. Previously, only warnings at predetermined percentages of memory allocation were given; setting this parameter enables that behavior to be overridden.

- **Cluster API**: A new `ndb_mgm_get_clusterlog_loglevel()` function was added to the MGM API.

- The `localhost` anonymous user account created during MySQL installation on Windows now has no global privileges. Formerly this account had all global privileges. For operations that require global privileges, the `root` account can be used instead. (Bug #24496)

- In the `INFORMATION_SCHEMA REFERENTIAL_CONSTRAINTS` table, the `UNIQUE_CONSTRAINT_NAME` column incorrectly named the referenced table. Now it names the referenced constraint, and a new column, `REFERENCED_TABLE_NAME`, names the referenced table. (Bug #21713)
- `RAND()` [975] now permits nonconstant initializers (such as a column name) as its argument. In this case, the seed is initialized with the value for each invocation of `RAND()` [975]. (One implication of this is that for equal argument values, `RAND()` [975] will return the same value each time.) (Bug #6172)
- The bundled yaSSL library was upgraded to version 1.5.8.
- Added the `--auto-generate-sql-load-type` [316] and `--auto-generate-sql-write-number` [317] options for `mysqlslap`.

Bugs Fixed

- **Security Fix**: Using an `INFORMATION_SCHEMA` table with `ORDER BY` in a subquery could cause a server crash.

  We would like to thank Oren Isacson of Flowgate Security Consulting and Stefan Streichsbier of SEC Consult for informing us of this problem. (Bug #24630, Bug #26556, CVE-2007-1420)
- **Partitioning**: **MySQL Cluster**: A query with an `IN` clause against an `NDB` table employing explicit user-defined partitioning did not always return all matching rows. (Bug #25821)
- **MySQL Cluster**: **Replication**: (Replication): Under some circumstances, the binary log thread could shut down while the slave SQL thread was still using it. (Bug #26015, Bug #26019)
- **MySQL Cluster**: **Replication**: (Replication): The error message `Last_Errno: 4294967295, Error in Write_rows event` now supplies a valid error code. (Bug #19896)
- **MySQL Cluster**: The `ndb_size.tmpl` file (necessary for using the `ndb_size.pl` script) was missing from binary distributions. (Bug #24191)
- **MySQL Cluster**: No appropriate error message was provided when there was insufficient REDO log file space for the cluster to start. (Bug #25801)
- **MySQL Cluster**: The message `Error 0 in readAutoIncrementValue(): no Error` was written to the error log whenever `SHOW TABLE STATUS` was performed on a Cluster table that did not have an `AUTO_INCREMENT` column.

  Note

  This improves on and supersedes an earlier fix that was made for this issue in MySQL 5.1.12.

  (Bug #21033)
- **MySQL Cluster**: The **`InvalidUndoBufferSize`** error used the same error code (`763`) as the **`IncompatibleVersions`** error. **`InvalidUndoBufferSize`** now uses its own error code (`779`). (Bug #26490)
- **MySQL Cluster**: Under some circumstances, following the restart of a management node, all data nodes would connect to it normally, but some of them subsequently failed to log any events to the management node. (Bug #26293)
- **MySQL Cluster**: An inadvertent use of unaligned data caused `ndb_restore` to fail on some 64-bit platforms, including Sparc and Itanium-2. (Bug #26739)
- **MySQL Cluster**: The `LockPagesInMainMemory` [1832] parameter was not read until after distributed communication had already started between cluster nodes. When the value of this

parameter was `1`, this could sometimes result in data node failure due to missed heartbeats. (Bug #26454)

- **MySQL Cluster**: Takeover for local checkpointing due to multiple failures of master nodes was sometimes incorrectly handled. (Bug #26457)
- **MySQL Cluster**: The failure of a data node when restarting it with `--initial` could lead to failures of subsequent data node restarts. (Bug #26481)
- **MySQL Cluster**: An `UPDATE` using an `IN` clause on an `NDB` table on which there was a trigger caused `mysqld` to crash. (Bug #25522)
- **MySQL Cluster**: A memory allocation failure in `SUMA` (the cluster Subscription Manager) could cause the cluster to crash. (Bug #25239)
- **MySQL Cluster**: A memory leak could cause problems during a node or cluster shutdown or failure. (Bug #25997)
- **MySQL Cluster**: Condition pushdown did not work with prepared statements. (Bug #26225)
- **MySQL Cluster**: When a node failed due to there being insufficient disk space to perform a local checkpoint, there was no indication that this was the source of the problem. Such a condition now produces an appropriate error message. (Bug #20121)
- **MySQL Cluster**: In the event that cluster backup parameters such as `BackupWriteSize` [1851] were incorrectly set, no appropriate error was issued to indicate that this was the case. (Bug #19146)
- **Replication**: If a slave server closed its relay log (for example, due to an error during log rotation), the I/O thread did not recognize this and still tried to write to the log, causing a server crash. (Bug #10798)
- **Cluster API**: **Disk Data**: A delete and a read performed in the same operation could cause one or more data nodes to crash. This could occur when the operation affected more than 5 columns concurrently, or when one or more of the columns was of the `VARCHAR` type and was stored on disk. (Bug #25794)
- **Cluster API**: After defining a delete operation (using `NdbOperation::deleteTuple()`) on a nonexistent primary key of a table having a `BLOB` or `TEXT` column, invoking `NdbTransaction::execute()` caused the calling application to enter an endless loop rather than raising an error.

  This issue also affected `ndb_restore`; when restoring tables containing `BLOB` or `TEXT` columns, this could cause it to consume all available memory and then crash. (Bug #24028)

  References: See also Bug #27308, Bug #30177.
- **Cluster API**: `libndbclient.so` was not versioned. (Bug #13522)
- Use of `ON DUPLICATE KEY UPDATE` defeated the usual restriction against inserting into a join-based view unless only one of the underlying tables is used. (Bug #25123)
- `ISNULL(DATE(NULL))` [942] and `ISNULL(CAST(NULL AS DATE))` [942] erroneously returned false. (Bug #23938)
- `readline` detection did not work correctly on NetBSD. (Bug #23293)
- A return value of `-1` from user-defined handlers was not handled well and could result in conflicts with server code. (Bug #24987)
- The `SEC_TO_TIME()` [991] and `QUARTER()` [990] functions sometimes did not handle `NULL` values correctly. (Bug #25643)

- With `ONLY_FULL_GROUP_BY` [575] enabled, the server was too strict: Some expressions involving only aggregate values were rejected as nonaggregate (for example, `MAX(a)` [1046] – `MIN(a)` [1047]). (Bug #23417)
- A query with `ORDER BY` and `GROUP BY` clauses where the `ORDER BY` clause had more elements than the `GROUP BY` clause caused a memory overrun leading to a crash of the server. (Bug #25172)
- View definitions that used the `!` operator were treated as containing the `NOT` operator, which has a different precedence and can produce different results. . (Bug #25580)
- `GROUP BY` and `DISTINCT` did not group `NULL` values for columns that have a `UNIQUE` index. . (Bug #25551)
- For an `InnoDB` table with any `ON DELETE` trigger, `TRUNCATE TABLE` mapped to `DELETE` and activated triggers. Now a fast truncation occurs and triggers are not activated. .

  Important

  As a result of this fix, `TRUNCATE TABLE` now requires the `DROP` [626] privilege rather than the `DELETE` [626] privilege.

  (Bug #23556)
- The `WITH CHECK OPTION` clause for views was ignored for updates of multiple-table views when the updates could not be performed on fly and the rows to update had to be put into temporary tables first. (Bug #25931)
- If a prepared statement accessed a view, access to the tables listed in the query after that view was checked in the security context of the view. (Bug #24404)
- For a `UNIQUE` index containing many `NULL` values, the optimizer would prefer the index for *`col`* `IS NULL` conditions over other more selective indexes. . (Bug #25407)
- A yaSSL program named `test` was installed, causing conflicts with the `test` system utility. It is no longer installed. (Bug #25417)
- `DISTINCT` queries that were executed using a loose scan for an `InnoDB` table that had been emptied caused a server crash. (Bug #26159)
- Some queries against `INFORMATION_SCHEMA` that used subqueries failed. . (Bug #23299)
- Using `ORDER BY` or `GROUP BY` could yield different results when selecting from a view and selecting from the underlying table. (Bug #26209)
- Some `UPDATE` statements were slower than in previous versions when the search key could not be converted to a valid value for the type of the search column. (Bug #24035)
- The arguments to the `ENCODE()` [1030] and the `DECODE()` [1029] functions were not printed correctly, causing problems in the output of `EXPLAIN EXTENDED` and in view definitions. (Bug #23409)
- If an `ORDER BY` or `GROUP BY` list included a constant expression being optimized away and, at the same time, containing single-row subselects that returned more that one row, no error was reported. If a query required sorting by expressions containing single-row subselects that returned more than one row, execution of the query could cause a server crash. (Bug #24653)
- Type conversion errors during formation of index search conditions were not correctly checked, leading to incorrect query results. (Bug #22344)
- Indexes disabled with `ALTER TABLE ... DISABLE KEYS` could in some cases be used by specifying `FORCE INDEX`. (Bug #20604)
- `ALTER TABLE` caused loss of `CASCADE` clauses for `InnoDB` tables. (Bug #24741)

- Inserting `DEFAULT` into a column with no default value could result in garbage in the column. Now the same result occurs as when inserting `NULL` into a `NOT NULL` column. (Bug #20691)
- `LOAD DATA INFILE` did not work with pipes. (Bug #25807)
- `ALTER TABLE ... ENABLE KEYS` acquired a global lock, preventing concurrent execution of other statements that use tables. . (Bug #25044)
- An `AFTER UPDATE` trigger on an `InnoDB` table with a composite primary key caused the server to crash. (Bug #25398)
- Collation for `LEFT JOIN` comparisons could be evaluated incorrectly, leading to improper query results. (Bug #26017)
- `OPTIMIZE TABLE` caused a race condition in the I/O cache. (Bug #25042)
- Queries that evaluate `NULL IN (SELECT ... UNION SELECT ...)` could produce an incorrect result (`FALSE` instead of `NULL`). (Bug #24085)
- An error in the name resolution of nested `JOIN ... USING` constructs was corrected. (Bug #25575)
- Passing a `NULL` value to a user-defined function from within a stored procedure crashes the server. (Bug #25382)
- yaSSL was sensitive to the presence of whitespace at the ends of lines in PEM-encoded certificates, causing a server crash. (Bug #25189)
- `mysql_kill()` caused a server crash when used on an SSL connection. (Bug #25203)
- Within a stored routine, accessing a declared routine variable with `PROCEDURE ANALYSE()` caused a server crash. (Bug #23782)
- For the `IF()` [947] and `COALESCE()` [941] function and `CASE` [946] expressions, large unsigned integer values could be mishandled and result in warnings. (Bug #22026)
- Storing values specified as hexadecimal values 64 or more bits long in `BIT(64)`, `BIGINT`, or `BIGINT UNSIGNED` columns did not raise any warning or error if the value was out of range. (Bug #22533)
- Within stored routines or prepared statements, inconsistent results occurred with multiple use of `INSERT ... SELECT ... ON DUPLICATE KEY UPDATE` when the `ON DUPLICATE KEY UPDATE` clause erroneously tried to assign a value to a column mentioned only in its `SELECT` part. (Bug #24491)
- A query that contained an `EXIST` subquery with a `UNION` over correlated and uncorrelated `SELECT` queries could cause the server to crash. (Bug #25219)
- Expressions of the form `(a, b) IN (SELECT c, d ...)` could produce incorrect results if `a`, `b`, or both were `NULL`. (Bug #24127)
- The number of `setsockopt()` calls performed for reads and writes to the network socket was reduced to decrease system call overhead. (Bug #22943)
- For `ALTER TABLE`, using `ORDER BY` *`expression`* could cause a server crash. Now the `ORDER BY` clause permits only column names to be specified as sort criteria (which was the only documented syntax, anyway). (Bug #24562)
- `mysql.server stop` timed out too quickly (35 seconds) waiting for the server to exit. Now it waits up to 15 minutes, to ensure that the server exits. (Bug #25341)
- Expressions of the form `(a, b) IN (SELECT a, MIN(b) FROM t GROUP BY a)` could produce incorrect results when column `a` of table `t` contained `NULL` values while column `b` did not. (Bug #24420)

- A `WHERE` clause that used `BETWEEN` [941] for `DATETIME` values could be treated differently for a `SELECT` and a view defined as that `SELECT`. (Bug #26124)
- A nested query on a partitioned table returned fewer records than on the corresponding nonpartitioned table, when the subquery affected more than one partition. (Bug #24186)
- The `--with-readline` option for `configure` did not work for commercial source packages, but no error message was printed to that effect. Now a message is printed. (Bug #25530)
- `perror` crashed on some platforms due to failure to handle a `NULL` pointer. (Bug #25344)
- Certain joins using `Range checked for each record` in the query execution plan could cause the server to crash. (Bug #24776)
- The `readline` library wrote to uninitialized memory, causing `mysql` to crash. (Bug #19474)
- The optimizer used a filesort rather than a `const` [696] table read in some cases when the latter was possible. (Bug #16590)
- If a duplicate key value was present in the table, `INSERT ... ON DUPLICATE KEY UPDATE` reported a row count indicating that a record was updated, even when no record actually changed due to the old and new values being the same. Now it reports a row count of zero. (Bug #19978)

  References: See also Bug #27006, Bug #27033, Bug #27210.
- To enable installation of MySQL RPMs on Linux systems running RHEL 4 (which includes SE-Linux) additional information was provided to specify some actions that are permitted to the MySQL binaries. (Bug #12676)
- Use of already freed memory caused SSL connections to hang forever. (Bug #19209)
- `ORDER BY` values of the `DOUBLE` or `DECIMAL` types could change the result returned by a query. (Bug #19690)
- The server might fail to use an appropriate index for `DELETE` when `ORDER BY`, `LIMIT`, and a nonrestricting `WHERE` are present. (Bug #17711)
- The presence of `ORDER BY` in a view definition prevented the `MERGE` algorithm from being used to resolve the view even if nothing else in the definition required the `TEMPTABLE` algorithm. (Bug #12122)
- `CONNECTION` is no longer treated as a reserved word. (Bug #12204)

Changes in MySQL 5.1.15 (2007-01-25)

This is a new Beta development release, fixing recently discovered bugs.

Note

This Beta release, as any other pre-production release, should not be installed on *production* level systems or systems with critical data. It is good practice to back up your data before installing any new version of software. Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at http://bugs.mysql.com/ for more details about the individual bugs fixed in this version.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details, please see http://www.mysql.com/products/enterprise.

Functionality Added or Changed

- **Incompatible Change**: **MySQL Cluster**: The `LockPagesInMainMemory` [1832] configuration parameter has changed its type and possible values.

  Important

  The values `true` and `false` are no longer accepted for this parameter. If you were using this parameter and had it set to `false` in a previous release, you must change it to `0`. If you had this parameter set to `true`, you should instead use `1` to obtain the same behavior as previously, or `2` to take advantage of new functionality introduced with this release, as described in the section cited above.

  (Bug #25686)

- **Incompatible Change**: Previously, the `DATE_FORMAT()` [985] function returned a binary string. Now it returns a string with a character set and collation given by `character_set_connection` [464] and `collation_connection` [466] so that it can return month and weekday names containing non-ASCII characters. (Bug #22646)

- **Incompatible Change**: The following conditions apply to enabling the `read_only` [517] system variable:

  - If you attempt to enable `read_only` [517] while you have any explicit locks (acquired with `LOCK TABLES` or have a pending transaction, an error will occur.

  - If other clients hold explicit table locks or have pending transactions, the attempt to enable `read_only` [517] blocks until the locks are released and the transactions end. While the attempt to enable `read_only` [517] is pending, requests by other clients for table locks or to begin transactions also block until `read_only` [517] has been set.

  - `read_only` [517] can be enabled while you hold a global read lock (acquired with `FLUSH TABLES WITH READ LOCK`) because that does not involve table locks.

  Previously, the attempt to enable `read_only` [517] would return immediately even if explicit locks or transactions were pending, so some data changes could occur for statements executing in the server at the same time. (Bug #22009, Bug #11733)

- **Incompatible Change**: `InnoDB` rolls back only the last statement on a transaction timeout. A new option, `--innodb_rollback_on_timeout` [1380], causes `InnoDB` to abort and roll back the entire transaction if a transaction timeout occurs (the same behavior as in MySQL 5.0.13 and earlier). (Bug #24200)

- **Incompatible Change**: Previously, the `ARCHIVE` storage engine created a metadata file with an extension of `.ARM` for each table. The engine no longer creates this file.

- **Important Change**: Previously, duplicate-key errors were indicated by the `ER_DUP_ENTRY` [3960] error code (1062). This code is no longer used. Instead, the server returns `ER_DUP_ENTRY_WITH_KEY_NAME` [3994] (1582), and the error message indicates the name of the index for which the duplicate occurred. Applications that test for duplicate keys should look for both error codes if they need to be compatible with current and older servers.

  References: See also Bug #28842.

- **Important Change**: When using a `MERGE` table, the definition of the table and the underlying `MyISAM` tables are checked each time the tables are opened for access (including any `SELECT` or `INSERT` statement). Each table is compared for column order, types, sizes, and associated indexes. If there is a difference in any one of the tables, the statement will fail.

- **MySQL Cluster**: The `NDB` storage engine could leak memory during file operations. (Bug #21858)

- **Replication**: Calling a nondeterministic stored routine when using statement-based replication now throws an error. Formerly, defining such a stored routine would cause an error to be thrown. (Bug #16456)
- The `Com_create_user` status variable was added (for counting `CREATE USER` statements). (Bug #22958)
- The `--memlock` [435] option relies on system calls that are unreliable on some operating systems. If a crash occurs, the server now checks whether `--memlock` [435] was specified and if so issues some information about possible workarounds. (Bug #22860)
- On Unix, when searching the standard locations for option files, MySQL programs now also look for `/etc/mysql/my.cnf` after checking for `/etc/my.cnf` and before checking the remaining locations. (Bug #25104)
- Partitioning of tables using the `FEDERATED` storage engine is no longer permitted. Attempting to create such a table or to modify an existing table so that is uses both partitioning and `FEDERATED` now fails with an error. (Bug #22451)
- The default value of the `max_connections` [493] variable has been increased to 151 so that Web sites running on Apache and using MySQL will not have more processes trying to access MySQL than the default number of connections available.

  The maximum number of Apache processes is determined by the Apache `MaxClient` setting, which defaults to 256, but is usually set to 150 in the `httpd.conf` commonly distributed with Apache. For more information about `MaxClient`, see http://httpd.apache.org/docs/2.2/mod/mpm_common.html#maxclients. (Bug #23883)
- The (undocumented) `UNIQUE_USERS()` and `GROUP_UNIQUE_USERS()` functions were removed. (Bug #22687)
- The `--skip-thread-priority` [445] option now is enabled by default for binary Mac OS X distributions. Use of thread priorities degrades performance on Mac OS X. (Bug #18526)
- Added the `--disable-grant-options` [136] option to `configure`. If `configure` is run with this option, the `--bootstrap` [421], `--skip-grant-tables` [443], and `--init-file` [429] options for `mysqld` are disabled and cannot be used. For Windows, the `configure.js` script recognizes the `DISABLE_GRANT_OPTIONS` flag, which has the same effect.
- Remote servers for use with the `FEDERATED` storage engine now can be managed with the new `CREATE/ALTER/DROP SERVER` syntax.
- The bundled yaSSL library was upgraded to version 1.5.0.

Bugs Fixed

- **Incompatible Change**: For `ENUM` columns that had enumeration values containing commas, the commas were mapped to `0xff` internally. However, this rendered the commas indistinguishable from true `0xff` characters in the values. This no longer occurs. However, the fix requires that you dump and reload any tables that have `ENUM` columns containing any true `0xff` values. Dump the tables using `mysqldump` with the current server before upgrading from a version of MySQL 5.1 older than 5.1.15 to version 5.1.15 or newer. (Bug #24660)
- **Partitioning**: **MySQL Cluster**: Non-32-bit, nonaligned columns were not handled correctly in explicitly partitioned `NDB` tables. (Bug #25587)
- **MySQL Cluster**: **Replication**: (Replication): Connecting a `mysqld` to a cluster where not all nodes were running, starting the remaining cluster nodes, and then disconnecting from the cluster caused the `mysqld` process to crash. (Bug #25387)
- **MySQL Cluster**: The management server did not handle logging of node shutdown events correctly in certain cases. (Bug #22013)

- **MySQL Cluster**: `ndb_config` failed when trying to use 2 management servers and node IDs. (Bug #23887)
- **MySQL Cluster**: In some circumstances, shutting down the cluster could cause connected `mysqld` processes to crash. (Bug #25668)
- **MySQL Cluster**: When a data node was shut down using the management client `STOP` command, a connection event (`NDB_LE_Connected`) was logged instead of a disconnection event (`NDB_LE_Disconnected`). (Bug #22773)
- **MySQL Cluster**: It was not possible to create an `NDB` table with a key on two `VARCHAR` columns where both columns had a storage length in excess of 256. (Bug #25746)
- **MySQL Cluster**: A node shutdown occurred if the master failed during a commit. (Bug #25364)
- **MySQL Cluster**: Memory allocations for `TEXT` columns were calculated incorrectly, resulting in space being wasted and other issues. (Bug #25562)
- **MySQL Cluster**: The failure of a node during a local checkpoint could lead to other node failures. (Bug #25468)
- **MySQL Cluster**: Creating a nonunique index with the `USING HASH` clause silently created an ordered index instead of issuing a warning. (Bug #24820)
- **MySQL Cluster**: Hosts in clusters with large numbers of nodes could experience excessive CPU usage while obtaining configuration data. (Bug #25711)
- **MySQL Cluster**: The failure of a master node during a node restart could lead to a resource leak, causing later node failures. (Bug #25554)
- **MySQL Cluster**: Some aggregate queries such as `SELECT COUNT(*)` performed a table scan on `NDB` tables rather than checking table statistics, causing such queries to perform much more slowly in MySQL Cluster 5.1 than in 5.0. (Bug #25567)
- **MySQL Cluster**: When stopping and restarting multiple data nodes, the last node to be restarted would sometimes hang in Phase 100. (Bug #19645)
- **MySQL Cluster**: `SELECT` statements with a `BLOB` or `TEXT` column in the selected column list and a `WHERE` condition including a primary key lookup on a `VARCHAR` primary key produced empty result sets. (Bug #19956)
- **Replication**: A stored procedure, executed from a connection using a binary character set, and which wrote multi-byte data, would write incorrectly escaped entries to the binary log. This caused syntax errors, and caused replication to fail. (Bug #23619, Bug #24492)
- **Replication**: Changes to the `lc_time_names` [487] system variable were not replicated. (Bug #22645)
- **Replication**: Using `CREATE TABLE ... SELECT` and rolling back the transaction would leave an empty table on the master, but the instructions would not be recorded in the binary log and therefore replicated to the slave. This would result in a difference between the master and slave databases. An implicit commit has been added to ensure consistency. (Bug #22865)
- **Replication**: When `SET PASSWORD` was written to the binary log, double quotation marks were included in the statement. If the slave was running in with the server SQL mode set to `ANSI_QUOTES` [572], then the event failed, which halted the replication process. (Bug #24158)
- **Replication**: Using row-based replication to replicate to a table having at least one extra `BIT` column with a default value on the slave as compared to the master could cause the slave to fail. (Bug #24490)
- **Replication**: For `SET`, `SELECT`, and `DO` statements that invoked a stored function from a database other than the default database, the function invocation could fail to be replicated. (Bug #19725)

- **Disk Data**: `MEDIUMTEXT` columns of Disk Data tables were stored in memory rather than on disk, even if the columns were not indexed. (Bug #25001)
- **Disk Data**: Changing a column specification or issuing a `TRUNCATE TABLE` statement on a Disk Data table caused the table to become an in-memory table. (Bug #24667, Bug #25296)
- **Disk Data**: Following three or more missed local checkpoints by a cluster node, a restart of the node caused incorrect undo information to be used for Disk Data tables. (Bug #25636)
- **Disk Data**: When restoring from backup a cluster containing any Disk Data tables with hidden primary keys, a node failure resulted which could lead to a crash of the cluster. (Bug #24166)
- **Disk Data**: Repeated `CREATE`, `DROP`, or `TRUNCATE TABLE` in various combinations with system restarts between these operations could lead to the eventual failure of a system restart. (Bug #21948)
- **Disk Data**: Performing a node restart with a newly dropped Disk Data table could lead to failure of the node during the restart. (Bug #24917)
- **Disk Data**: Extents that should have been available for re-use following a `DROP TABLE` operation were not actually made available again until after the cluster had performed a local checkpoint. (Bug #17605)
- **Cluster Replication**: Certain errors in replication setups could lead to unexpected node failures. (Bug #25755)
- **Cluster Replication**: Following a restart of the master cluster, the latest GCI was set to 0 upon reconnection to the slave. (Bug #21806)
- **Cluster Replication**: Connecting an API node to the cluster during a node restart while performing database operations could cause the restarting node to fail. (Bug #25329)
- **Cluster API**: A unique index lookup on a nonexistent tuple could lead to a data node timeout (error 4012). (Bug #25059)
- **Cluster API**: Invoking the `NdbTransaction::execute()` method using execution type `Commit` and abort option `AO_IgnoreError` could lead to a crash of the transaction coordinator (`DBTC`). (Bug #25090)
- **Cluster API**: When using the `NdbTransaction::execute()` method, a very long timeout (greater than 5 minutes) could result if the last data node being polled was disconnected from the cluster. (Bug #24949)
- **Cluster API**: Due to an error in the computation of table fragment arrays, some transactions were not executed from the correct starting point. (Bug #24914)
- **Cluster API**: Deletion of an `Ndb_cluster_connection` object took a very long time. (Bug #25487)
- When opening a corrupted `.frm` file during a query, the server crashes. (Bug #24358)
- SSL connections could hang at connection shutdown. (Bug #21781, Bug #24148)
- A partitioned table that used the `DATA DIRECTORY` option, where the data directory was the same as the directory in which the table definition file resided, became corrupted following `ALTER TABLE ENGINE=ARCHIVE`. This was actually due to an issue with the `ARCHIVE` storage engine, and not with partitioned tables in general. (Bug #22634)
- A multiple-table `DELETE QUICK` could sometimes cause one of the affected tables to become corrupted. (Bug #25048)
- `mysqltest_embedded` crashed at startup. (Bug #25890)
- Under some circumstances, a `REORGANIZE PARTITION` statement could crash `mysqld`. (Bug #24502)

- `SET lc_time_names = value` permitted only exact literal values, not expression values. (Bug #22647)
- If there was insufficient memory to store or update a blob record in a `MyISAM` table then the table will marked as crashed. (Bug #23196)
- A server crash occurred when using `LOAD DATA` to load a table containing a `NOT NULL` spatial column, when the statement did not load the spatial column. Now a `NULL supplied to NOT NULL column` error occurs. (Bug #22372)
- `mysql_upgrade` failed if the `--password` (or `-p`) option was given. (Bug #24896)
- Accessing a fixed record format table with a crashed key definition results in server/`myisamchk` segmentation fault. (Bug #24855)
- The row count for `MyISAM` tables was not updated properly, causing `SHOW TABLE STATUS` to report incorrect values. (Bug #23526)
- An assertion failed incorrectly for prepared statements that contained a single-row uncorrelated subquery that was used as an argument of the `IS NULL` [940] predicate. (Bug #25027)
- When updating a table that used a `JOIN` of the table itself (for example, when building trees) and the table was modified on one side of the expression, the table would either be reported as crashed or the wrong rows in the table would be updated. (Bug #21310)
- Referencing an ambiguous column alias in an expression in the `ORDER BY` clause of a query caused the server to crash. (Bug #25427)
- The `STDDEV()` [1047] function returned a positive value for data sets consisting of a single value. (Bug #22555)
- A view was not handled correctly if the `SELECT` part contained "`\Z`". (Bug #24293)
- `SHOW COLUMNS` reported some `NOT NULL` columns as `NULL`. (Bug #22377)
- `STR_TO_DATE()` [991] returned `NULL` if the format string contained a space following a nonformat character. (Bug #22029)
- A number of issues were uncovered by Valgrind. (Bug #25396)
- `mysql_fix_privilege_tables.sql` altered the `table_privs.table_priv` column to contain too few privileges, causing loss of the `CREATE VIEW` and `SHOW VIEW` [628] privileges. (Bug #20589)
- `OPTIMIZE TABLE` tried to sort R-tree indexes such as spatial indexes, although this is not possible (see `OPTIMIZE TABLE` Syntax). (Bug #23578)
- In the `INFORMATION_SCHEMA.KEY_COLUMN_USAGE` table, the value displayed for the `REFERENCED_TABLE_NAME` column was the table name as encoded for disk storage, not the actual table name. (Bug #25026)
- `InnoDB` crashed while performing XA recovery of prepared transactions. (Bug #21468)
- Some joins in which one of the joined tables was a view could return erroneous results or crash the server. (Bug #24345)
- yaSSL crashed on pre-Pentium Intel CPUs. (Bug #21765)
- The `REPEAT()` [955] function could return `NULL` when passed a column for the count argument. (Bug #24947)
- It was possible to use `DATETIME` values whose year, month, and day parts were all zeros but whose hour, minute, and second parts contained nonzero values, an example of such an illegal `DATETIME` being `'0000-00-00 11:23:45'`.

Note

This fix was reverted in MySQL 5.1.18.

(Bug #21789)

References: See also Bug #25301.

- A query using `WHERE unsigned_column NOT IN ('negative_value')` could cause the server to crash. (Bug #24261)
- Using a view in combination with a `USING` clause caused column aliases to be ignored. (Bug #25106)
- The code for generating `USE` statements for binary logging of `CREATE PROCEDURE` statements resulted in confusing output from `mysqlbinlog` for `DROP PROCEDURE` statements. (Bug #22043)
- Selecting into variables sometimes returned incorrect wrong results. (Bug #20836)
- A deadlock could occur, with the server hanging on `Closing tables`, with a sufficient number of concurrent `INSERT DELAYED`, `FLUSH TABLES`, and `ALTER TABLE` operations. (Bug #23312)
- When reading from the standard input on Windows, `mysqlbinlog` opened the input in text mode rather than binary mode and consequently misinterpreted some characters such as **Control+Z**. (Bug #23735)
- A `FETCH` statement using a cursor on a table which was not in the table cache could sometimes cause the server to crash. (Bug #24117)
- A crash of the MySQL Server could occur when unpacking a `BLOB` column from a row in a corrupted MyISAM table. This could happen when trying to repair a table using either `REPAIR TABLE` or `myisamchk`; it could also happen when trying to access such a “broken” row using statements like `SELECT` if the table was not marked as crashed. (Bug #22053)
- It was possible to set the backslash character (“`\`”) as the delimiter character using `DELIMITER`, but not actually possible to use it as the delimiter. (Bug #21412)
- Some small double precision numbers (such as `1.00000001e-300`) that should have been accepted were truncated to zero. (Bug #22129)
- `mysqld_multi` and `mysqlaccess` looked for option files in `/etc` even if the `--sysconfdir` option for `configure` had been given to specify a different directory. (Bug #24780)
- A compressed `MyISAM` table that became corrupted could crash `myisamchk` and possibly the MySQL Server. (Bug #23139)
- `DATE_ADD()` [983] requires complete dates with no “zero” parts, but sometimes did not return `NULL` when given such a date. (Bug #22229)
- The `--extern` option for `mysql-test-run.pl` did not function correctly. (Bug #24354)
- `mysql_upgrade` failed when called with a `--basedir` [256] path name containing spaces. (Bug #22801)
- If there was insufficient memory available to `mysqld`, this could sometimes cause the server to hang during startup. (Bug #24751)
- `mysqld_error.h` was not installed when only the client libraries were built. (Bug #21265)
- `CREATE TABLE ... SELECT` statements were not rolled back correctly. As part of the fix, such a statement now causes an implicit commit before and after it is executed. However, it does not cause a commit when used to create a temporary table. (Bug #22864)

- Attempts to access a MyISAM table with a corrupt column definition caused a server crash. (Bug #24401)
- The Instance Manager DROP INSTANCE command did not work. (Bug #23476)
- Queries of the form SELECT ... WHERE *string* = ANY(...) failed when the server used a single-byte character set and the client used a multi-byte character set. (Bug #20835)

  References: See also Bug #34760.
- On HP-UX, mysqltest (nonthread-safe) crashed due to being linked against a thread-safe libmysys library. (Bug #23984)
- Using INSTALL PLUGIN followed by a restart of the server caused an error due to memory not being properly initialized. (Bug #22694)
- Accuracy was improved for comparisons between DECIMAL columns and numbers represented as strings. (Bug #23260)
- Optimizations that are legal only for subqueries without tables and WHERE conditions were applied for any subquery without tables. (Bug #24670)
- mysqltest crashed with a stack overflow. (Bug #24498)
- ALTER TABLE statements that performed both RENAME TO and {ENABLE|DISABLE} KEYS operations caused a server crash. (Bug #24219)
- Under certain rare circumstances, local checkpoints were not performed properly, leading to an inability to restart one or more data nodes. (Bug #24664)
- The MySQL 5.1.12 binaries for Windows were missing the FEDERATED, EXAMPLE, and BLACKHOLE storage engines. (Bug #23900)
- An ALTER TABLE statement that used a RENAME clause in combination with a MODIFY or CHANGE that did not actually change the table (for example, when it changed a column's type from INT to INT). The behavior caused by this bug differed according to whether or not the storage engine used by the table was transactional or nontransactional. For transactional tables (such as those using the InnoDB storage engine), the statement simply failed; for nontransactional tables (such as those using the MyISAM storage engine), the ALTER TABLE statement succeeding renaming the table, but subsequent SELECT statements against the renamed table would fail. (Bug #22369)
- The mysql.server script used the source command, which is less portable than the . command; it now uses . instead. (Bug #24294)
- Using ALTER TABLE to convert a CSV table containing NULL values to MyISAM resulted in warnings. (Bug #21328)
- The Instance Manager STOP INSTANCE command took too much time and caused Instance Manager to be unresponsive. (Bug #23215)
- Changing the value of MI_KEY_BLOCK_LENGTH in myisam.h and recompiling MySQL resulted in a myisamchk that saw existing MyISAM tables as corrupt. (Bug #22119)
- Hebrew-to-Unicode conversion failed for some characters. Definitions for the following Hebrew characters (as specified by the ISO/IEC 8859-8:1999) were added: LEFT-TO-RIGHT MARK (LRM), RIGHT-TO-LEFT MARK (RLM) (Bug #24037)
- User-defined variables could consume excess memory, leading to a crash caused by the exhaustion of resources available to the MEMORY storage engine, due to the fact that this engine is used by MySQL for variable storage and intermediate results of GROUP BY queries. Where SET had been used, such a condition could instead give rise to the misleading error message `You may only use constant expressions with SET`, rather than `Out of memory (Needed NNNNNN bytes)`. (Bug #23443)

- A table created with the `ROW_FORMAT = FIXED` table option lost that option if an index was added or dropped with `CREATE INDEX` or `DROP INDEX`. (Bug #23404)
- `InnoDB`: During a restart of the MySQL Server that followed the creation of a temporary table using the `InnoDB` storage engine, MySQL failed to clean up in such a way that `InnoDB` still attempted to find the files associated with such tables. (Bug #20867)
- A workaround was implemented to avoid a race condition in the NPTL `pthread_exit()` implementation. (Bug #24507)
- The Instance Manager `STOP INSTANCE` command could not be applied to instances in the `Crashed`, `Failed`, or `Abandoned` state. (Bug #22306)
- Using `FLUSH TABLES` in one connection while another connection is using `HANDLER` statements caused a server crash.

  Note

  This fix was reverted in MySQL 5.1.22

  (Bug #21587)

  References: See also Bug #29474.
- `ROW_COUNT()` [1038] did not work properly as an argument to a stored procedure. (Bug #23760)
- `mysql_install_db` did not create the `mysql.plugin` table if strict SQL mode was enabled. (Bug #24270)
- The server was built even when `configure` was run with the `--without-server` [133] option. (Bug #23973)

  References: See also Bug #32898.
- `ALTER TABLE ENABLE KEYS` or `ALTER TABLE DISABLE KEYS` combined with another `ALTER TABLE` option other than `RENAME TO` did nothing. In addition, if `ALTER TABLE` was used on a table having disabled keys, the keys of the resulting table were enabled. (Bug #24395)
- For a nonexistent table, `DROP TEMPORARY TABLE` failed with an incorrect error message if `read_only` [517] was enabled. (Bug #22077)
- The `FEDERATED` storage engine did not support the `euckr` character set. (Bug #21556)
- Dropping a user-defined function sometimes did not remove the UDF entry from the `mysql.proc` table. (Bug #15439)
- `mysql_fix_privilege_tables` did not accept a password containing embedded space or apostrophe characters. (Bug #17700)
- The `BUILD/check-cpu` script did not recognize Celeron processors. (Bug #20061)
- `FLUSH LOGS` or `mysqladmin flush-logs` caused a server crash if the binary log was not open. (Bug #17733)
- Some `CASE` statements inside stored routines could lead to excessive resource usage or a crash of the server. (Bug #19194, Bug #24854)
- No warning was issued for use of the `DATA DIRECTORY` or `INDEX DIRECTORY` table options on a platform that does not support them. (Bug #17498)
- `SELECT ... FOR UPDATE`, `SELECT ... LOCK IN SHARE MODE`, `DELETE`, and `UPDATE` statements executed using a full table scan were not releasing locks on rows that did not satisfy the `WHERE` condition. (Bug #20390)

- `mysqldump --order-by-primary` failed if the primary key name was an identifier that required quoting. (Bug #13926)
- Inserting a row into a table without specifying a value for a `BINARY(N) NOT NULL` column caused the column to be set to spaces, not zeros. (Bug #14171)
- The `FEDERATED` storage engine did not support the `utf8` character set. (Bug #17044)
- When a prepared statement failed during the prepare operation, the error code was not cleared when it was reused, even if the subsequent use was successful. (Bug #15518)
- `VARBINARY` column values inserted on a MySQL 4.1 server had trailing zeros following upgrade to MySQL 5.0 or later. (Bug #19371)
- The `DELIMITER` statement did not work correctly when used in an SQL file run using the `SOURCE` statement. (Bug #19799)
- `mysqltest` incorrectly tried to retrieve result sets for some queries where no result set was available. (Bug #19410)
- `myisampack` wrote to unallocated memory, causing a crash. (Bug #17951)
- The optimizer removes expressions from `GROUP BY` and `DISTINCT` clauses if they happen to participate in *`expression = constant`* predicates of the `WHERE` clause, the idea being that, if the expression is equal to a constant, then it cannot take on multiple values. However, for predicates where the expression and the constant item are of different result types (for example, when a string column is compared to 0), this is not valid, and can lead to invalid results in such cases. The optimizer now performs an additional check of the result types of the expression and the constant; if their types differ, then the expression is not removed from the `GROUP BY` list. (Bug #15881)
- Instance Manager could crash during shutdown. (Bug #19044)
- On Windows, the `SLEEP()` [1042] function could sleep too long, especially after a change to the system clock. (Bug #14094, Bug #24686, Bug #17635)
- A stored routine containing semicolon in its body could not be reloaded from a dump of a binary log. (Bug #20396)
- Unsigned `BIGINT` values treated as signed values by the `MOD()` [975] function. (Bug #19955)
- Compiling PHP 5.1 with the MySQL static libraries failed on some versions of Linux. (Bug #19817)
- Subqueries of the form `NULL IN (SELECT ...)` returned invalid results. (Bug #8804, Bug #23485)

Changes in MySQL 5.1.14 (2006-12-05)

This is a new Beta development release, fixing recently discovered bugs.

Note

This Beta release, as any other pre-production release, should not be installed on *production* level systems or systems with critical data. It is good practice to back up your data before installing any new version of software. Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at http://bugs.mysql.com/ for more details about the individual bugs fixed in this version.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that

are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details, please see http://www.mysql.com/products/enterprise.

Functionality Added or Changed

- **Cluster Replication**: **Incompatible Change**: Two major changes have taken place with regard to the MySQL Cluster system tables. These are:

  1. The `cluster` database is no longer used. The tables formerly found in the `cluster` database are now in the `mysql` database, and have been renamed as `ndb_binlog_index`, `ndb_apply_status`, and `ndb_schema`.

  2. The `mysql.ndb_apply_status` and `mysql.ndb_schema` tables (formerly `cluster.apply_status` and `cluster.schema` are now created by `ndb_restore`, in the event that they do not already exist on the slave cluster.

  Note

  When upgrading from versions of MySQL previous to 5.1.14 to 5.1.14 or later, `mysql_fix_privilege_tables` merely creates a new `mysql.ndb_binlog_index` table, but does not remove the existing `cluster` database (or, if upgrading from MySQL 5.1.7 or earlier, the existing `cluster_replication` database), nor any of the tables in it.

  For more information, see MySQL Cluster Replication Schema and Tables. (Bug #14612)

- **Cluster Replication**: **Incompatible Change**: The `cluster` database is no longer used. The tables formerly found in the `cluster` database are now in the `mysql` database, and have been renamed as `ndb_binlog_index`, `ndb_apply_status`, and `ndb_schema`.

- **Incompatible Change**: The `prepared_stmt_count` [511] system variable has been converted to the `Prepared_stmt_count` [566] global status variable (viewable with the `SHOW GLOBAL STATUS` statement). (Bug #23159)

- **Incompatible Change**: Previously, you could create a user-defined function (UDF) or stored function with the same name as a built-in function, but could not invoke the UDF. Now an error occurs if you try to create such a UDF. The server also now generates a warning if you create a stored function with the same name as a built-in function. It is not considered an error to create a stored function with the same name as a built-in function because you can invoke the function using *`db_name.func_name()`* syntax. However, the server now generates a warning in this case.

  See Function Name Parsing and Resolution, for the rules describing how the server interprets references to different kinds of functions. (Bug #22619, Bug #18239)

- **Disk Data**: **Important Change**: The output of `mysqldump` now includes by default all tablespace and logfile group definitions used by any tables or databases that are dumped.

  This fix also introduces the `--no-tablespaces` [299] option (short form: `-y`) for `mysqldump`, which has the effect of suppressing all `CREATE LOGFILE GROUP` and `CREATE TABLESPACE` statements in the output.

  Note

  The working of the `--all-tablespaces` [294] or `-Y` option for `mysqldump` remains unaffected by this change.

  (Bug #20839)

- **MySQL Cluster**: Setting the configuration parameter `LockPagesInMainMemory` [1832] had no effect. (Bug #24461)

- **MySQL Cluster**: Backup messages are now printed to the Cluster log. (Bug #24544)

- **MySQL Cluster**: The error message `Management server closed connection`, when recorded in the MySQL error log, now includes a timestamp indicating when the error took place. (Bug #21519)

- **MySQL Cluster**: It is now possible to create a unique hashed index on a column that is not defined as `NOT NULL`.

  Note

  This change applies only to tables using the `NDB` storage engine.

  Unique indexes on columns in `NDB` tables do not store null values because they are mapped to primary keys in an internal index table (and primary keys cannot contain nulls).

  Normally, an additional ordered index is created when one creates unique indexes on `NDB` table columns; this can be used to search for `NULL` values. However, if `USING HASH` is specified when such an index is created, no ordered index is created.

  The reason for permitting unique hash indexes with null values is that, in some cases, the user wants to save space if a large number of records are pre-allocated but not fully initialized. This also assumes that the user will *not* try to search for null values. Since MySQL does not support indexes that are not permitted to be searched in some cases, the `NDB` storage engine uses a full table scan with pushed conditions for the referenced index columns to return the correct result.

  A warning is returned if one creates a unique nullable hash index, since the query optimizer should be provided a hint not to use it with `NULL` values if this can be avoided. (Bug #21507)

- The XPath operators `<` and `>`, as implemented in the `ExtractValue()` [1016] function, operated in reverse.

  With this fix, all standard XPath comparison operators should now be supported correctly for use with the `ExtractValue()` [1016] and `UpdateXML()` [1018] functions. (Bug #22823)

- Direct and indirect usage of stored routines, user-defined functions, and table references is now prohibited in `CREATE EVENT` and `ALTER EVENT` statements.

  See `CREATE EVENT` Syntax, and `ALTER EVENT` Syntax, for more specific information. (Bug #22830)

- `DROP TRIGGER` now supports an `IF EXISTS` clause. (Bug #23703)

- `mysqladmin`, `mysqlcheck`, `mysqldump`, `mysqlimport`, and `mysqlshow` now accept the `--debug-info` option, which displays debugging information and memory and CPU usage statistics at program exit.

- For the `mysql` client, display of result set metadata now is enabled with the `--column-type-info` [261] option rather than with `--debug-info` [261]/`-T`.

Bugs Fixed

- **Performance**: Evaluation of subqueries that require the filesort algorithm were allocating and freeing the `sort_buffer_size` [523] buffer many times, resulting in slow performance. Now the buffer is allocated once and reused. (Bug #21727)

- **MySQL Cluster**: **Replication**: (Replication): If errors occurred during purging of the binary logs, extraneous rows could remain left in the `binlog_index` table. (Bug #15021)

- **MySQL Cluster**: Sudden disconnection of an SQL or data node could lead to shutdown of data nodes with the error `failed ndbrequire`. (Bug #24447)

- **MySQL Cluster**: It was possible for the sum of the `MaxNoOfTables` [1829], `MaxNoOfOrderedIndexes` [1829], and `MaxNoOfUniqueHashIndexes` [1830] configuration

parameters, plus the number of system tables to exceed the maximum value for a `Uint32` number. In such a case, the cluster's data nodes failed to start, and no reason for this could easily be determined from the error messages provided. (Bug #22548)

- **MySQL Cluster**: The simultaneous shutdown of `mysqld` and `ndbd` processes caused unnecessary locking. (Bug #24655)
- **MySQL Cluster**: Given a table `mytbl` in a database `mydb` on a MySQL Server acting as an SQL node in a MySQL Cluster, then, following multiple `ALTER TABLE mytbl ENGINE=engine` statements—first, to change the storage engine used for a table to `NDB`, and then again to change the table to use a non-`NDB` storage engine—a `DROP DATABASE mydb` statement executed on any SQL node in the cluster would cause `mydb` to be dropped on *all* SQL nodes in the cluster, even if `mydb` contained non-`NDB` tables. (Bug #21495)
- **MySQL Cluster**: (Disk Data): Under some circumstances, a `DELETE` from a Disk Data table could cause `mysqld` to crash. (Bug #23542)
- **MySQL Cluster**: (Disk Data): Excessive fragmentation of Disk Data files (including log files and data files) could occur during the course of normal use. (Bug #24143)
- **MySQL Cluster**: When the management client command `ALL RESTART -i` was executed while one data node was not running, all data nodes in the cluster were shut down. (Bug #24105)
- **MySQL Cluster**: Any statement following the execution of `CREATE TABLE ... LIKE ndb_table` (where `ndb_table` was a table using the `NDB` storage engine), would cause the `mysql` client to hang. (Bug #24301)
- **MySQL Cluster**: The failure of a data node failure during a schema operation could lead to additional node failures. (Bug #24752)
- **MySQL Cluster**: The failure of the master node in a node group during the allocation of node IDs could cause `ndb_mgmd` to hang. (Bug #24543)
- **MySQL Cluster**: A committed read could be attempted before a data node had time to connect, causing a timeout error. (Bug #24717)
- **MySQL Cluster**: A query using an index scan followed by a delete operation, and then a rollback could cause one or more data nodes to crash. (Bug #24039)
- **MySQL Cluster**: A value equal to or greater than the permitted maximum for `LongMessageBuffer` [1825] caused all data nodes to crash. (Bug #22547)
- **MySQL Cluster**: Multiple occurrences of error conditions were logged with duplicat error messages rather than being reported with a single error message stating that the error was encountered `N` times. (Bug #22313)
- **MySQL Cluster**: Creating a new tables containing a `BLOB` column when the server was short of memory could cause the server to crash. (Bug #24470)
- **MySQL Cluster**: In certain rare cases, a data node could crash due to a typographical error in the MySQL Cluster source code. (Bug #24476)
- **MySQL Cluster**: A unique constraint violation was not ignored by an `UPDATE IGNORE` statement when the constraint violation occurred on a nonprimary key. (Bug #18487, Bug #24303)
- **MySQL Cluster**: Different error messages were returned for similar cases involving failure to allocate memory for Cluster operations. (Bug #19203)
- **MySQL Cluster**: If the value set for `MaxNoOfAttributes` [1828] is excessive, a suitable error message is now returned. (Bug #19352)
- **MySQL Cluster**: An incorrect error message was displayed in the event that the value of the `DataMemory` [1817] parameter was insufficient for the amount of data to be stored by the cluster. (Bug #19808)

- **MySQL Cluster**: Some values of `MaxNoOfTriggers` [1830] could cause the server to become inaccessible following startup of the data nodes. (Bug #19454)
- **MySQL Cluster**: An incorrect error message was displayed in the event that the value of the `MaxNoOfOrderedIndexes` [1829] parameter was set too low. (Bug #20065)
- **Replication**: With row-based binary logging, replicated multiple-statement transaction deadlocks did not return the correct error code, causing the slave SQL thread to stop rather than roll back and re-execute. (Bug #23831)
- **Replication**: Changes to character set variables prior to an action on a replication-ignored table were forgotten by slave servers. (Bug #22877)
- **Replication**: On slave servers, transactions that exceeded the lock wait timeout failed to roll back properly. (Bug #20697)
- **Replication**: SQL statements close to the size of `max_allowed_packet` [493] could produce binary log events larger than `max_allowed_packet` [493] that could not be read by slave servers. (Bug #19402)
- **Disk Data**: `ndb_restore` sometimes failed when attempting to restore Disk Data tables due to data node failure caused by accessing uninitialized memory. (Bug #24331)
- **Disk Data**: It was possible to execute a statement for creating a Disk Data table that referred to a nonexistent tablespace, in which case the table created was actually an in-memory `NDB` table. Such a statement now fails instead, with an appropriate error message. (Bug #23576)
- **Cluster API**: Using `BIT` values with any of the comparison methods of the `NdbScanFilter` class caused data nodes to fail. (Bug #24503)
- **Cluster API**: Some MGM API function calls could yield incorrect return values in certain cases where the cluster was operating under a very high load, or experienced timeouts in inter-node communications. (Bug #24011)
- In some cases, the parser failed to distinguish a user-defined function from a stored function. (Bug #21809)
- `LAST_DAY('0000-00-00')` [988] could cause a server crash. (Bug #23653)
- If elements in a nontop-level `IN` subquery were accessed by an index and the subquery result set included a `NULL` value, the quantified predicate that contained the subquery was evaluated to `NULL` when it should return a non-`NULL` value. (Bug #23478)
- Inserting a default or invalid value into a spatial column could fail with `Unknown error` rather than a more appropriate error. (Bug #21790)
- `CREATE FUNCTION X()` and `CREATE FUNCTION Y()` failed with a syntax error instead of warning the user that these function names are already used (for GIS functions). (Bug #21025)
- With row-based binary logging, for `CREATE TABLE IF NOT EXISTS LIKE` *`temporary_table`* statements, the `IF NOT EXISTS` clause was not logged. (Bug #22762)
- For debug builds, `mysqladmin shutdown` displayed an extraneous `skipped 9 bytes from file: socket (3)` message. (Bug #21428)
- `CONCURRENT` did not work correctly for `LOAD DATA INFILE`. (Bug #20637)
- `INET_ATON()` [1041] returned a signed `BIGINT` value, not an unsigned value. (Bug #21466)
- The size of `MEMORY` tables and internal temporary tables was limited to 4GB on 64-bit Windows systems. (Bug #24052)
- When applying the `group_concat_max_len` [478] limit, `GROUP_CONCAT()` [1046] could truncate multi-byte characters in the middle. (Bug #23451)

- The loose index scan optimization for `GROUP BY` with `MIN` or `MAX` was not applied within other queries, such as `CREATE TABLE ... SELECT ...`, `INSERT ... SELECT ...`, or in the `FROM` clauses of subqueries. (Bug #24156)
- Trailing spaces were not removed from Unicode `CHAR` column values when used in indexes. This resulted in excessive usage of storage space, and could affect the results of some `ORDER BY` queries that made use of such indexes.

  Note

  When upgrading, it is necessary to re-create any existing indexes on Unicode `CHAR` columns of each affected table to take advantage of the fix. See Rebuilding or Repairing Tables or Indexes.

  (Bug #22052)
- With row-based binary logging, `CREATE TABLE IF NOT EXISTS SELECT` statements were not logged properly. (Bug #22027)
- Queries using a column alias in an expression as part of an `ORDER BY` clause failed, an example of such a query being `SELECT mycol + 1 AS mynum FROM mytable ORDER BY 30 - mynum`. (Bug #22457)
- Instance Manager option-parsing code caused memory-allocation errors. (Bug #22242)
- A trigger that invoked a stored function could cause a server crash when activated by different client connections. (Bug #23651)
- In some cases, a function that should be parsed as a user-defined function was parsed as a stored function. (Bug #24736)
- The stack size for NetWare binaries was increased to 128KB to prevent problems caused by insufficient stack size. (Bug #23504)
- Using `EXPLAIN` caused a server crash for queries that selected from `INFORMATION_SCHEMA` in a subquery in the `FROM` clause. (Bug #22413)
- Calculation of `COUNT(DISTINCT)` [1045], `AVG(DISTINCT)` [1045], or `SUM(DISTINCT)` [1047] when they are referenced more than once in a single query with `GROUP BY` could cause a server crash. (Bug #23184)
- Subqueries for which a pushed-down condition did not produce exactly one key field could cause a server crash. (Bug #24056)
- `BENCHMARK()` [1032], `ENCODE()` [1030], `DECODE()` [1029], and `FORMAT()` [952] could only accept a constant for some parameters, and could not be used in prepared statements. (Bug #22684)
- Through the C API, the member strings in `MYSQL_FIELD` for a query that contained expressions could return incorrect results. (Bug #21635)
- Some unnecessary Valgrind warnings were removed from the server. (Bug #24488, Bug #24533)
- The server source code had multiple exportable definitions of the `field_in_record_is_null()` function. These are now all declared `static`. (Bug #24190)
- For renaming of views, encoding of table name to file names was not performed. (Bug #21370)
- `mysql_affected_rows()` could return values different from `mysql_stmt_affected_rows()` for the same sequence of statements. (Bug #23383)
- View columns were always handled as having implicit derivation, leading to `illegal mix of collation errors` for some views in `UNION` operations. Now view column derivation comes from the original expression given in the view definition. (Bug #21505)

- Invalidating the query cache caused a server crash for `INSERT INTO ... SELECT` statements that selected from a view. (Bug #20045)
- For a cast of a `DATETIME` value containing microseconds to `DECIMAL`, the microseconds part was truncated without generating a warning. Now the microseconds part is preserved. (Bug #19491)
- The server could send incorrect column count information to the client for queries that produce a larger number of columns than can fit in a two-byte number. (Bug #19216)
- For queries that select from a view, the server returned `MYSQL_FIELD` metadata inconsistently for view names and table names. For view columns, the server now returns the view name in the `table` field and, if the column selects from an underlying table, the table name in the `org_table` field. (Bug #20191)
- For some problems relating to character set conversion or incorrect string values for `INSERT` or `UPDATE`, the server reported truncation or length errors instead. (Bug #18908)
- With `lower_case_table_names` [492] set to 1, `SHOW CREATE TABLE` printed incorrect output for table names containing Turkish I (LATIN CAPITAL LETTER I WITH DOT ABOVE). (Bug #20404)
- Attempting to use a view containing `DEFINER` information for a nonexistent user resulted in an error message that revealed the definer account. Now the definer is revealed only to users that have the `SUPER` [628] privilege. Other users receive only an `access denied` message. (Bug #17254)
- `IN()` [942] and `CHAR()` [950] can return `NULL`, but did not signal that to the query processor, causing incorrect results for `IS NULL` [940] operations. (Bug #17047)
- A query with a subquery that references columns of a view from the outer `SELECT` could return an incorrect result if used from a prepared statement. (Bug #20327)
- Constant expressions and some numeric constants used as input parameters to user-defined functions were not treated as constants. (Bug #18761)
- Warnings were generated when explicitly casting a character to a number (for example, `CAST('x' AS SIGNED)` [1012]), but not for implicit conversions in simple arithmetic operations (such as `'x' + 0`). Now warnings are generated in all cases. (Bug #11927)
- Metadata for columns calculated from scalar subqueries was limited to integer, double, or string, even if the actual type of the column was different. (Bug #11032)

Changes in MySQL 5.1.13 (Not released)

This is a new Beta development release, fixing recently discovered bugs.

Note

This Beta release, as any other pre-production release, should not be installed on *production* level systems or systems with critical data. It is good practice to back up your data before installing any new version of software. Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at http://bugs.mysql.com/ for more details about the individual bugs fixed in this version.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details, please see http://www.mysql.com/products/enterprise.

Functionality Added or Changed

- **Incompatible Change**: The number of function names affected by `IGNORE_SPACE` [573] was reduced significantly in MySQL 5.1.13, from about 200 to about 30. (For details about

IGNORE_SPACE [573], see Function Name Parsing and Resolution.) This change improves the consistency of parser operation. However, it also introduces the possibility of incompatibility for old SQL code that relies on the following conditions:

- IGNORE_SPACE [573] is disabled.
- The presence or absence of whitespace following a function name is used to distinguish between a built-in function and stored function that have the same name (for example, PI() [975] versus PI ()).

For functions that are no longer affected by IGNORE_SPACE [573] as of MySQL 5.1.13, that strategy no longer works. Either of the following approaches can be used if you have code that is subject to the preceding incompatibility:

- If a stored function has a name that conflicts with a built-in function, refer to the stored function with a schema name qualifier, regardless of whether whitespace is present. For example, write *schema_name*.PI() or *schema_name*.PI ().
- Alternatively, rename the stored function to use a nonconflicting name and change invocations of the function to use the new name.

(Bug #21114)

- **Incompatible Change**: The innodb_buffer_pool_awe_mem_mb [1361] system variable has been removed and should no longer be used.
- **MySQL Cluster**: A change in the interfaces for the INFORMATION_SCHEMA.FILES table has made the table accessible to storage engines other than NDB. (Bug #23013)
- If the user specified the server options --max-connections=*N* [493] or --table-open-cache=*M* [530], a warning would be given in some cases that some values were recalculated, with the result that --table-open-cache [530] could be assigned greater value.

  In such cases, both the warning and the increase in the --table-open-cache [530] value were completely harmless. Note also that it is not possible for the MySQL Server to predict or to control limitations on the maximum number of open files, since this is determined by the operating system.

  The value of --table-open-cache [530] is no longer increased automatically, and a warning is now given only if some values had to be decreased due to operating system limits. (Bug #21915)
- For the CALL statement, stored procedures that take no arguments now can be invoked without parentheses. That is, CALL p() and CALL p are equivalent. (Bug #21462)
- Binary distributions of MySQL 5.1.12 were built without support for partitioning. This has been corrected except for NetWare. (Bug #23949)
- mysql_upgrade now passes all the parameters specified on the command line to both mysqlcheck and mysql using the upgrade_defaults file. (Bug #20100)
- mysqldump --single-transaction now uses START TRANSACTION /*!40100 WITH CONSISTENT SNAPSHOT */ rather than BEGIN to start a transaction, so that a consistent snapshot will be used on those servers that support it. (Bug #19660)

Bugs Fixed

- **Performance**: InnoDB showed substandard performance with multiple queries running concurrently. (Bug #15815)
- **Important Change**: When installing MySQL on AIX 5.3, you must upgrade AIX to technology level 7 (5300-07) to ensure the required thread libraries are available.
- **MySQL Cluster**: When inserting a row into an NDB table with a duplicate value for a nonprimary unique key, the error issued would reference the wrong key. (Bug #21072)

- **MySQL Cluster**: Multiple node restarts in rapid succession could cause a system restart to fail , or induce a race condition. (Bug #22892, Bug #23210)
- **MySQL Cluster**: Attempting to create a unique constraint with `USING HASH` on an `NDB` table caused `mysqld` to crash. (Bug #21873)
- **MySQL Cluster**: If a node restart could not be performed from the REDO log, no node takeover took place. This could cause partitions to be left empty during a system restart. (Bug #22893)
- **MySQL Cluster**: `INSERT ... ON DUPLICATE KEY UPDATE` on an `NDB` table could lead to deadlocks and memory leaks. (Bug #23200)
- **MySQL Cluster**: Backup of a cluster failed if there were any tables with 128 or more columns. (Bug #23502)
- **MySQL Cluster**: The management client command `ALL DUMP 1000` would cause the cluster to crash if data nodes were connected to the cluster but not yet fully started. (Bug #23203)
- **MySQL Cluster**: An `NDB` source file included a `memset()` call with reversed arguments. (Bug #23169)
- **MySQL Cluster**: Cluster backups failed when there were more than 2048 schema objects in the cluster. (Bug #23499)
- **MySQL Cluster**: Restoring a cluster failed if there were any tables with 128 or more columns. (Bug #23494)
- **MySQL Cluster**: Aborting a cluster backup too soon after starting it caused a forced shutdown of the data nodes. (Bug #19148)
- **Replication**: Column names were not quoted properly for replicated views. (Bug #19736)
- **Replication**: Transient errors in replication from master to slave may trigger multiple `Got fatal error 1236: 'binlog truncated in the middle of event'` errors on the slave. (Bug #4053)
- **Disk Data**: In the event of an aborted multiple update, the space in the Disk Data log buffer to be freed as a result was actually freed twice, which could eventually lead to a crash. (Bug #23430)
- **Cluster API**: When multiple processes or threads in parallel performed the same ordered scan with exclusive lock and updated the retrieved records, the scan could skip some records, which as a result were not updated. (Bug #20446)
- `FORMAT(X,D)` [952] did not accept a nonconstant value for *D*. (Bug #48374)
- There was a race condition in the `InnoDB` `fil_flush_file_spaces()` function. (Bug #24098)
- Use of `PREPARE` with a `CREATE PROCEDURE` statement that contained a syntax error caused a server crash. (Bug #21856)
- The optimizer failed to use equality propagation for `BETWEEN` [941] and `IN` predicates with string arguments. (Bug #22753)
- Use of a subquery that invoked a function in the column list of the outer query resulted in a memory leak. (Bug #21798)
- An unhandled `NULL` pointer caused a server crash. (Bug #22138)
- Incorrect warnings occurred for use of `CREATE TABLE ... LIKE` or `REPAIR TABLE` with the log tables. (Bug #21966)
- MySQL 5.0.26 introduced an ABI incompatibility, which this release reverts. Programs compiled against 5.0.26 are not compatible with any other version and must be recompiled. (Bug #23427)

- If `COMPRESS()` [1028] returned `NULL`, subsequent invocations of `COMPRESS()` [1028] within a result set or within a trigger also returned `NULL`. (Bug #23254)
- It was not possible to do an atomic rename of the log tables without the possibility of losing rows. Now you can do this:

```
USE mysql;
CREATE TABLE IF NOT EXISTS general_log2 LIKE general_log;
RENAME TABLE general_log TO general_log_backup, general_log2 TO general_log;
```

  (Bug #21785, Bug #17544)
- The return value from `my_seek()` was ignored. (Bug #22828)
- The `Host` column in `SHOW PROCESSLIST` output was blank when the server was started with the `--skip-grant-tables` [443] option. (Bug #22723)
- Use of a DES-encrypted SSL certificate file caused a server crash. (Bug #21868)
- For not-yet-authenticated connections, the `Time` column in `SHOW PROCESSLIST` was a random value rather than `NULL`. (Bug #23379)
- The optimizer used the `ref` [697] join type rather than `eq_ref` [697] for a simple join on strings. (Bug #22367)
- The `Handler_rollback` [562] status variable sometimes was incremented when no rollback had taken place. (Bug #22728)
- `WITH ROLLUP` could group unequal values. (Bug #20825)
- yaSSL-related memory leaks were detected by Valgrind. (Bug #23981)
- *`M`* `% 0` returns `NULL`, but (*`M`* `% 0) IS NULL` evaluated to false. (Bug #23411)
- Insufficient memory (`myisam_sort_buffer_size` [503]) could cause a server crash for several operations on `MyISAM` tables: repair table, create index by sort, repair by sort, parallel repair, bulk insert. (Bug #23175)
- If an `init_connect` [481] SQL statement produced an error, the connection was silently terminated with no error message. Now the server writes a warning to the error log. (Bug #22158)
- Some queries that used `MAX()` [1046] and `GROUP BY` could incorrectly return an empty result. (Bug #22342)
- The server did not allocate sufficient memory for some queries for which a `DISTINCT` to `GROUP BY` conversion is possible and an `ORDER BY` clause is present, resulting in a server crash. (Bug #20503)
- MySQL failed to build on Linux/Alpha. (Bug #23256)

  References: This bug was introduced by Bug #21250.
- Within a prepared statement, `SELECT (COUNT(*) = 1)` (or similar use of other aggregate functions) did not return the correct result for statement re-execution. (Bug #21354)
- `InnoDB` crashed when trying to display an error message about a foreign key constraint violation when the two tables are in different schemas. (Bug #23368)
- Use of `SQL_BIG_RESULT` did not influence the sort plan for query execution. (Bug #22781)
- The column default value in the output from `SHOW COLUMNS` or `SELECT FROM INFORMATION_SCHEMA.COLUMNS` was truncated to 64 characters. (Bug #23037)
- In `mysql`, invoking `connect` or `\r` with very long *`db_name`* or *`host_name`* parameters caused buffer overflow. (Bug #20894)

- `mysql` did not check for errors when fetching data during result set printing. (Bug #22913)
- The optimizer sometimes mishandled R-tree indexes for `GEOMETRY` data types, resulting in a server crash. (Bug #21888)
- Within a stored routine, a view definition cannot refer to routine parameters or local variables. However, an error did not occur until the routine was called. Now it occurs during parsing of the routine creation statement.

  Note

  A side effect of this fix is that if you have already created such routines, and error will occur if you execute `SHOW CREATE PROCEDURE` or `SHOW CREATE FUNCTION`. You should drop these routines because they are erroneous.

  (Bug #20953)
- Range searches on columns with an index prefix could miss records. (Bug #20732)
- If a table contains an `AUTO_INCREMENT` column, inserting into an insertable view on the table that does not include the `AUTO_INCREMENT` column should not change the value of `LAST_INSERT_ID()` [1036], because the side effects of inserting default values into columns not part of the view should not be visible. MySQL was incorrectly setting `LAST_INSERT_ID()` [1036] to zero. (Bug #22584)
- Adding a day, month, or year interval to a `DATE` value produced a `DATE`, but adding a week interval produced a `DATETIME` value. Now all produce a `DATE` value. (Bug #21811)
- For a debug server, a reference to an undefined user variable in a prepared statement executed with `EXECUTE` caused an assertion failure. (Bug #19356)
- At shutdown, Instance Manager told guarded server instances to stop, but did not wait until they actually stopped. (Bug #17486)
- `FLUSH INSTANCES` in Instance Manager triggered an assertion failure. (Bug #19368)
- `LIKE` searches failed for indexed `utf8` character columns. (Bug #20471)
- `mysqldump --xml` produced invalid XML for `BLOB` data. (Bug #19745)
- The range analysis optimizer did not take into account predicates for which an index could be used after reading `const` [696] tables. In some cases this resulted in nonoptimal execution plans. (Bug #19579)
- With `sql_mode = TRADITIONAL`, MySQL incorrectly aborted on warnings within stored routines and triggers. (Bug #20028)
- `DELETE IGNORE` could hang for foreign key parent deletes. (Bug #18819)
- `ALTER TABLE` was not able to rename a view. (Bug #14959)
- `mysql-test-run` did not work correctly for RPM-based installations. (Bug #17194)
- A literal string in a `GROUP BY` clause could be interpreted as a column name. (Bug #14019)
- The value of the `warning_count` [538] system variable was not being calculated correctly (also affecting `SHOW COUNT(*) WARNINGS`). (Bug #19024)
- A client library crash was caused by executing a statement such as `SELECT * FROM t1 PROCEDURE ANALYSE()` using a server side cursor on a table `t1` that does not have the same number of columns as the output from `PROCEDURE ANALYSE()`. (Bug #17039)
- `InnoDB` used table locks (not row locks) within stored functions. (Bug #18077)

- Within a trigger for a base table, selecting from a view on that base table failed. (Bug #19111)
- Statements such as `DROP PROCEDURE` and `DROP VIEW` were written to the binary log too late due to a race condition. (Bug #14262)
- `mysql` would lose its connection to the server if its standard output was not writable. (Bug #17583)
- The `WITH CHECK OPTION` for a view failed to prevent storing invalid column values for `UPDATE` statements. (Bug #16813)
- Several string functions could return incorrect results when given very large length arguments. (Bug #10963)
- Entries in the slow query log could have an incorrect `Rows_examined` value. (Bug #12240)
- `OPTIMIZE TABLE` with `myisam_repair_threads` [502] > 1 could result in `MyISAM` table corruption. (Bug #8283)
- Lack of validation for input and output `TIME` values resulted in several problems: `SEC_TO_TIME()` [991] in some cases did not clip large values to the `TIME` range appropriately; `SEC_TO_TIME()` [991] treated `BIGINT UNSIGNED` values as signed; only truncation warnings were produced when both truncation and out-of-range `TIME` values occurred. (Bug #11655, Bug #20927)
- `FROM_UNIXTIME()` [987] did not accept arguments up to `POWER(2,31)-1` [975], which it had previously. (Bug #9191)

Changes in MySQL 5.1.12 (2006-10-24)

This is a new Beta development release, fixing recently discovered bugs.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details, please see http://www.mysql.com/products/enterprise.

Functionality Added or Changed

- **Incompatible Change**: **MySQL Cluster**: MySQL Cluster node and system restarts formerly required that all fragments use the same local checkpoint (LCP); beginning with this version, it is now possible for different fragments to use different LCPs during restarts. This means that data node file systems must be rebuilt as part of any upgrade to this version by restarting all data nodes with the `--initial` option.

  See Upgrade and downgrade compatibility: MySQL 5.1, and related sections of the Manual before upgrading a MySQL Cluster to version 5.1.12 or later. (Bug #21478, Bug #21271)

- **Incompatible Change**: In the `INFORMATION_SCHEMA.EVENTS` table, the `EVENT_DEFINITION` column now contains the SQL executed by a scheduled event.

  The `EVENT_BODY` column now contains the language used for the statement or statements shown in `EVENT_DEFINITION`. In MySQL 5.1, the value shown in `EVENT_BODY` is always `SQL`.

  These changes were made to bring this table into line with the `INFORMATION_SCHEMA.ROUTINES` table, and that table's `ROUTINE_BODY` and `ROUTINE_DEFINITION` columns. (Bug #16992)

- **Incompatible Change**: The namespace for scheduled events has changed, such that events are no longer unique to individual users. This also means that a user with the `EVENT` [626] privilege on a given database can now view, alter, or drop any events defined on that database.

  If you used scheduled events in an earlier MySQL 5.1 release, you should rename any of them having the same name and defined on the same database but belonging to different users—so that all events in a given database have unique names—*before* upgrading to 5.1.12 (or newer).

For additional information, see The Event Scheduler and MySQL Privileges.

- **Incompatible Change**: Storage engines can be pluggable at runtime, so the distinction between disabled and invalid storage engines no longer applies. This affects the `NO_ENGINE_SUBSTITUTION` [574] SQL mode, as described in Server SQL Modes.

- **Incompatible Change**: The full-text parser plugin interface has changed in two ways:

  - The `MYSQL_FTPARSER_PARAM` structure has a new `flags` member. This is zero if there are no special flags, or `MYSQL_FTFLAGS_NEED_COPY`, which means that `mysql_add_word()` must save a copy of the word (that is, it cannot use a pointer to the word because the word is in a buffer that will be overwritten.)

    This flag might be set or reset by MySQL before calling the parser plugin, by the parser plugin itself, or by the `mysql_parse()` function.

  - The `mysql_parse()` and `mysql_add_word()` functions now take a `MYSQL_FTPARSER_PARAM` as their first argument, not a `MYSQL_FTPARSER_PARAM::mysql_ftparam` as before.

  These changes are not backward compatible, so the API version (`MYSQL_FTPARSER_INTERFACE_VERSION`) has changed. For additional information, see Writing Plugins.

- **Incompatible Change**: The plugin interface has changed: The `st_mysql_plugin` structure has a new `license` [487] member to indicate the license type. (The permissible values are defined in `mysql/plugin.h`.) This change is not backward compatible, so the API version (`MYSQL_PLUGIN_INTERFACE_VERSION`) has changed. For additional information, see Writing Plugins.

- **Incompatible Change**: The permitted values for and behavior of the `event_scheduler` [474] system variable have changed. Permitted values are now `ON`, `OFF`, and `DISABLED`, with `OFF` being the default. It is not possible to change its value to or from `DISABLED` while the server is running.

  For details, see Event Scheduler Overview.

- **Incompatible Change**: A number of MySQL constructs are now prohibited in partitioning expressions, beginning with this release. These include the following:

  - A number of MySQL functions. For a complete list of these, see Partitioning Limitations Relating to Functions.

  - The bit operators `|` [1025], `&` [1025], `^` [1026], `<<` [1026], `>>` [1026], and `~` [1026].

  - Nested function calls.

  - Calls to stored routines, UDFs, or plugins.

  - Character-to-integer conversions involving non-8-bit character sets or any of the `latin1_german2_ci`, `latin2_czech_cs`, or `cp1250_czech_cs` collations.

  These restrictions were added in part as a result of Bug #18198 and related bug reports.

  For more information about these and other restrictions on partitioned tables in MySQL, see Restrictions and Limitations on Partitioning.

- **Incompatible Change**: Support for the BerkeleyDB (`BDB`) engine has been dropped from this release. Any existing tables that are in BDB format will not be readable from within MySQL from 5.1.12 or newer. You should convert your tables to another storage engine *before* upgrading to 5.1.12.

  Because of this change, the `SHOW [BDB] LOGS` statement has been dropped.

- **Incompatible Change**: For `GRANT` and `REVOKE`, `ON *` previously granted and revoked privileges for the default database if there was a default database and global privileges if there was none. Now `ON *` requires a default database and produces an error if there is none.
- **Important Change**: **Partitioning**: **MySQL Cluster**: It is no longer possible to create Cluster tables using any partitioning type other than [`LINEAR`] `KEY`. Attempting to do so now raises an error.
- **Important Change**: **MySQL Cluster**: `LOAD DATA INFILE` no longer causes an implicit commit for all storage engines. It now causes an implicit commit only for tables using the `NDB` storage engine. (Bug #11151)
- **Important Change**: **MySQL Cluster**: The status variables `Ndb_connected_host` and `Ndb_connected_port` were renamed to `Ndb_config_from_host` [1947] and `Ndb_config_from_port` [1947], respectively.
- **Important Change**: **Replication**: The default value for the `--binlog-format` [419] server option is now `MIXED`.
- **MySQL Cluster**: The `ndb_config` utility now accepts `-c` as a short form of the `--ndb-connectstring` option. (Bug #22295)
- **MySQL Cluster**: Added the `--bind-address` [1953] option for `ndbd`. This permits a data node process to be bound to a specific network interface. (Bug #22195)
- **MySQL Cluster**: The `Ndb_number_of_storage_nodes` system variable was renamed to `Ndb_number_of_data_nodes` [1948]. (Bug #20848)
- **MySQL Cluster**: A number of erroneous, misleading, or missing error messages have been corrected. (Bug #17297, Bug #19543)
- **MySQL Cluster**: The `HELP` command in the Cluster management client now provides command-specific help. For example, `HELP RESTART` in `ndb_mgm` provides detailed information about the `RESTART` command. (Bug #19620)
- **MySQL Cluster**: Added the `--ndb-use-copying-alter-table` option to `mysqld` to provide a fallback in case of problems with online `ALTER TABLE` operations on `NDB` tables.
- **MySQL Cluster**: Backup messages are no longer printed to the cluster log.
- **Replication**: The default binary log format (as used during replication) is now Mixed based, automatically using a combination of row-based and statement based log events as appropriate.
- **Cluster API**: Two new NDB API methods `aggregate()` and `validate()` were added to the `Table` class. This was done to rectify the following issues:

  - Under some conditions, the data distribution could become unbalanced in a MySQL Cluster with 2 or more node groups following the creation of a new table.
  - Data was stored unevenly between partitions due to all `BLOB` data being placed in partition 0.

  (Bug #21690)
- The `BINARY` keyword now is forbidden as a data type attribute in stored routines (for example, `DECLARE v1 VARCHAR(25) BINARY`), because `DECLARE` does not support collations, and in this context `BINARY` specifies the binary collation of the variable's character set. (Bug #20701)
- `InnoDB` now honors `IGNORE INDEX`. Previously using `IGNORE INDEX` in cases where an index sort would be slower than a filesort had no effect when used with `InnoDB` tables. (Bug #21174)
- `mysqlslap` threads now try to connect up to 10 times if the initial connect attempt fails. (Bug #21297)

- For `mysqldump`, the output generated by the server when using the `--xml` [302] option has changed with regard to null values. It now matches the output from `mysqldump --xml` [302]. That is, a column containing a `NULL` value is now reported as

  ```
  <field name="column_name" xsi:nil="true" />
  ```

  whereas a column containing the string value `'NULL'` is reported as

  ```
  <field name="column_name">NULL</field>
  ```

  and a column containing an empty string is reported as

  ```
  <field name="column_name"></field>
  ```

  (Bug #21263)

- The `mysqld` and `mysqlmanager` man pages have been reclassified from volume 1 to volume 8. (Bug #21220)

- The following statements now can be executed as prepared statements (using `PREPARE` plus `EXECUTE`):

  ```
  CACHE INDEX
  CHANGE MASTER
  CHECKSUM {TABLE | TABLES}
  {CREATE | RENAME | DROP} DATABASE
  {CREATE | RENAME | DROP} USER
  FLUSH {TABLE | TABLES | TABLES WITH READ LOCK | HOSTS | PRIVILEGES
    | LOGS | STATUS | MASTER | SLAVE | DES_KEY_FILE | USER_RESOURCES}
  GRANT
  REVOKE
  KILL
  LOAD INDEX INTO CACHE
  RESET {MASTER | SLAVE | QUERY CACHE}
  SHOW BINLOG EVENTS
  SHOW CREATE {PROCEDURE | FUNCTION | EVENT | TABLE | VIEW}
  SHOW {AUTHORS | CONTRIBUTORS | WARNINGS | ERRORS}
  SHOW {MASTER | BINARY} LOGS
  SHOW {MASTER | SLAVE} STATUS
  SLAVE {START | STOP}
  INSTALL PLUGIN
  UNINSTALL PLUGIN
  ```

  (Bug #20665)

- `mysqldump` now has a `--flush-privileges` [297] option. It causes `mysqldump` to emit a `FLUSH PRIVILEGES` statement after dumping the `mysql` database. This option should be used any time the dump contains the `mysql` database and any other database that depends on the data in the `mysql` database for proper restoration. (Bug #21424)

- Memory consumption of the `InnoDB` data dictionary cache was roughly halved by cleaning up the data structures. (Bug #20877)

- `TIMESTAMP` columns that are `NOT NULL` now are reported that way by `SHOW COLUMNS` and `INFORMATION_SCHEMA`. (Bug #20910)

- The `STATE` column of the `INFORMATION_SCHEMA.PROCESSLIST` table was increased from 30 to 64 characters to accommodate longer state values. (Bug #21652)

- The number of `InnoDB` threads is no longer limited to 1,000 on Windows. (Bug #22268)

- The `mysql` client now permits `\l` in the `prompt` command argument, to insert the current delimiter into the prompt. (Bug #14448)

- `SHOW CREATE TABLE` now shows constraints for `InnoDB` tables. (Bug #16614)

- The `mysqldumpslow` script has been moved from client RPM packages to server RPM packages. This corrects a problem where `mysqldumpslow` could not be used with a client-only RPM install, because it depends on `my_print_defaults` which is in the server RPM. (Bug #20216)
- `EXPLAIN EXTENDED` now shows a `filtered` column that is an estimated percentage of the examined rows that will be joined with the previous tables. This was added while dealing with a problem of MySQL choosing the wrong index for some queries. (Bug #14940)
- The source distribution has been updated so that the UDF example can be compiled under Windows with `CMake`. See Compiling and Installing User-Defined Functions. (Bug #19121)
- `TEXT` and `BLOB` columns do not support `DEFAULT` values. However, when a default of `''` was specified, the specification was silently ignored. This now results in a warning, or an error in strict mode. (Bug #19498)
- The default value of the `tmp_table_size` [534] system variable was lowered from 32MB to 16MB because it is bounded by the value of `max_heap_table_size` [495], which has a default of 16MB. (Bug #18875)
- For `mysqlshow`, if a database name argument contains wildcard characters (such as "_") but matches a single database name exactly, treat the name as a literal name. This enables a command such as `mysqlshow information_schema` to work without having to escape the wildcard character. (Bug #19147)
- Added the `--set-charset` [301] option to `mysqlbinlog` to enable the character set to be specified for processing binary log files. (Bug #18351)
- `configure` now defines the symbol `DBUG_ON` in `config.h` to indicate whether the source tree is configured to be compiled with debugging support. (Bug #19517)
- In the `INFORMATION_SCHEMA.ROUTINES` table the `ROUTINE_DEFINITION` column now is defined as `NULL` rather than `NOT NULL`. Also, `NULL` rather than the empty string is returned as the column value if the user does not have sufficient privileges to see the routine definition. (Bug #20230)
- On Windows, typing **Control+C** while a query was running caused the `mysql` client to crash. Now it causes `mysql` to attempt to kill the current statement. If this cannot be done, or **Control+C** is typed again before the statement is killed, `mysql` exits. (In other words, `mysql`'s behavior with regard to **Control+C** is now the same as it is on Unix platforms.) (Bug #17926)

  References: See also Bug #1989.
- The MySQL distribution now compiles on UnixWare 7.13. (Bug #20190)
- The `ExtractValue()` [1016] function now produces an error when passed an XML fragment that is not well-formed.

  (Previously, the function permitted invalid XML fragments to be used.) (Bug #18201)
- Log table changes: By default, the log tables use the `CSV` storage engine, as before. But now the log tables can be altered to use the `MyISAM` storage engine. You cannot use `ALTER TABLE` to alter a log table that is in use. The log must be disabled first. No engines other than `CSV` or `MyISAM` are legal for the log tables. The use of `DROP TABLE` for log tables is similarly restricted: It cannot be used to drop a log table that is in use. The log must be disabled first. (These changes also correct a deadlock that occurred for an attempt to drop an in-use log table.) (Bug #18559)
- The bundled yaSSL library licensing has added a FLOSS exception similar to MySQL to resolve licensing incompatibilities with MySQL. (See the `extra/yassl/FLOSS-EXCEPTIONS` file in a MySQL source distribution for details.) (Bug #16755)
- The `LOAD DATA FROM MASTER` and `LOAD TABLE FROM MASTER` statements are deprecated. See `LOAD DATA FROM MASTER` Syntax, for recommended alternatives. (Bug #9125, Bug #20596, Bug #14399, Bug #12187, Bug #15025, Bug #18822)

- If a `DROP VIEW` statement named multiple views, it stopped with an error if a nonexistent view was named and did not drop the remaining views. Now it continues on and reports an error at the end, similar to `DROP TABLE`. (Bug #11551)
- The `LEFT()` [953] and `RIGHT()` [956] functions return `NULL` if any argument is `NULL`. (Bug #11728)
- The `mysql` client used the default character set if it automatically reconnected to the server, which is incorrect if the character set had been changed. To enable the character set to remain synchronized on the client and server, the `mysql` command `charset` (or `\C`) that changes the default character set and now also issues a `SET NAMES` statement. The changed character set is used for reconnects. (Bug #11972)
- For spatial data types, the server formerly returned these as `VARSTRING` values with a binary collation. Now the server returns spatial values as `BLOB` values. (Bug #10166)
- For a successful dump, `mysqldump` now writes a SQL comment to the end of the dump file in the following format:

  ```
  -- Dump completed on YYYY-MM-DD hh:mm:ss
  ```

  (Bug #10877)
- There were several issues regarding how `SHOW STATUS` affected some status variables and logging which could impact monitoring the MySQL Server. The behavior of this statement has been modified in two ways:

  - `SHOW STATUS` is no longer logged to the slow query log.
  - `SHOW STATUS` no longer updates any session status variables, except for `com_show_status`.

  However, `SHOW STATUS` continues to update *global* status variables to enable monitoring of what the server is actually doing. This is because `SHOW STATUS` creates temporary tables that may affect performance if it is called excessively often. (Bug #10210)

  References: See also Bug #19764.
- The general query log and slow query logs now can be enabled or disabled at runtime with the `general_log` [477] and `slow_query_log` [522] system variables, and the name of the log files can be changed by setting the `general_log_file` [478] and `slow_query_log_file` [523] system variables. See The General Query Log, and The Slow Query Log.
- Added the `SHOW CONTRIBUTORS` statement.
- The Instance Manager `--passwd` [368] option has been renamed to `--print-password-line` [368]. Other options were added to enable management of the IM password file from the command line: `--add-user` [366], `--drop-user` [366], `--edit-user` [367], `--list-users` [367], `--check-password-file` [366], `--clean-password-file` [366], `--username` [369], and `--password` [367]. The `--mysqld-safe-compatible` [367] option was added to cause the Instance Manner to act similarly to `mysqld_safe`.
- The bundled yaSSL library was upgraded to version 1.3.7.
- Using `--with-debug` [135] to configure MySQL with debugging support enables you to use the `--debug="d,parser_debug"` [423] option when you start the server. This causes the Bison parser that is used to process SQL statements to dump a parser trace to the server's standard error output. Typically, this output is written to the error log.
- A new system variable, `lc_time_names` [487], specifies the locale that controls the language used to display day and month names and abbreviations. This variable affects the output from the `DATE_FORMAT()` [985], `DAYNAME()` [986] and `MONTHNAME()` [989] functions. See MySQL Server Locale Support.
- `SHOW STATUS` no longer updates any session status variables, except for `com_show_status`.

- `INFORMATION_SCHEMA` contains new tables, `GLOBAL_STATUS`, `SESSION_STATUS`, `GLOBAL_VARIABLES`, and `SESSION_VARIABLES`, that correspond to the output from the `SHOW {GLOBAL|SESSION} STATUS` and `SHOW {GLOBAL|SESSION} VARIABLES` statements.
- For the `mysql` client, typing **Control+C** causes `mysql` to attempt to kill the current statement. If this cannot be done, or **Control+C** is typed again before the statement is killed, `mysql` exits. Previously, **Control+C** caused `mysql` to exit in all cases. (Bug #1989)
- Program Database files (extension `.pdb`) are now included by default in Windows distributions. These can be used to help diagnose problems with `mysqld` and other tools. See Debugging a MySQL Server.
- `SHOW STATUS` is no longer logged to the slow query log.
- Binary MySQL distributions no longer include a `mysqld-max` server. Instead, distributions contain a binary that includes the features previously included in the `mysqld-max` binary.
- It is no longer possible to create partitioned tables using the `CSV` storage engine.

Bugs Fixed

- **Security Fix**: A stored routine created by one user and then made accessible to a different user using `GRANT EXECUTE` could be executed by that user with the privileges of the routine's definer. (Bug #18630, CVE-2006-4227)
- **Security Fix**: If a user has access to `MyISAM` table *`t`*, that user can create a `MERGE` table *`m`* that accesses *`t`*. However, if the user's privileges on *`t`* are subsequently revoked, the user can continue to access *`t`* by doing so through *`m`*. If this behavior is undesirable, you can start the server with the new `--skip-merge` [443] option to disable the `MERGE` storage engine. (Bug #15195, CVE-2006-4031)
- **Security Fix**: On Linux, and possibly other platforms using case-sensitive file systems, it was possible for a user granted rights on a database to create or access a database whose name differed only from that of the first by the case of one or more letters. (Bug #17647, CVE-2006-4226)
- **Incompatible Change**: For `utf8` columns, the full-text parser incorrectly considered several nonword punctuation and whitespace characters as word characters, causing some searches to return incorrect results.

  The fix involves a change to the full-text parser, so any tables that have `FULLTEXT` indexes on `utf8` columns must be repaired with `REPAIR TABLE`:

  ```
  REPAIR TABLE tbl_name QUICK;
  ```

  (Bug #19580)
- **MySQL Cluster**: **Packaging**: The `ndb_mgm` program was included in both the `MySQL-ndb-tools` and `MySQL-ndb-management` RPM packages, resulting in a conflict if both were installed. Now `ndb_mgm` is included only in `MySQL-ndb-tools`. (Bug #21058)
- **MySQL Cluster**: **Replication**: A `DELETE FROM table` with no `WHERE` clause (deleting all rows) running concurrently with `INSERT` statements on a storage engine with row-level locking (such as `NDB`) could produce inconsistent results when using statement-based replication. (Bug #19066)
- **MySQL Cluster**: **Replication**: (Replication): A node failure could send duplicate events, causing a `mysqld` replicating tables containing `BLOB`s to crash.
- **MySQL Cluster**: In some situations with a high disk-load, writing of the redo log could hang, causing a crash with the error message `GCP STOP detected`. (Bug #20904)
- **MySQL Cluster**: Responses to the `ALL DUMP 1000` management client command were printed multiple times in the cluster log for each cluster node. (Bug #21044)

- **MySQL Cluster**: Partition distribution keys were updated only for the primary and starting replicas during node recovery. This could lead to node failure recovery for clusters having an odd number of replicas.

  Note

  For best results, use values for `NumberOfReplicas` that are even powers of 2.

  (Bug #21535)

- **MySQL Cluster**: The message `Error 0 in readAutoIncrementValue(): no Error` was written to the error log whenever `SHOW TABLE STATUS` was performed on a Cluster table that did not have an `AUTO_INCREMENT` column. (Bug #21033)

- **MySQL Cluster**: The output for the `--help` option used with `NDB` executable programs (such as `ndbd`, `ndb_mgm`, `ndb_restore`, `ndb_config`, and others mentioned in MySQL Cluster Programs) referred to the `Ndb.cfg` file, instead of to `my.cnf`. (Bug #21585)

- **MySQL Cluster**: The failure of a unique index read due to an invalid schema version could be handled incorrectly in some cases, leading to unpredictable results. (Bug #21384)

- **MySQL Cluster**: The `ndb_mgm` management client did not set the exit status on errors, always returning 0 instead. (Bug #21530)

- **MySQL Cluster**: Under some circumstances, local checkpointing would hang, keeping any unstarted nodes from being started. (Bug #20895)

- **MySQL Cluster**: Setting `TransactionDeadlockDetectionTimeout` [1841] to a value greater than 12000 would cause scans to deadlock, time out, fail to release scan records, until the cluster ran out of scan records and stopped processing. (Bug #21800)

- **MySQL Cluster**: Some queries involving joins on very large `NDB` tables could crash the MySQL server. (Bug #21059)

- **MySQL Cluster**: A partial rollback could lead to node restart failures. (Bug #21536)

- **MySQL Cluster**: The `ndb_size.pl` script did not account for `TEXT` and `BLOB` column values correctly. (Bug #21204)

- **MySQL Cluster**: A race condition could in some circumstances following a `DROP TABLE`. (Bug #20897)

- **MySQL Cluster**: Attempting to create an `NDB` table on a MySQL server with an existing non-Cluster table with the same name in the same database could result in data loss or corruption. Now, if such a table is encountered during autodiscovery, a warning is written to the error log of the affected `mysqld`, and the local table is overwritten. (Bug #21378)

- **MySQL Cluster**: The `--help` output from `NDB` binaries did not include file-related options. (Bug #21994)

- **MySQL Cluster**: Restarting a data node while DDL operations were in progress on the cluster could cause other data nodes to fail. This could also lead to `mysqld` hanging or crashing under some circumstances. (Bug #21017, Bug #21050)

- **MySQL Cluster**: The server provided a nondescriptive error message when encountering a fatally corrupted REDO log. (Bug #21615)

- **MySQL Cluster**: A scan timeout returned Error 4028 (`Node failure caused abort of transaction`) instead of Error 4008 (`Node failure caused abort of transaction...`). (Bug #21799)

- **MySQL Cluster**: A memory leak occurred when running `ndb_mgm -e "SHOW"`. (Bug #21670)

- **MySQL Cluster**: A vague error message was returned when reading both schema files during a restart of the cluster. (Bug #20860)
- **MySQL Cluster**: Cluster logs were not rotated following the first rotation cycle. (Bug #21345)
- **MySQL Cluster**: When the redo buffer ran out of space, a `Pointer too large` error was raised and the cluster could become unusable until restarted with `--initial`. (Bug #20892)
- **MySQL Cluster**: (NDB API): Inacivity timeouts for scans were not correctly handled. (Bug #23107)
- **MySQL Cluster**: The server did not honor the value set for `ndb_cache_check_time` [1922] in the `my.cnf` file. (Bug #20708)
- **MySQL Cluster**: (NDB API): Attempting to read a nonexistent tuple using `Commit` mode for `NdbTransaction::execute()` caused node failures. (Bug #22672)
- **MySQL Cluster**: Inserting into an `NDB` table failed when the table had no primary key but had a unique key added after table was created on one or more `NOT NULL` columns. This occurred when the unique key had been adding using either `ALTER TABLE` or `CREATE UNIQUE KEY`. (Bug #22838)
- **MySQL Cluster**: `REPLACE` statements did not work correctly on an `NDB` table having both a primary key and a unique key. In such cases, proper values were not set for columns which were not explicitly referenced in the statement. (Bug #20728)
- **MySQL Cluster**: Condition pushdown did not work correctly with `DATETIME` columns. (Bug #21056)
- **MySQL Cluster**: The repeated creating and dropping of a table would eventually lead to `NDB` Error 826, `Too many tables and attributes ... Insufficient space`. (Bug #20847)
- **MySQL Cluster**: The node recovery algorithm was missing a version check for tables in the `ALTER_TABLE_COMMITTED` state (as opposed to the `TABLE_ADD_COMMITTED` state, which has the version check). This could cause inconsistent schemas across nodes following node recovery. (Bug #21756)
- **MySQL Cluster**: Truncating a table on one `mysqld` caused other `mysqld` processes connected to the cluster to return `ERROR 1412 (HY000): Table definition has changed, please retry transaction` on subsequent queries. (Bug #20705)
- **MySQL Cluster**: In a cluster with more than 2 replicas, a manual restart of one of the data nodes could fail and cause the other nodes in the same node group to shut down. (Bug #21213)
- **MySQL Cluster**: When attempting to restart the cluster following a data import, the cluster failed during Phase 4 of the restart with `Error 2334: Job buffer congestion`. (Bug #20774)
- **MySQL Cluster**: Using an invalid node ID with the management client `STOP` command could cause `ndb_mgm` to hang. (Bug #20575)
- **MySQL Cluster**: `TEXT` columns in Cluster tables having both an explicit primary key and a unique key were not correctly updated by `REPLACE` statements. (Bug #19906)
- **MySQL Cluster**: A cluster data node could crash when an ordered index became full before the table containing the index was full. (Bug #14935)
- **MySQL Cluster**: Resources for unique indexes on Cluster table columns were incorrectly allocated, so that only one-fourth as many unique indexes as indicated by the value of `UniqueHashIndexes` could be created. (Bug #19623)
- **MySQL Cluster**: It was possible to use port numbers greater than 65535 for `ServerPort` [1814] in the `config.ini` file. (Bug #19164)
- **MySQL Cluster**: Error messages given when trying to make online changes to parameters such as `NoOfReplicas` [1815] that can only be changed using a complete shutdown and restart of the cluster did not indicate the true nature of the problem. (Bug #19787)

- **MySQL Cluster**: Running `ndbd --nowait-nodes=id` where *`id`* was the node ID of a node that was already running would fail with an invalid error message. (Bug #20419)
- **MySQL Cluster**: `ndb_size.pl` and `ndb_error_reporter` were missing from RPM packages. (Bug #20426)
- **MySQL Cluster**: The `DATA_LENGTH` and `AVG_ROW_LENGTH` columns of the `INFORMATION_SCHEMA.TABLES` table did not report the size of variable-width column values correctly.

  See The `INFORMATION_SCHEMA TABLES` Table, for more information. (Bug #18413)
- **MySQL Cluster**: Trying to create or drop a table while a node was restarting caused the node to crash. This is now handled by raising an error. (Bug #18781)
- **MySQL Cluster**: New `mysqld` processes were permitted to connect without a restart of the cluster, causing the cluster to crash. (Bug #13266)
- **MySQL Cluster**: Following the restart of a management node, the Cluster management client did not automatically reconnect. (Bug #19873)
- **MySQL Cluster**: Renaming a table in such a way as to move it to a different database failed to move the table's indexes. (Bug #19967)
- **MySQL Cluster**: In rare situations with resource shortages, a crash could result from an insufficient number of `IndexScanOperation` objects. (Bug #19198)
- **MySQL Cluster**: (Disk Data): Deletes from Disk Data tables used a nonoptimal scan to find the rows to be deleted, resulting in poor performance. The fix causes disk order rather than memory order to be used, and can improve performance of Disk Data deletes by up to ~300% in some cases. (Bug #17929)
- **MySQL Cluster**: Running out of `DataMemory` [1817] could sometimes crash `ndbd` and `mysqld` processes. (Bug #19185)
- **MySQL Cluster**: A problem with error handling when `ndb_use_exact_count` [1932] was enabled could lead to incorrect values returned from queries using `COUNT()` [1045]. A warning is now returned in such cases. (Bug #19202)
- **MySQL Cluster**: `ndb_mgm -e show | head` would hang after displaying the first 10 lines of output. (Bug #19047)
- **MySQL Cluster**: `ndb_restore` did not always make clear that it had recovered successfully from temporary errors while restoring a cluster backup. (Bug #19651)
- **MySQL Cluster**: The failure of a data node when preparing to commit a transaction (that is, while the node's status was `CS_PREPARE_TO_COMMIT`) could cause the failure of other cluster data nodes. (Bug #20185)
- **MySQL Cluster**: A node failure during a scan could sometime cause the node to crash when restarting too quickly following the failure. (Bug #20197)
- **MySQL Cluster**: Data nodes added while the cluster was running in single user mode were all assigned node ID 0, which could later cause multiple node failures. Adding nodes while in single user mode is no longer possible. (Bug #20395)
- **MySQL Cluster**: For `NDB` and possibly `InnoDB` tables, a `BEFORE UPDATE` trigger could insert incorrect values. (Bug #18437)
- **MySQL Cluster**: `perror` did not properly report `NDB` error codes. (Bug #16561)
- **MySQL Cluster**: Under certain conditions, a starting node could miss transactions, leading to inconsistencies between the primary and backup replicas. (Bug #19929)

- **MySQL Cluster**: Running management client commands while `mgmd` was in the process of disconnecting could cause the management server to fail. (Bug #19932)
- **MySQL Cluster**: A `DELETE` of many rows immediately followed by an `INSERT` on the same table could cause the `ndbd` process on the backup replica to crash. (Bug #19293)
- **MySQL Cluster**: Creating tables with variable-size columns caused `DataMemory` [1817] to be used but not freed when the tables were dropped. (Bug #20007)
- **MySQL Cluster**: The management client `ALL STOP` command shut down `mgmd` processes (as well as `ndbd` processes). (Bug #18966)
- **MySQL Cluster**: A `CREATE TABLE` statement involving foreign key constraints raised an error rather than being silently ignored (see `CREATE TABLE` Syntax).

  This bug affected Cluster in MySQL 5.1 only. (Bug #18483)
- **MySQL Cluster**: The management client `ALL STATUS` command could sometimes report the status of some data nodes incorrectly. (Bug #13985)
- **MySQL Cluster**: An uncommitted row could sometimes be checkpointed and thus incorrectly included in a backup. (Bug #19928)
- **MySQL Cluster**: A problem with takeover during a system restart caused ordered indexes to be rebuilt incorrectly. This also adversely affected MySQL Cluster Replication. (Bug #15303)
- **MySQL Cluster**: An internal formatting error caused some management client error messages to be unreadable. (Bug #20016)
- **MySQL Cluster**: Restarting a failed node could sometimes crash the cluster. (Bug #18782)
- **MySQL Cluster**: In some cases where `SELECT COUNT(*)` from an `NDB` table should have yielded an error, `MAX_INT` was returned instead. (Bug #19914)
- **MySQL Cluster**: Under some circumstances, repeated DDL operations on one `mysqld` could cause failure of a second `mysqld` attached to the same cluster. (Bug #19770)
- **MySQL Cluster**: The error returned by the cluster when too many nodes were defined did not make clear the nature of the problem. (Bug #19045)
- **MySQL Cluster**: The `ndb_mgm` client command `ALL CLUSTERLOG STATISTICS=15` had no effect. (Bug #20336)
- **MySQL Cluster**: `LOAD DATA LOCAL` failed to ignore duplicate keys in Cluster tables. (Bug #19496)
- **MySQL Cluster**: An excessive number of `ALTER TABLE` operations could cause the cluster to fail with `NDB` error code 773 (`Out of string memory, please modify StringMemory`). (Bug #19275)
- **MySQL Cluster**: The cluster's data nodes failed while trying to load data when `NoOfFrangmentLogFiles` was set equal to 1. (Bug #19894)
- **MySQL Cluster**: For `ndb_mgmd`, Valgrind revealed problems with a memory leak and a dependency on an uninitialized variable. (Bug #19318, Bug #20333)
- **MySQL Cluster**: Renaming of table columns was not supported as fast a `ALTER TABLE` for NDB tables. (Bug #20456)
- **MySQL Cluster**: `SELECT ... FOR UPDATE` failed to lock the selected rows. (Bug #18184)
- **MySQL Cluster**: `TRUNCATE TABLE` failed to reset the `AUTO_INCREMENT` counter. (Bug #18864)
- **MySQL Cluster**: `SHOW ENGINE NDB STATUS` could sometimes return an incorrect value of `0` for the latest epoch, which could cause problems with synchronizing the binlog. (Bug #20142)

- **MySQL Cluster**: Repeated `CREATE` - `INSERT` - `DROP` operations on tables could in some circumstances cause the MySQL table definition cache to become corrupt, so that some `mysqld` processes could access table information but others could not. (Bug #18595)
- **MySQL Cluster**: The server failed with a nondescriptive error message when out of data memory. (Bug #18475)
- **MySQL Cluster**: Restoring a backup with `ndb_restore` failed when the backup had been taken from a cluster whose `DataMemory` [1817] had been completely used up. (Bug #19852)
- **MySQL Cluster**: Cluster system status variables were not updated properly. (Bug #11459)
- **MySQL Cluster**: The loss of one or more data nodes could sometimes cause `ndb_mgmd` to use a high amount of CPU (15 percent or more, as opposed to 1 to 2 percent normally).
- **MySQL Cluster**: (NDBAPI): Update operations on blobs were not checked for illegal operations.

  Note

  Read locks with blob update operations are now upgraded from read committed to read shared.
- **Partitioning**: Old partition and subpartition files were not always removed following `ALTER TABLE ... REORGANIZE PARTITION` statements. (Bug #20770)
- **Cluster Replication**: **Replication**: In some cases, a large number of MySQL servers sending requests to the cluster simultaneously could cause the cluster to crash. This could also be triggered by many `NDB` API clients making simultaneous event subscriptions or unsubscriptions. (Bug #20683)
- **Cluster Replication**: **Replication**: Data definition and data manipulation statements on different tables were not serialized correctly in the binary log. For example, there was no guarantee that a `CREATE TABLE` statement and an update on a different table would occur in the same order in the binary log as they did on the cluster being replicated. (Bug #18947)
- **Replication**: In mixed-format binary logging mode, stored functions, triggers, and views that use functions in their body that require row-based logging did not replicate reliably because the logging did not switch from statement-based to row-based format. For example, `INSERT INTO t SELECT FROM v`, where `v` is a view that selects `UUID()` [1042] could cause problems. This limitation has been removed. (Bug #20930)
- **Replication**: With mixed-format binary logging, `INSERT DELAYED` statements were logged using statement-based logging, and they did not replicate properly for statements that used values such as `UUID()` [1042], `RAND()` [975], or user-defined variables that require row-based logging. To correct this, the `DELAYED` handler thread how switches to row-based logging if the logging format is mixed. (Bug #20633, Bug #20649)
- **Replication**: With the `auto_increment_increment` [1622] system variable set larger than 1, if the next generated `AUTO_INCREMENT` value would be larger than the column's maximum value, the value would be clipped down to that maximum value and inserted, even if the resulting value would not be in the generated sequence. This could cause problems for master-master replication. Now the server clips the value down to the previous value in the sequence, which correctly produces a duplicate-key error if that value already exists in the column. (Bug #20524)
- **Replication**: `BIT` columns were not replicated properly under row-based replication. (Bug #22550)
- **Replication**: For row-based replication, log rotation could occur at an improper time. (Bug #21474)
- **Replication**: A race condition during slave server shutdown caused an assert failure. (Bug #20850)
- **Replication**: In mixed binary logging mode, a temporary switch from statement-based logging to row-based logging occurs when storing a row that uses a function such as `UUID()` [1042] into a temporary table. However, temporary table changes are not written to the binary log under row-

based logging, so the row does not exist on the slave. A subsequent select from the temporary table to a nontemporary table using statement-based logging works correctly on the master, but not on the slave where the row does not exist. Replication no longer switches back from row-based logging to statement-based logging until there are no temporary tables for the session. (Bug #20499)

- **Replication**: A redundant table map event could be generated in the binary log when there were no actual changes to a table being replicated. In addition, a slave failed to stop when attempting to replicate a table that did not exist on the slave. (Bug #18948)
- **Replication**: If a table on a slave server had a higher `AUTO_INCREMENT` counter than the corresponding master table (even though all rows of the two tables were identical), in some cases `REPLACE` or `INSERT ... ON DUPLICATE KEY UPDATE` would not replicate properly using statement-based logging. (Different values would be inserted on the master and slave.) (Bug #20188)
- **Replication**: The dropping of a temporary table whose name contained a backtick (`` ` ``) character was not correctly written to the binary log, which also caused it not to be replicated correctly. (Bug #19188)
- **Replication**: Row-based replication failed when the query cache was enabled on the slave. (Bug #17620)
- **Replication**: With row-based replication, replicating a statement to a slave where the table had additional columns relative to the master table did not work. (Bug #19069)
- **Replication**: Valgrind revealed an issue with `mysqld` that was corrected: memory corruption in replication slaves when switching databases. (Bug #19022)
- **Replication**: When using row based replication, a `CREATE TABLE ... SELECT` statement was replicated, even if the table creation failed on the master (for example, due to a duplicate key failure). (Bug #20265)
- **Replication**: A stored procedure that used `LAST_INSERT_ID()` [1036] did not replicate properly using statement-based binary logging. (Bug #20339)
- **Replication**: For row-based replication, the `BINLOG` statement did not lock tables properly, causing a crash for some table types. (Bug #19459)
- **Replication**: `CREATE PROCEDURE`, `CREATE FUNCTION`, `CREATE TRIGGER`, and `CREATE VIEW` statements containing multi-line comments (`/* ... */`) could not be replicated. (Bug #20438)
- **Replication**: The effect of a stored function or trigger that caused `AUTO_INCREMENT` values to be generated for multiple tables was not logged properly if statement-based logging was used. Only the first table's value was logged, causing replication to fail. Under mixed logging format, this is dealt with by switching to row-based logging for the function or trigger. For statement-based logging, this remains a problem. (Bug #19630)
- **Replication**: Compilation on Windows would fail if row based replication was disabled using `--without-row-based-replication`. (Bug #16837)
- **Replication**: Shutting down a slave in a replication scenario where temporary tables are in use would cause the slave to produce a core dump. (Bug #19881)
- **Replication**: Column names supplied for a view created on a master server could be lost on a slave server. (Bug #19419)
- **Replication**: An invalid `GRANT` statement for which `Ok` was returned on a replication master caused an error on the slave and replication to fail. (Bug #6774)
- **Disk Data**: Creating a tablespace and log file group, then attempting to restart the cluster without using the `--initial` option and without having created any Disk Data tables could cause a forced shutdown of the cluster and raise a configuration error. (Bug #21172)

- **Disk Data**: On some platforms, `ndbd` compiled with `gcc` 4 would crash when attempting to run `CREATE LOGFILE GROUP`. (Bug #21981)
- **Disk Data**: Errors could occur when dropping a data file during a node local checkpoint. (Bug #21710)
- **Disk Data**: Trying to create a Disk Data table using a nonexistent tablespace or to drop a nonexistent data file from a tablespace produced an uninformative error message. (Bug #21751)
- **Disk Data**: `mysqldump` did not back up tablespace or log file group information for Disk Data tables correctly.

  Specifically, `UNDO_BUFFER_SIZE` and `INITIAL_SIZE` values were misreported. This meant that trying to restore from such a backup would produce error 1296: `Got error 1504 'Out of logbuffer memory' from NDB`. (Bug #20809)
- **Disk Data**: `INFORMATION_SCHEMA.FILES` records for UNDO files showed incorrect values in the `EXTENT_SIZE`, `FREE_EXTENTS`, and `TOTAL_EXTENTS` columns. (Bug #20073)
- **Disk Data**: A data file created for one tablespace could be dropped using `ALTER TABLESPACE ... DROP DATAFILE` using a different tablespace. (Bug #20053)
- **Disk Data**: Trying to create Disk Data tables when running the cluster in diskless mode caused cluster data nodes to crash.

  Note

  Disk Data tables are now disabled when running in diskless mode.

  (Bug #20008)
- **Disk Data**: Running a large number of scans on Disk Data could cause subsequent scans to perform poorly. (Bug #20334)
- **Disk Data**: An issue with disk allocation could sometimes cause a forced shutdown of the cluster when running a mix of memory and Disk Data tables. (Bug #18780)
- **Disk Data**: The failure of a `CREATE TABLESPACE` or `CREATE LOGFILE GROUP` statement did not revert all changes made prior to the point of failure. (Bug #16341)
- **Cluster Replication**: One or more of the `mysqld` processes could fail when subjecting a Cluster replication setup with multiple `mysqld` processes on both the master and slave clusters to high loads. (Bug #19768)
- **Cluster API**: Invoking the MGM API function `ndb_mgm_listen_event()` caused a memory leak. (Bug #21671)
- **Cluster API**: The inclusion of `my_config.h` in `NdbApi.h` required anyone wishing to write NDB API applications against MySQL 5.1 to have a complete copy of the 5.1 sources. (Bug #21253)
- **Cluster API**: The `storage/ndb` directory was missing from the server binary distribution, making it impossible to compile `NDB` API and MGM API applications. This directory can be found as `/usr/include/storage/ndb` after installing that distribution. (Bug #21955)
- **Cluster API**: The `NdbOperation::getBlobHandle()` method, when called with the name of a nonexistent column, caused a segmentation fault. (Bug #21036)
- **Cluster API**: The MGM API function `ndb_logevent_get_fd()` was not implemented. (Bug #21129)
- **Cluster API**: `NdbScanOperation::readTuples()` and `NdbIndexScanOperation::readTuples()` ignored the *`batch`* parameter. (Bug #20252)

- The source distribution would not build on Windows due to a spurious dependency on `ib_config.h`. (Bug #22224)
- Memory overruns could occur for certain kinds of subqueries. (Bug #21477)
- Scheduled events that invoked stored procedures executing DDL operations on partitioned tables could crash the server. (Bug #20548)
- A query of the form shown here caused the server to crash:

```
SELECT * FROM t1 NATURAL JOIN (
    t2 JOIN (
        t3 NATURAL JOIN t4,
        t5 NATURAL JOIN t6
    )
    ON (t3.id3 = t2.id3 AND t5.id5 = t2.id5)
);
```

  (Bug #21007)
- The `SELECT` [627] privilege was required for an insert on a view, instead of the `INSERT` [627] privilege. (Bug #21261)

  References: This bug was introduced by Bug #20989.
- `mysql_upgrade` created temporary files in a possibly insecure way. (Bug #21224)
- Performing an `INSERT` on a view that was defined using a `SELECT` that specified a collation and a column alias caused the server to crash . (Bug #21086)
- If a column definition contained a character set declaration, but a `DEFAULT` value began with an introducer, the introducer character set was used as the column character set. (Bug #20695)
- Instance Manager had a race condition involving `mysqld` PID file removal. (Bug #22379)
- When records are merged from the insert buffer and the page needs to be reorganized, `InnoDB` used incorrect column length information when interpreting the records of the page. This caused a server crash due to apparent corruption of secondary indexes in `ROW_FORMAT=COMPACT` that contain prefix indexes of fixed-length columns. Data files should not be corrupted, but the crash was likely to repeat every time the server was restarted. (Bug #21638)
- An `InnoDB` mutex was not acquired and released under the same condition, leading to deadlock in some rare situations involving XA transactions. (Bug #21833)
- yaSSL had a conflicting definition for `socklen_t` on hurd-i386 systems. (Bug #22326)
- A query using `WHERE column = constant OR column IS NULL` did not return consistent results on successive invocations. The *`column`* in each part of the `WHERE` clause could be either the same column, or two different columns, for the effect to be observed. (Bug #21019)
- A subquery that uses an index for both the `WHERE` and `ORDER BY` clauses produced an empty result. (Bug #21180)
- The `fill_help_tables.sql` file did not contain a `SET NAMES 'utf8'` statement to indicate its encoding. This caused problems for some settings of the MySQL character set such as `big5`. (Bug #20551)
- Some Linux-x86_64-icc packages (of previous releases) mistakenly contained 32-bit binaries. Only `ICC` builds are affected, not `gcc` builds. Solaris and FreeBSD x86_64 builds are not affected. (Bug #22238)
- `INSERT DELAYED` did not honor `SET INSERT_ID` or the `auto_increment_*` system variables. (Bug #20627, Bug #20830)

- A query that used `GROUP BY` and an `ALL` or `ANY` quantified subquery in a `HAVING` clause could trigger an assertion failure. (Bug #21853)
- A buffer overwrite error in Instance Manager caused a crash. (Bug #20622)
- If the `auto_increment_offset` [1624] setting causes MySQL to generate a value larger than the column's maximum possible value, the `INSERT` statement is accepted in strict SQL mode, whereas but should fail with an error. (Bug #20573)
- When `DROP DATABASE` or `SHOW OPEN TABLES` was issued while concurrently in another connection issuing `DROP TABLE`, `RENAME TABLE`, `CREATE TABLE LIKE` or any other statement that required a name lock, the server crashed. (Bug #21216, Bug #19403)
- Using `EXPLAIN PARTITIONS` with a `UNION` query could crash the server. This could occur whether or not the query actually used any partitioned tables. (Bug #20484)
- For `INSERT ... ON DUPLICATE KEY UPDATE`, use of `VALUES(col_name)` [1044] within the `UPDATE` clause sometimes was handled incorrectly. (Bug #21555)
- A misleading error message was displayed when attempting to define a unique key that was not valid for a partitioned table. (Bug #21862)
- `UPGRADE` was treated as a reserved word, although it is not. (Bug #21772)
- `mysql_com.h` unnecessarily referred to the `ulong` type. (Bug #22227)
- `InnoDB` was slow with more than 100,000 `.idb` files. (Bug #21112)
- Some `ALTER TABLE` statements affecting a table's subpartitioning could hang. (Bug #21143)
- The server could crash for the second execution of a function containing a `SELECT` statement that uses an aggregating `IN` subquery. (Bug #21493)
- Valgrind revealed several issues with `mysqld` that were corrected: A dangling stack pointer being overwritten; possible uninitialized data in a string comparison; `syscall()` write parameter pointing to an uninitialized byte. (Bug #20579, Bug #20769, Bug #20783, Bug #20791)
- Subqueries with aggregate functions but no `FROM` clause could return incorrect results. (Bug #21540)
- `ALTER VIEW` did not retain existing values of attributes that had been originally specified but were not changed in the `ALTER VIEW` statement. (Bug #21080)
- Under heavy load (executing more than 1024 simultaneous complex queries), a problem in the code that handles internal temporary tables could lead to writing beyond allocated space and memory corruption.

  Use of more than 1024 simultaneous cursors server wide also could lead to memory corruption. This applies to both stored procedure cursors and C API cursors. (Bug #21206)
- A query result could be sorted improperly when using `ORDER BY` for the second table in a join. (Bug #21302)
- An `UPDATE` that referred to a key column in the `WHERE` clause and activated a trigger that modified the column resulted in a loop. (Bug #20670)
- If the binary logging format was changed between the times when a locked table was modified and when it was unlocked, the binary log contents were incorrect. (Bug #20863)
- Use of zero-length variable names caused a server crash. (Bug #20908)
- When `event_scheduler` [474] was set to `DISABLED`, its value was not displayed correctly by `SHOW VARIABLES` or `SELECT @@global.event_scheduler`. (Bug #22662)

- A `DATE` can be represented as an integer (such as `20060101`) or as a string (such as `'2006.01.01'`). When a `DATE` (or `TIME`) column is compared in one `SELECT` against both representations, constant propagation by the optimizer led to comparison of `DATE` as a string against `DATE` as an integer. This could result in integer comparisons such as `2006` against `20060101`, erroneously producing a false result. (Bug #21475)

- The `MD5()` [1030], `SHA1()` [1031], and `ENCRYPT()` [1030] functions should return a binary string, but the result sometimes was converted to the character set of the argument. `MAKE_SET()` [954] and `EXPORT_SET()` [952] now use the correct character set for their default separators, resulting in consistent result strings which can be coerced according to normal character set rules. (Bug #20536)

- The optimizer sometimes produced an incorrect row-count estimate after elimination of `const` [696] tables. This resulted in choosing extremely inefficient execution plans in same cases when distribution of data in joins were skewed. (Bug #21390)

- Searches against a `ZEROFILL` column of a partitioned table could fail when the `ZEROFILL` column was part of the table's partitioning key. (Bug #20733)

- `mysqldump` sometimes did not select the correct database before trying to dump views from it, resulting in an empty result set that caused `mysqldump` to die with a segmentation fault. (Bug #21014)

- The optimizer assumed that if `(a=x AND b=x)` is true, `(a=x AND b=x) AND a=b` is also true. But that is not always so if `a` and `b` have different data types. (Bug #21159)

- Certain malformed `INSERT` statements could crash the `mysql` client. (Bug #21142)

- `mysql_config --libmysqld-libs` did not produce any SSL options necessary for linking `libmysqld` with SSL support enabled. (Bug #21239)

- A `NUL` byte within a prepared statement string caused the rest of the string not to be written to the query log, permitting logging to be bypassed. (Bug #21813)

- Using `EXPLAIN PARTITIONS` with a query on a table whose partitioning expression was based on the value of a `DATE` column could sometimes cause the server to crash. (Bug #21339)

- Running `SHOW TABLE STATUS` on any `InnoDB` table having at least one record could crash the server. Note that this was not due to any issue in the `InnoDB` storage engine, but rather with `AUTO_INCREMENT` handling in the partitioning code—however, the table did not have to have an `AUTO_INCREMENT` column for the bug to manifest. (Bug #21173)

- Using `GROUP_CONCAT()` [1046] on the result of a subquery in the `FROM` clause that itself used `GROUP_CONCAT()` [1046] could cause a server crash. (Bug #22015)

- The feature of being able to recover a temporary table named `#sql_`*`id`* in `InnoDB` by creating a table named `rsql_`*`id`*`_recover_innodb_tmp_table` was broken by the introduction of the new identifier encoding in MySQL 5.1.6 (Bug #21313)

- `STR_TO_DATE()` [991] sometimes would return `NULL` if the `%D` format specifier was not the last specifier in the format string. (Bug #20987)

- When run with the `--use-threads` [309] option, `mysqlimport` returned a random exit code. (Bug #21188)

- For user-defined functions created with `CREATE FUNCTION`, the `DEFINER` clause is not legal, but no error was generated. (Bug #21269)

- Within stored routines, some error messages were printed incorrectly. A nonnull-terminated string was passed to a message-printing routine that expected a null-terminated string. (Bug #20778)

- With `query_cache_type` [514] set to 0, `RESET QUERY CACHE` was very slow and other threads were blocked during the operation. Now a cache reset is faster and nonblocking. (Bug #21051)

- Closing of temporary tables failed if binary logging was not enabled. (Bug #20919)
- For multiple `INSERT DELAYED` statements executed in a batch by the delayed-insert handler thread, not all rows were written to the binary log. (Bug #20821)
- Execution of a prepared statement that uses an `IN` subquery with aggregate functions in the `HAVING` clause could cause a server crash. (Bug #22085)
- A loaded storage engine plugin did not load after a server restart. (Bug #21610)
- The `fill_help_tables.sql` file did not load properly if the `ANSI_QUOTES` [572] SQL mode was enabled. (Bug #20542)
- Issuing a `SHOW CREATE FUNCTION` or `SHOW CREATE PROCEDURE` statement without sufficient privileges could crash the `mysql` client. (Bug #20664)
- The `myisam_stats_method` [503] variable was mishandled when set from an option file or on the command line. (Bug #21054)
- Selecting from `INFORMATION_SCHEMA.FILES` could crash the server. (Bug #21676)
- `INSERT ... SELECT` sometimes generated a spurious `Column count doesn't match value count` error. (Bug #21774)
- Adding `ORDER BY` to a `SELECT DISTINCT(expr)` query could produce incorrect results. (Bug #21456)
- `COUNT(*)` [1045] queries with `ORDER BY` and `LIMIT` could return the wrong result.

  Note

  This problem was introduced by the fix for Bug #9676, which limited the rows stored in a temporary table to the `LIMIT` clause. This optimization is not applicable to nongroup queries with aggregate functions. The current fix disables the optimization in such cases.

  (Bug #21787)
- A query using `WHERE NOT (column < ANY (subquery))` yielded a different result from the same query using the same *`column`* and *`subquery`* with `WHERE (column > ANY (subquery))`. (Bug #20975)
- Creating a `TEMPORARY` table with the same name as an existing table that was locked by another client could result in a lock conflict for `DROP TEMPORARY TABLE` because the server unnecessarily tried to acquire a name lock. (Bug #21096)
- On Windows, inserting into a `MERGE` table after renaming an underlying `MyISAM` table caused a server crash. (Bug #20789)
- Creation of a view as a join of views or tables could fail if the views or tables are in different databases. (Bug #20482)
- Subqueries on `INFORMATION_SCHEMA` tables could erroneously return an empty result. (Bug #21231)
- It was possible to provide the `ExtractValue()` [1016] function with input containing “tags” that were not valid XML; for example, it was possible to use tag names beginning with a digit, which are not permitted by the W3C's XML 1.0 specification. Such cases caused the function to return “junk” output rather than an error message signalling the user as to the true nature of the problem. (Bug #20854)
- `myisam_ftdump` produced bad counts for common words. (Bug #21459)
- Conversion of values inserted into a `BIT` column could affect adjacent columns. (Bug #22271)

- When creating a table using `CREATE...SELECT` and a stored procedure, there would be a mismatch between the binary log and transaction cache which would cause a server crash. (Bug #21039)
- The `CSV` storage engine failed to detect some table corruption. (Bug #22080)
- For certain queries, the server incorrectly resolved a reference to an aggregate function and crashed. (Bug #20868)
- Incorrect results could be obtained from re-execution of a parametrized prepared statement or a stored routine with a `SELECT` that uses `LEFT JOIN` with a second table having only one row. (Bug #21081)
- In a view defined with `SQL SECURITY DEFINER`, the `CURRENT_USER()` [1033] function returned the invoker, not the definer. (Bug #20570)
- `InnoDB` (Partitioning): Updating an `InnoDB` table using `HASH` partitioning with a composite primary key would cause the server to hang. (Bug #20852)
- Running `SHOW MASTER LOGS` at the same time as binary log files were being switched would cause `mysqld` to hang. (Bug #21965)
- For character sets having a `mbmaxlen` value of 2, any `ALTER TABLE` statement changed `TEXT` columns to `MEDIUMTEXT`. (Bug #21620)
- Database and table names have a maximum length of 64 characters (even if they contain multi-byte characters), but were truncated to 64 bytes.

  Note

  An additional fix was made in MySQL 5.1.18.

  (Bug #21432)
- `mysqldump` incorrectly tried to use `LOCK TABLES` for tables in the `INFORMATION_SCHEMA` database. (Bug #21527)
- For multiple-table `UPDATE` statements, storage engines were not notified of duplicate-key errors. (Bug #21381)
- A query selecting records from a single partition of a partitioned table and using `ORDER BY ic DESC` (where *`ic`* represents an indexed column) could cause errors or crash the server. (Bug #20583)
- Building `mysql` on Windows with `CMake` 2.4 failed to create `libmysqld` correctly. (Bug #20907)
- `ALTER EVENT` in the body of a stored procedure led to a crash when the procedure was called. This affected only those `ALTER EVENT` statements which changed the interval of the event. (Bug #22397)
- Using `ALTER TABLE ... REORGANIZE PARTITIONS` to reduce the number of subpartitions to 1 caused the server to crash. (Bug #21210)
- Merging multiple partitions having subpartitions into a single partition with subpartitions, or splitting a single partition having subpartitions into multiple partitions with subpartitions, could sometimes crash the server. These issues were associated with a failure reported in the `partition_range` test. (Bug #20767, Bug #20893, Bug #20766, Bug #21357)
- `mysql` crashed for very long arguments to the `connect` command. (Bug #21042)
- Using relative paths for `DATA DIRECTORY` or `INDEX DIRECTORY` with a partitioned table generated a warning rather than an error, and caused “junk” files to be created in the server's data directory. (Bug #21350)

- Performance during an import on a table with a trigger that called a stored procedure was severely degraded. (Bug #21013)
- Using aggregate functions in subqueries yielded incorrect results under certain circumstances due to incorrect application of `MIN()` [1047]/`MAX()` [1046] optimization. (Bug #20792)
- Deleting entries from a large `MyISAM` index could cause index corruption when it needed to shrink. Deletes from an index can happen when a record is deleted, when a key changes and must be moved, and when a key must be un-inserted because of a duplicate key. This can also happen in `REPAIR TABLE` when a duplicate key is found and in `myisamchk` when sorting the records by an index. (Bug #22384)
- If a partitioned `InnoDB` table contained an `AUTO_INCREMENT` column, a `SHOW` statement could cause an assertion failure with more than one connection. (Bug #20493)
- On 64-bit Windows, a missing table generated error 1017, not the correct value of 1146. (Bug #21396)
- Queries that used the `index_merge` [697] and `sort_union` methods to access an `InnoDB` table could produce inaccurate results. This issue was introduced in MySQL 5.1.10 when a new handler and bitmap interface was implemented. (Bug #21277)
- `SHOW INNODB STATUS` contained some duplicate output. (Bug #21113)
- `ALTER EVENT` statements including only a `COMMENT` clause failed with a syntax error on two platforms: Linux for S/390, and OS X 10.4 for 64-bit PowerPC. (Bug #23423)
- Users who had the `SHOW VIEW` [628] privilege for a view and privileges on one of the view's base tables could not see records in `INFORMATION_SCHEMA` tables relating to the base table. (Bug #20543)
- `mysql_upgrade` produced a malformed `upgrade_defaults` file by overwriting the `[client]` group header with a `password` option. This prevented `mysqlcheck` from running successfully when invoked by `mysql_upgrade`. (Bug #21011)
- The `--master-data` [298] option for `mysqldump` requires certain privileges, but `mysqldump` generated a truncated dump file without producing an appropriate error message or exit status if the invoking user did not have those privileges. (Bug #21215)
- Errors could be generated during the execution of certain prepared statements that ran queries on partitioned tables. (Bug #21658)
- Some prepared statements caused a server crash when executed a second time. (Bug #21166)
- Table aliases in multiple-table `DELETE` statements sometimes were not resolved. (Bug #21392)
- The `ExtractValue()` [1016] function did not accept XML tag names containing a period (`.`) character. (Bug #20795)
- Query results could be incorrect if the `WHERE` clause contained `t.key_part NOT IN (val_list)`, where `val_list` is a list of more than 1000 constants. (Bug #21282)
- Creating a partitioned table that used the `InnoDB` storage engine and then restarting `mysqld` with `--skip-innodb` [1359] caused MySQL to crash. (Bug #20871)
- After `FLUSH TABLES WITH READ LOCK` followed by `UNLOCK TABLES`, attempts to drop or alter a stored routine failed with an error that the routine did not exist, and attempts to execute the routine failed with a lock conflict error. (Bug #21414)
- Selecting from a `MERGE` table could result in a server crash if the underlying tables had fewer indexes than the `MERGE` table itself. (Bug #21617, Bug #22937)
- The presence of a subquery in the `ON` clause of a join in a view definition prevented the `MERGE` algorithm from being used for the view in cases where it should be permitted. (Bug #21646)

- The optimizer could make an incorrect index choice for indexes with a skewed key distribution. (Bug #22393)
- `mysqldump` did not add version-specific comments around `WITH PARSER` and `TABLESPACE ... STORAGE DISK` clauses for `CREATE TABLE` statements, causing dump files from servers where these features were in use to fail when loaded into older servers. (Bug #20841)
- `libmysqlclient` defined a symbol `BN_bin2bn` which belongs to OpenSSL. This could break applications that also linked against OpenSSL's `libcrypto` library. The fix required correcting an error in a build script that was failing to add rename macros for some functions. (Bug #21930)
- `character_set_results` [465] can be `NULL` to signify “no conversion,” but some code did not check for `NULL`, resulting in a server crash. (Bug #21913)
- With `max_sp_recursion` set to 0, a stored procedure that executed a `SHOW CREATE PROCEDURE` statement for itself triggered a recursion limit exceeded error, though the statement involves no recursion. (Bug #21416)
- Under certain circumstances, `AVG(key_val)` [1045] returned a value but `MAX(key_val)` [1046] returned an empty set due to incorrect application of `MIN()/MAX()` [1047] optimization. (Bug #20954)
- A function result in a comparison was replaced with a constant by the optimizer under some circumstances when this optimization was invalid. (Bug #21698)
- Using `DROP TABLE` with concurrent queries causes `mysqld` to crash. (Bug #21784)
- In the package of pre-built time zone tables that is available for download at http://dev.mysql.com/downloads/timezones.html, the tables now explicitly use the `utf8` character set so that they work the same way regardless of the system character set value. (Bug #21208)
- `REPLACE ... SELECT` for a view required the `INSERT` [627] privilege for tables other than the table being modified. (Bug #20989)
- Loading a plugin caused any an existing plugin with the same name to be lost. (Bug #20615)
- The URL into the online manual that is printed in the stack trace message by the server was out of date. (Bug #21449)
- It was possible for a stored routine with a non-`latin1` name to cause a stack overrun. (Bug #21311)
- A `SELECT` that used a subquery in the `FROM` clause that did not select from a table failed when the subquery was used in a join. (Bug #21002)
- `mysql` displayed an empty string for `NULL` values. (Bug #21618)
- `mysqldump` wrote an extra pair of `DROP DATABASE` and `CREATE DATABASE` statements if run with the `--add-drop-database` [293] option and the database contained views. (Bug #17201)
- Views created from prepared statements inside of stored procedures were created with a definition that included both `SQL_CACHE` and `SQL_NO_CACHE`. (Bug #17203)
- The `WITH CHECK OPTION` was not enforced when a `REPLACE` statement was executed against a view. (Bug #19789)
- `SUBSTRING()` [957] results sometimes were stored improperly into a temporary table when multi-byte character sets were used. (Bug #20204)
- Checking a `MyISAM` table (using `CHECK TABLE`) having a spatial index and only one row would wrongly indicate that the table was corrupted. (Bug #17877)
- Using `ALTER TABLE` on a subpartitioned table caused the server to crash. (Bug #19067)

- The server's handling of the number of partitions or subpartitions specified in a `PARTITIONS` or `SUBPARTITIONS` clause was changed. Beginning with this release, the number of partitions must:
  - be a positive, nonzero integer
  - not have any leading zeros
  - not be an expression

  Also beginning with this version, no attempt is made to convert, truncate, or evaluate a `PARTITIONS` or `SUBPARTITIONS` value; instead, the `CREATE TABLE` or `ALTER TABLE` statement containing the `PARTITIONS` or `SUBPARTITIONS` clause now fails with an appropriate error message. (Bug #15890)
- User names have a maximum length of 16 characters (even if they contain multi-byte characters), but were being truncated to 16 bytes. (Bug #20393)
- Race conditions on certain platforms could cause the Instance Manager to fail to initialize. (Bug #19391)
- When `NOW()` [990] was used in a `BETWEEN` [941] clause of the definition for a view, it was replaced with a constant in the view. (Bug #15950)
- Incorrect type aggregation for `IN()` [942] and `CASE` [946] expressions could lead to an incorrect result. (Bug #18360)
- Use of `MIN()` [1047] or `MAX()` [1046] with `GROUP BY` on a `ucs2` column could cause a server crash. (Bug #20076)
- Multiple-table `DELETE` statements containing a subquery that selected from one of the tables being modified caused a server crash. (Bug #19225)
- `PROCEDURE ANALYSE()` returned incorrect values of *`M`* `FLOAT(`*`M, D`*`)` and `DOUBLE(`*`M, D`*`)`. (Bug #20305)
- If a file name was specified for the `--log` [430] or `--log-slow-queries` [433] options but the server was logging to tables and not files, the server produced no error message. (Bug #17599)
- `SELECT` statements using `GROUP BY` against a view could have missing columns in the output when there was a trigger defined on one of the base tables for the view. (Bug #20466)
- For a `MyISAM` table with a `FULLTEXT` index, compression with `myisampack` or a check with `myisamchk` after compression resulted in table corruption. (Bug #19702)
- Instance Manager didn't close the client socket file when starting a new `mysqld` instance. `mysqld` inherited the socket, causing clients connected to Instance Manager to hang. (Bug #12751)
- Concatenating the results of multiple constant subselects produced incorrect results. (Bug #16716)
- `mysqld --flush` failed to flush `MyISAM` table changes to disk following an `UPDATE` statement for which no updated column had an index. (Bug #20060)
- The thread for `INSERT DELAYED` rows was maintaining a separate `AUTO_INCREMENT` counter, resulting in incorrect values being assigned if `DELAYED` and non-`DELAYED` inserts were mixed. (Bug #20195)
- For statements that have a `DEFINER` clause such as `CREATE TRIGGER` or `CREATE VIEW`, long user names or host names could cause a buffer overflow. (Bug #16899)
- File size specifications for `InnoDB` data files were case sensitive. (Bug #19609)
- RPM packages had spurious dependencies on Perl modules and other programs. (Bug #13634)
- Selecting data from a `MEMORY` table with a `VARCHAR` column and a `HASH` index over it returned only the first row matched. (Bug #18233)

- Use of the `--no-pager` [263] option caused `mysql` to crash. (Bug #19363)
- Portions of statements related to partitioning were not surrounded by version-specific comments by `mysqldump`, breaking backward compatibility for dump files. (Bug #19488)
- Triggers on tables in the `mysql` database caused a server crash. Triggers for tables in this database are no longer permitted. (Bug #18361, Bug #18005)
- Defining a table partitioned by `LIST` with a single `PARTITION ... VALUES IN (NULL)` clause could lead to server crashes, particularly with queries having `WHERE` conditions comparing the partitioning key with a constant. (Bug #20268, Bug #19801)
- `TIMESTAMPDIFF()` [994] examined only the date and ignored the time when the requested difference unit was months or quarters. (Bug #16226)
- Some server errors were not reported to the client, causing both to try to read from the connection until a hang or crash resulted. (Bug #16581)
- The binary log lacked character set information for table names when dropping temporary tables. (Bug #14157)
- A prepared statement that altered partitioned table within a stored procedure failed with the error `Unknown prepared statement handler`. (Bug #17138)
- The source distribution failed to compile when configured with the `--without-geometry` option. (Bug #12991)
- `AUTHORS` and `CONTRIBUTORS` were not treated as reserved words. (Bug #19939)
- `ALTER TABLE` on a table created prior to 5.0.3 would cause table corruption if the `ALTER TABLE` did one of the following:
  - Change the default value of a column.
  - Change the table comment.
  - Change the table password.

  (Bug #17001)
- For a reference to a nonexistent index in `FORCE INDEX`, the error message referred to a column, not an index. (Bug #17873)
- `DATE_ADD()` [983] and `DATE_SUB()` [986] returned `NULL` when the result date was on the day `'9999-12-31'`. (Bug #12356)
- Queries on tables that were partitioned by `KEY` and had a `VARCHAR` column as the partitioning key produced an empty result set. (Bug #20086)
- When using tables containing `VARCHAR` columns created under MySQL 4.1 with a 5.0 or later server, for some queries the metadata sent to the client could have an empty column name. (Bug #14897)
- Attempting to insert a string of greater than 4096 bytes into a `FEDERATED` table resulted in the error `ERROR 1296 (HY000) at line 2: Got error 10000 'Error on remote system: 1054: Unknown column 'string-value' from FEDERATED`. This error was raised regardless of the type of column involved (`VARCHAR`, `TEXT`, and so on.) (Bug #17608)
- `ALTER TABLE ... COALESCE PARTITION` did not delete the files associated with the partitions that were removed. (Bug #19305)
- `InnoDB`: Quoted Unicode identifiers were not handled correctly. This included names of tables, columns, and foreign keys. (Bug #18800)

- For connections that required a SUBJECT value, a check was performed to verify that the value was correct, but the connection was not refused if not. (Bug #20411)
- InnoDB locking was improved by removing a gap lock for the case that you try to delete the same row twice within a transaction. (Bug #13544)
- Using cursors with READ COMMITTED [1224] isolation level could cause InnoDB to crash. (Bug #19834)
- FEDERATED tables raised invalid duplicate key errors when attempting on one server to insert rows having the same primary key values as rows that had been deleted from the linked table on the other server. (Bug #18764)
- For a DATE parameter sent using a MYSQL_TIME data structure, mysql_stmt_execute() zeroed the hour, minute, and second members of the structure rather than treating them as read only. (Bug #20152)
- An ALTER TABLE operation that does not need to copy data, when executed on a table created prior to MySQL 4.0.25, could result in a server crash for subsequent accesses to the table. (Bug #19192)
- Grant table modifications sometimes did not refresh the in-memory tables if the host name was '' or not specified. (Bug #16297)
- FLUSH TABLES followed by a LOCK TABLES statement to lock a log table and a nonlog table caused an infinite loop and high CPU use. Now FLUSH TABLES ignores log tables. To flush the log tables, use FLUSH LOGS instead. (Bug #20139)
- When used in the DO clause of a CREATE EVENT statement, the statements CREATE EVENT, CREATE FUNCTION, and CREATE PROCEDURE caused the server to crash. (These statements are not permitted inside CREATE EVENT.) (Bug #18896, Bug #16409)
- InnoDB unlocked its data directory before committing a transaction, potentially resulting in nonrecoverable tables if a server crash occurred before the commit. (Bug #19727)
- Linking the pthreads library to single-threaded MySQL libraries caused dlopen() to fail at runtime on HP-UX. (Bug #18267)
- The --collation-server [422] server option was being ignored. With the fix, if you choose a nondefault character set with --character-set-server [422], you should also use --collation-server [422] to specify the collation. (Bug #15276)
- On Mac OS X, zero-byte read() or write() calls to an SMB-mounted file system could return a nonstandard return value, leading to data corruption. Now such calls are avoided. (Bug #12620)
- A scheduled event that took longer to execute than the length of time scheduled between successive executions could “skip” executions. For example, an event defined with EVERY 1 SECOND—but which required longer than 1 second to complete—might be executed only once every 2 seconds. (Bug #16417)
- Partitions were represented internally as the wrong data type, which led in some cases to failures of queries such as SELECT COUNT(*) FROM INFORMATION_SCHEMA.PARTITIONS WHERE PARTITION_NAME = '*partition_name*'. (Bug #20340)
- Memory used by scheduled events was not freed when the events were dropped. (Bug #18683)
- CHECK TABLE on a MyISAM table briefly cleared its AUTO_INCREMENT value, while holding only a read lock. Concurrent inserts to that table could use the wrong AUTO_INCREMENT value. CHECK TABLE no longer modifies the AUTO_INCREMENT value. (Bug #19604)
- On Windows, a definition for mysql_set_server_option() was missing from the C client library. (Bug #16513)

- Invalid escape sequences in option files caused MySQL programs that read them to abort. (Bug #15328)
- When a statement is executed that does not generate any rows, an extra table map event and associated binrows event would be generated and written to the binary log. (Bug #19995)
- Queries using an indexed column as the argument for the `MIN()` [1047] and `MAX()` [1046] functions following an `ALTER TABLE .. DISABLE KEYS` statement returned `Got error 124 from storage engine` until `ALTER TABLE ... ENABLE KEYS` was run on the table. (Bug #20357)
- The character set was not being properly initialized for `CAST()` [1012] with a type such as `CHAR(2) BINARY`, which resulted in incorrect results or a server crash. (Bug #17903)
- Prepared statements caused general log and server memory corruption. (Bug #14346)
- For `SELECT ... FOR UPDATE` statements that used `DISTINCT` or `GROUP BY` over all key parts of a unique index (or primary key), the optimizer unnecessarily created a temporary table, thus losing the linkage to the underlying unique index values. This caused a `Result set not updatable` error. (The temporary table is unnecessary because under these circumstances the distinct or grouped columns must also be unique.) (Bug #16458)
- Some queries using `ORDER BY ... DESC` on subpartitioned tables could crash the server. (Bug #20389)
- A subselect used in the `ON SCHEDULE` clause of a `CREATE EVENT` or `ALTER EVENT` statement caused the server to crash, rather than producing an error as expected. (Bug #16394)
- `N'xxx'` and `_utf8'xxx'` were not treated as equivalent because `N'xxx'` failed to unescape backslashes (`\`) and doubled apostrophe/single quote characters (`''`). (Bug #17313)
- In MySQL 5.1.11, the `--with-openssl` and `--with-yassl` options were replaced by `--with-ssl`. But no message was issued if the old options were given. Now `configure` produces a message indicating that the new option should be used and exits. (Bug #20002)
- The use of `MIN()` [1047] and `MAX()` [1046] on columns with an index prefix produced incorrect results in some queries. (Bug #18206)
- When performing a `GROUP_CONCAT()` [1046], the server transformed `BLOB` columns `VARCHAR` columns, which could cause erroneous results when using Connector/J and possibly other MySQL APIs. (Bug #16712)
- `EXPLAIN PARTITIONS` would produce illegible output in the `partitions` column if the length of text to be displayed in that column was too long. This could occur when very many partitions were defined for the table, partitions were given very long names, or due to a combination of the two. (Bug #19684)
- Race conditions on certain platforms could cause the Instance Manager to try to restart the same instance multiple times. (Bug #18023)
- Running `InnoDB` with many concurrent threads could cause memory corruption and a seg fault due to a bug introduced in MySQL 5.1.11. (Bug #20213)
- Using `ALTER TABLE ... ENGINE = x`, where *x* was not a storage engine supported by the server, would cause `mysqld` to crash. (Bug #20397)
- `CREATE DATABASE`, `RENAME DATABASE`, and `DROP DATABASE` could deadlock in cases where there was a global read lock. (Bug #19815)
- Some yaSSL public function names conflicted with those from OpenSSL, causing conflicts for applications that linked against both OpenSSL and a version of `libmysqlclient` that was built with yaSSL support. The yaSSL public functions now are renamed to avoid this conflict. (Bug #19575)

- Long multiple-row `INSERT` statements could take a very long time for some multi-byte character sets. (Bug #15811)
- In the `INFORMATION_SCHEMA.FILES` table, the `INITIAL_SIZE`, `MAXIMUM_SIZE`, and `AUTOEXTEND_SIZE` columns incorrectly were being stored as `VARCHAR` rather than `BIGINT`. . (Bug #19544)
- `InnoDB` failed to increment the `handler_read_prev` counter. (Bug #19542)
- Using the extended syntax for `TRIM()` [958]—that is, `TRIM(... FROM ...)` [958]—in a `SELECT` statement defining a view caused an invalid syntax error when selecting from the view. (Bug #17526)
- An invalid comparison between keys with index prefixes over multi-byte character fields could lead to incorrect result sets if the selected query execution plan used a range scan by an index prefix over a `UTF8` character field. This also caused incorrect results under similar circumstances with many other character sets. (Bug #14896)
- When not running in strict mode, the server failed to convert the invalid years portion of a `DATE` or `DATETIME` value to `'0000'` when inserting it into a table.

  Note

  This fix was reverted in MySQL 5.1.18.

  (Bug #19370)

  References: See also Bug #25301.
- The implementation for `UNCOMPRESS()` [1031] did not indicate that it could return `NULL`, causing the optimizer to do the wrong thing. (Bug #18539)
- For `BOOLEAN` mode full-text searches on nonindexed columns, `NULL` rows generated by a `LEFT JOIN` caused incorrect query results. (Bug #14708, Bug #25637)
- An update that used a join of a table to itself and modified the table on both sides of the join reported the table as crashed. (Bug #18036)
- The `MD5()` [1030] and `SHA()` [1031] functions treat their arguments as case-sensitive strings. But when they are compared, their arguments were compared as case-insensitive strings, which leads to two function calls with different arguments (and thus different results) compared as being identical. This can lead to a wrong decision made in the range optimizer and thus to an incorrect result set. (Bug #15351)
- Using `SELECT` and a table join while running a concurrent `INSERT` operation would join incorrect rows. (Bug #14400)
- The `ENGINE` clause was displayed in the output of `SHOW CREATE TABLE` for partitioned tables when the SQL mode included `no_table_options`. (Bug #19695)
- Updating a column of a `FEDERATED` table to `NULL` sometimes failed. (Bug #16494)
- A `SELECT` with a subquery that was bound to the outer query over multiple columns returned different results when a constant was used instead of one of the dependant columns. (Bug #18925)
- Values greater than 2 gigabytes used in the VALUES LESS THAN clause of a table partitioned by RANGE were treated as negative numbers. (Bug #16002)
- The source distribution failed to compile when configured with the `--with-libwrap` option. (Bug #18246)
- Identifiers with embedded escape characters were not handled correctly by some `SHOW` statements due to some old code that was doing some extra unescaping. (Bug #19874)

- If the general log table reached a large enough file size (27GB), `SELECT COUNT(*)` on the table caused a server crash. (Bug #17589)
- Identifiers could not contain bytes with a value of 255, though that should be permitted as of the identifier-encoding changes made in MySQL 5.1.6. (Bug #18396)
- When setting a column to its implicit default value as the result of inserting a `NULL` into a `NOT NULL` column as part of a multi-row insert or `LOAD DATA` operation, the server returned a misleading warning message. (Bug #14770)
- Re-execution of a prepared multiple-table `DELETE` statement that involves a trigger or stored function can result in a server crash. (Bug #19634)
- The optimizer did not take advantage of indexes on columns used for the second or third arguments of `BETWEEN` [941]. (Bug #18165)
- On Windows, corrected a crash stemming from differences in Visual C runtime library routines from POSIX behavior regarding invalid file descriptors. (Bug #18275)
- `mysqlslap` did not enable the `CLIENT_MULTI_RESULTS` flag when connecting, which is necessary for executing stored procedures. (Bug #20365)
- A `B-TREE` index on a `MEMORY` table erroneously reported duplicate entry error for multiple `NULL` values. (Bug #12873)
- Using tables from MySQL 4.x in MySQL 5.x, in particular those with `VARCHAR` fields and using `INSERT DELAYED` to update data in the table would result in either data corruption or a server crash. (Bug #16218, Bug #17294, Bug #16611)
- `mysqldump` produced a malformed dump file when dumping multiple databases that contained views. (Bug #20221)
- The value returned by a stored function returning a string value was not of the declared character set. (Bug #16211)
- The `PASSWORD()` [1030] function returned invalid results when used in some `UNION` queries. (Bug #16881)
- The yaSSL library bundled with `libmysqlclient` had some conflicts with OpenSSL. Now macros are used to rename the conflicting symbols to have a prefix of `ya`. (Bug #19810)
- Renaming a database to itself caused a server crash. (Bug #19392)
- `perror` crashed on Solaris due to `NULL` return value of `strerror()` system call. (Bug #20145)
- A `CREATE TABLE` that produced a `The PARTITION function returns the wrong type` error also caused an `Incorrect information in file` to be printed to `STDERR`, and a junk file to be left in the database directory. (Bug #16000)
- The `--default-storage-engine` [425] server option did not work. (Bug #20168)
- Multiple calls to a stored procedure that altered a partitioned `MyISAM` table would cause the server to crash. (Bug #19309)
- The server crashed if it tried to access a `CSV` table for which the data file had been removed. (Bug #15205)
- The MySQL server startup script `/etc/init.d/mysql` (created from `mysql.server`) is now marked to ensure that the system services `ypbind`, `nscd`, `ldap`, and `NTP` are started first (if these are configured on the machine). (Bug #18810)
- `ORDER BY RAND() LIMIT 1` always set a user variable to the last possible value from the table. (Bug #16861)

- It is possible to create `MERGE` tables into which data cannot be inserted (by not specifying a `UNION` clause. However, when an insert was attempted, the error message was confusing. Now an error occurs indicating that the table is read only. (Bug #17766)
- For `mysql`, escaping with backslash sometimes did not work. (Bug #20103)
- When executing a `SELECT` with `ORDER BY` on a view that is constructed from a `SELECT` statement containing a stored function, the stored function was evaluated too many times. (Bug #19862)
- A stored procedure that created and invoked a prepared statement was not executed when called in a mysqld init-file. (Bug #17843)
- The `mysql_list_fields()` C API function returned the incorrect table name for views. (Bug #19671)
- If the files for an open table were removed at the OS level (external to the server), the server exited with an assertion failure. (Bug #16532)
- The parser rejected queries that selected from a table twice using a `UNION` within a subquery. The parser now supports arbitrary subquery, join, and parenthesis operations within `EXISTS` subqueries. A limitation still exists for scalar subqueries: If the subquery contains `UNION`, the first `SELECT` of the `UNION` cannot be within parentheses. For example, `SELECT (SELECT a FROM t1 UNION SELECT b FROM t2)` will work, but `SELECT ((SELECT a FROM t1) UNION (SELECT b FROM t2))` will not. (Bug #14654)
- Assignments of values to variables of type `TEXT` were handled incorrectly in stored routines. (Bug #17225)
- Multiple-table updates with `FEDERATED` tables could cause a server crash. (Bug #19773)
- When a statement used a stored function that inserted into an `AUTO_INCREMENT` column, the generated `AUTO_INCREMENT` value was not written into the binary log, so a different value could in some cases be inserted on the slave. (Bug #20341)
- Join conditions using index prefixes on `utf8` columns of `InnoDB` tables incorrectly ignored rows where the length of the actual value was greater than the length of the index prefix. (Bug #19960)
- For a `MyISAM` table locked with `LOCK TABLES ...WRITE`, queries optimized using the `index_merge` [697] method did not show rows inserted with the lock in place. (Bug #20256)
- It was possible using `ALTER EVENT ... RENAME ...` to move an event to a database on which the user did not have the `EVENT` [626] privilege. (Bug #18897)
- An issue with yaSSL prevented Connector/J clients from connecting to the server using a certificate. (Bug #19705)
- The `max_length` metadata value for columns created from `CONCAT()` [951] could be incorrect when the collation of an argument differed from the collation of the `CONCAT()` [951] itself. In some contexts such as `UNION`, this could lead to truncation of the column contents. (Bug #15962)
- A subquery in the `WHERE` clause of the outer query and using `IN` and `GROUP BY` returned an incorrect result. (Bug #16255)
- `mysqlimport` sends a `set @@character_set_database=binary` statement to the server, but this is not understood by pre-4.1 servers. Now `mysqlimport` encloses the statement within a `/*! 40101 ... */` comment so that old servers will ignore it. (Bug #15690)
- If a query had a condition of the form *`tableX.key = tableY.key`*, which participated in equality propagation and also was used for `ref` [697] access, then early `ref` [697]-access `NULL` filtering was not performed for the condition. This could make query execution slower. (Bug #19649)
- `mysql_upgrade` was missing from binary MySQL distributions. (Bug #20403, Bug #18516, Bug #20556)

- On Linux, `libmysqlclient` when compiled with yaSSL using the `icc` compiler had a spurious dependency on C++ libraries. (Bug #20119)
- Nested natural joins worked executed correctly when executed as a nonprepared statement could fail with an `Unknown column 'col_name' in 'field list'` error when executed as a prepared statement, due to a name resolution problem. (Bug #15355)
- Re-executing a stored procedure with a complex stored procedure cursor query could lead to a server crash. (Bug #15217)
- `REPLACE` statements caused activation of `UPDATE` triggers, not `DELETE` and `INSERT` triggers. (Bug #13479)
- Trying to execute a query having a `WHERE` clause using `int_col = "string_value" OR int_col IS NULL` on a partitioned table whose partitioning or subpartitioning function used the integer column `int_col` would crash the server. (Bug #19055)
- The `index_merge` [697]/`Intersection` optimizer could experience a memory overrun when the number of table columns covered by an index was sufficiently large, possibly resulting in a server crash. (Bug #16201)
- Referring to a stored function qualified with the name of one database and tables in another database caused a “table doesn't exist” error. (Bug #18444)
- Use of the `--prompt` option or `prompt` command caused `mysql` to be unable to connect to the Instance Manager. (Bug #17485)
- Intermediate tables created during the execution of an `ALTER TABLE` statement were visible in the output of `SHOW TABLES`. (Bug #18775)
- `mysqldump` would not dump views that had become invalid because a table named in the view definition had been dropped. Instead, it quit with an error message. Now you can specify the `--force` option to cause `mysqldump` to keep going and write an SQL comment containing the view definition to the dump output. (Bug #17371)
- The C API failed to return a status message when invoking a stored procedure. (Bug #15752)
- Stored procedures did not use the character set defined for the database in which they were created. (Bug #16676)
- Row equalities (such as `WHERE (a,b) = (c,d)` were not taken into account by the optimizer, resulting in slow query execution. Now they are treated as conjunctions of equalities between row elements. (Bug #16081)
- `BIN()` [950], `OCT()` [955], and `CONV()` [972] did not work with BIT values. (Bug #15583)
- A number of dependency issues in the RPM `bench` and `test` packages caused installation of these packages to fail. (Bug #20078)
- With settings of `read_buffer_size` [516] >= 2G and `read_rnd_buffer_size` [518] >=2G, `LOAD DATA INFILE` failed with no error message or caused a server crash for files larger than 2GB. (Bug #12982)
- For an `ENUM` column that used the `ucs2` character set, using `ALTER TABLE` to modify the column definition caused the default value to be lost. (Bug #20108)
- Partition pruning could cause incorrect results from queries, such missing rows, when the partitioning expression relied on a `BIGINT UNSIGNED` column. (Bug #20257)
- `BIT` columns in a table could cause joins that use the table to fail. (Bug #18895)
- Some memory leaks in the `libmysqld` embedded server were corrected. (Bug #16017)

- `OPTIMIZE TABLE` and `REPAIR TABLE` yielded incorrect messages or warnings when used on partitioned tables. (Bug #17455)
- `libmysqld` produced some warnings to `stderr` which could not be silenced. These warnings now are suppressed. (Bug #13717)
- On Windows, terminating `mysqld` with **Control+C** could result in a crash during shutdown. (Bug #18235)
- Setting `myisam_repair_threads` [502] caused any repair operation on a `MyISAM` table to fail to update the cardinality of indexes, instead making them always equal to 1. (Bug #18874)
- Repeated `DROP TABLE` statements in a stored procedure could sometimes cause the server to crash. (Bug #19399)
- Performing `INSERT ... SELECT ... JOIN ... USING` without qualifying the column names caused `ERROR 1052 "column 'x' in field list is ambiguous"` even in cases where the column references were unambiguous. (Bug #18080)
- The length of the pattern string prefix for `LIKE` operations was calculated incorrectly for multi-byte character sets. As a result, the scanned range was wider than necessary if the prefix contained any multi-byte characters, and rows could be missing from the result set. (Bug #18359, Bug #16674)
- Adding an index to a partitioned table that had been created using `AUTO_INCREMENT = value` caused the `AUTO_INCREMENT` value to be reset. (Bug #19281)
- `ALTER TABLE ... REBUILD PARTITION` could cause the server to hang or crash. (Bug #19122)
- A query could produce different results with and without and index, if the `WHERE` clause contained a range condition that used an invalid `DATETIME` constant. (Bug #16249)
- On 64-bit systems, use of the `cp1250` character set with a primary key column in a `LIKE` clause caused a server crash for patterns having letters in the range 128..255. (Bug #19741)
- For table-format output, `mysql` did not always calculate columns widths correctly for columns containing multi-byte characters in the column name or contents. (Bug #17939)
- The build process incorrectly tried to overwrite `sql/lex_hash.h`. This caused the build to fail when using a shadow link tree pointing to original sources that were owned by another account. (Bug #18888)
- Following a failed attempt to add an index to an `ARCHIVE` table, it was no longer possible to drop the database in which the table had been created. (Bug #17310)
- Using `SELECT` on a corrupt `MyISAM` table using the dynamic record format could cause a server crash. (Bug #19835)
- `SHOW GRANTS FOR CURRENT_USER` did not return definer grants when executed in `DEFINER` context (such as within a stored procedure defined with `SQL SECURITY DEFINER`), it returned the invoker grants. (Bug #15298)
- Some user-level errors were being written to the server's error log, which is for server errors. (Bug #20402)
- The `query` command for `mysqltest` did not work. (Bug #19890)
- `make install` tried to build files that should already have been built by `make all`, causing a failure if installation was performed using a different account than the one used for the initial build. (Bug #19738)
- Changing the definition of a `DECIMAL` column with `ALTER TABLE` caused loss of column values. (Bug #18014)

- The final parenthesis of a `CREATE INDEX` statement occurring in a stored procedure was omitted from the binary log when the stored procedure was called. (Bug #19207)
- A cast problem caused incorrect results for prepared statements that returned float values when MySQL was compiled with `gcc` 4.0. (Bug #19694)
- `mysqlcheck` tried to check views instead of ignoring them. (Bug #16502)
- A `UNION` over more than 128 `SELECT` statements that use an aggregate function failed. (Bug #18175)
- A `Table ... doesn't exist` error could occur for statements that called a function defined in another database. (Bug #17199)
- Queries containing a subquery that used aggregate functions could return incorrect results. (Bug #16792)
- For a table having `LINEAR HASH` subpartitions, the `LINEAR` keyword did not appear in the `SUBPARTITION_METHOD` column of the `INFORMATION_SCHEMA.PARTITIONS` table. (Bug #20161)
- `DELETE` with `LEFT JOIN` for `InnoDB` tables could crash the server if `innodb_locks_unsafe_for_binlog` [1372] was enabled. (Bug #15650)
- `myisam_ftdump` would fail when trying to open a MyISAM index file that you did not have write permissions to access, even though the command would only be reading from the file. (Bug #17122)
- SSL connections using yaSSL on OpenBSD could fail. (Bug #19191)
- The optimizer could produce an incorrect result after `AND` with collations such as `latin1_german2_ci`, `utf8_czech_ci`, and `utf8_lithuanian_ci`. (Bug #9509)
- A locking safety check in `InnoDB` reported a spurious error `stored_select_lock_type is 0 inside ::start_stmt()` for `INSERT ... SELECT` statements in `innodb_locks_unsafe_for_binlog` [1372] mode. The safety check was removed. (Bug #10746)
- The `DATA DIRECTORY` table option did not work for `TEMPORARY` tables. (Bug #8706)
- For very complex `SELECT` statements could create temporary tables that were too large, and for which the temporary files were not removed, causing subsequent queries to fail. (Bug #11824)
- For ODBC compatibility, MySQL supports use of `WHERE col_name IS NULL` for `DATE` or `DATETIME` columns that are `NOT NULL`, to permit column values of `'0000-00-00'` or `'0000-00-00 00:00:00'` to be selected. However, this was not working for `WHERE` clauses in `DELETE` statements. (Bug #8143)
- With `TRADITIONAL` [578] SQL mode, assignment of out-of-bound values and rounding of assigned values was done correctly, but assignment of the same numbers represented as strings sometimes was handled differently. (Bug #6147)
- `USE` did not refresh database privileges when employed to re-select the current database. (Bug #10979)
- `INSERT INTO ... SELECT ... LIMIT 1` could be slow because the `LIMIT` was ignored when selecting candidate rows. (Bug #9676)
- The type of the value returned by the `VARIANCE()` [1048] function varied according to the type of the input value. The function should always return a `DOUBLE` value. (Bug #10966)
- The `--with-collation` [135] option was not honored for client connections. (Bug #7192)
- A server or network failure with an open client connection would cause the client to hang even though the server was no longer available.

As a result of this change, the `MYSQL_OPT_READ_TIMEOUT` and `MYSQL_OPT_WRITE_TIMEOUT` options for `mysql_options()` now apply to TCP/IP connections on all platforms. Previously, they applied only to Windows. (Bug #9678)

- A user variable set to a value selected from an unsigned column was stored as a signed value. (Bug #7498)
- A stored procedure with a `CONTINUE` handler that encountered an error continued to execute a statement that caused an error, rather with the next statement following the one that caused the error. (Bug #8153)
- `CREATE USER` did not respect the 16-character user name limit. (Bug #10668)
- `EXPLAIN` sometimes returned an incorrect `select_type` for a `SELECT` from a view, compared to the `select_type` for the equivalent `SELECT` from the base table. (Bug #5500)
- On an `INSERT` into an updatable but noninsertable view, an error message was issued stating that the view was not updatable. Now the message says the view is not insertable-into. (Bug #5505)
- The server returns a more informative error message when it attempts to open a `MERGE` table that has been defined to use non-`MyISAM` tables. (Bug #10974)
- Some queries that used `ORDER BY` and `LIMIT` performed quickly in MySQL 3.23, but slowly in MySQL 4.x/5.x due to an optimizer problem. (Bug #4981)
- The same trigger error message was produced under two conditions: The trigger duplicated an existing trigger name, or the trigger duplicated an existing combination of action and event. Now different messages are produced for the two conditions so as to be more informative. (Bug #10946)
- After an `INSERT ... ON DUPLICATE KEY UPDATE` statement that updated an existing row, `LAST_INSERT_ID()` [1036] could return a value not in the table. (Bug #11460)
- Incorporated portability fixes into the definition of `__attribute__` in `my_global.h`. (Bug #2717)
- User-created tables having a name beginning with `#sql` were not visible to `SHOW TABLES` and could collide with internal temporary table names. Now they are not hidden and do not collide. (Bug #1405)

Changes in MySQL 5.1.11 (2006-05-26)

This is a new Beta development release, fixing recently discovered bugs.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details, please see http://www.mysql.com/products/enterprise.

Functionality Added or Changed

- **Incompatible Change**: The Event Scheduler can now be in one of three states (on, off, or the new suspended state). In addition, due to the fact that `SET GLOBAL event_scheduler;` now acts in a synchronous rather than asynchronous manner, the Event Scheduler thread can be no longer be activated or deactivated at run time.

  For more information regarding these changes, see Event Scheduler Overview. (Bug #17619)
- **MySQL Cluster**: The limit of 2048 ordered indexes per cluster has been lifted. There is now no upper limit on the number of ordered indexes (including `AUTO_INCREMENT` columns) that may be used. (Bug #14509)
- The `ENABLE KEYS` and `DISABLE KEYS` clauses for the `ALTER TABLE` statement are now supported for partitioned tables. (Bug #19502)
- Added the `log_queries_not_using_indexes` [490] system variable. (Bug #19616)

- Added the `--ssl-verify-server-cert` [658] option to MySQL client programs. This option causes the server's Common Name value in its certificate to be verified against the host name used when connecting to the server, and the connection is rejected if there is a mismatch. Added `MYSQL_OPT_SSL_VERIFY_SERVER_CERT` option for the `mysql_options()` C API function to enable this verification. This feature can be used to prevent man-in-the-middle attacks. Verification is disabled by default. (Bug #17208)

- Added the `ssl_ca` [527], `ssl_capath` [527], `ssl_cert` [527], `ssl_cipher` [528], and `ssl_key` [528] system variables, which display the values given using the corresponding command options. See SSL Command Options. (Bug #19606)

- Added the `--angel-pid-file` option to `mysqlmanager` for specifying the file in which the angel process records its process ID when `mysqlmanager` runs in daemon mode. (Bug #14106)

- It is now possible to use `NEW.var_name` values within triggers as `INOUT` parameters to stored procedures. (Bug #14635)

- The default for the `innodb_thread_concurrency` [1383] system variable was changed to `8`. (Bug #15868)

- `mysql_explain_log` (a third-party program) is no longer included in MySQL distributions.

- The `mysql_get_ssl_cipher()` C API function was added.

- Previously, to build MySQL from source with SSL support enabled, you would invoke `configure` with either the `--with-openssl` or `--with-yassl` option. Those options both have been replaced by the `--with-ssl` option. By default, `--with-ssl` causes the bundled yaSSL library to be used. To select OpenSSL instead, give the option as `--with-ssl=path` , where `path` is the directory where the OpenSSL header files and libraries are located.

Bugs Fixed

- **Security Fix**: An SQL-injection security hole has been found in multi-byte encoding processing. The bug was in the server, incorrectly parsing the string escaped with the `mysql_real_escape_string()` C API function.

  This vulnerability was discovered and reported by Josh Berkus `<josh@postgresql.org>` and Tom Lane `<tgl@sss.pgh.pa.us>` as part of the inter-project security collaboration of the OSDB consortium. For more information about SQL injection, please see the following text.

  Discussion. An SQL injection security hole has been found in multi-byte encoding processing. An SQL injection security hole can include a situation whereby when a user supplied data to be inserted into a database, the user might inject SQL statements into the data that the server will execute. With regards to this vulnerability, when character set-unaware escaping is used (for example, `addslashes()` in PHP), it is possible to bypass the escaping in some multi-byte character sets (for example, SJIS, BIG5 and GBK). As a result, a function such as `addslashes()` is not able to prevent SQL-injection attacks. It is impossible to fix this on the server side. The best solution is for applications to use character set-aware escaping offered by a function such `mysql_real_escape_string()`.

  However, a bug was detected in how the MySQL server parses the output of `mysql_real_escape_string()`. As a result, even when the character set-aware function `mysql_real_escape_string()` was used, SQL injection was possible. This bug has been fixed.

  Workarounds. If you are unable to upgrade MySQL to a version that includes the fix for the bug in `mysql_real_escape_string()` parsing, but run MySQL 5.0.1 or higher, you can use the `NO_BACKSLASH_ESCAPES` [573] SQL mode as a workaround. (This mode was introduced in MySQL 5.0.1.) `NO_BACKSLASH_ESCAPES` [573] enables an SQL standard compatibility mode, where backslash is not considered a special character. The result will be that queries will fail.

  To set this mode for the current connection, enter the following SQL statement:

```
SET sql_mode='NO_BACKSLASH_ESCAPES';
```

You can also set the mode globally for all clients:

```
SET GLOBAL sql_mode='NO_BACKSLASH_ESCAPES';
```

This SQL mode also can be enabled automatically when the server starts by using the command-line option `--sql-mode=NO_BACKSLASH_ESCAPES` [446] or by setting `sql-mode=NO_BACKSLASH_ESCAPES` in the server option file (for example, `my.cnf` or `my.ini`, depending on your system). (Bug #8378, CVE-2006-2753)

References: See also Bug #8303.

- **Partitioning**: **MySQL Cluster**: `SELECT MIN(unique_column)` from a Cluster table with user-defined partitioning crashed the server. (Bug #18730)
- **MySQL Cluster**: **Replication**: (Replication): Memory was not freed after some `ALTER TABLE` operations, which could cause `mysqld` processes to crash. (Bug #19885)
- **MySQL Cluster**: `ALTER TABLE ENGINE=...` failed when used to change a MySQL Cluster table having no explicit primary key to use a different storage engine.

  Note

  As a consequence of this fix, `SHOW CREATE TABLE` no longer displays auto-partitioning information for `NDBCLUSTER` tables.

  (Bug #19010)
- **MySQL Cluster**: Running `ALL START` in the `NDB` management client or restarting multiple nodes simultaneously could under some circumstances cause the cluster to crash. (Bug #19930)
- **MySQL Cluster**: Using “stale” `mysqld .frm` files could cause a newly restored cluster to fail. This situation could arise when restarting a MySQL Cluster using the `--initial` option while leaving connected `mysqld` processes running. (Bug #16875)
- **MySQL Cluster**: A Cluster whose storage nodes were installed from the `MySQL-ndb-storage-*` RPMs could not perform `CREATE` or `ALTER` operations that made use of nondefault character sets or collations. (Bug #14918)
- **MySQL Cluster**: Data node failures could cause excessive CPU usage by `ndb_mgmd`. (Bug #13987)
- **MySQL Cluster**: `TRUNCATE TABLE` failed on tables having `BLOB` or `TEXT` columns with the error `Lock wait timeout exceeded`.

  Note

  This issue affected both in-memory and Disk Data tables.

  (Bug #19201)
- **Replication**: The embedded server crashed with row-based replication enabled. (Bug #18518)
- **Cluster Replication**: `mysqld` processes did not always detect cluster shutdown, leading to issues with Cluster replication and schema distribution. (Bug #19395)
- **Cluster API**: The `Ndb::dropEventOperation()` method failed to clean up all objects used, which could cause memory leaks to occur. (Bug #17610)
- **Cluster API**: On big-endian platforms, `NdbOperation::write_attr()` did not update 32-bit fields correctly. (Bug #19537)

- When creating a table using `CREATE TABLE ... PARTITION BY ... SELECT ...`, the partitioning clause was ignored. (Bug #19062)
- Adding an index to a table created using partitioning by `KEY` and the `MEMORY` storage engine caused the server to crash. (Bug #19140)
- A `CREATE TABLE` statement that created a table from a materialized view did not inherit default values from the underlying table. (Bug #19089)
- `EXPLAIN ... SELECT INTO` caused the client to hang. (Bug #15463)
- `BLOB` or `TEXT` arguments to or values returned from stored functions were not copied properly if too long and could become garbled. (Bug #18587)
- The result from `CONV()` [972] is a string, but was not always treated the same way as a string when converted to a real value for an arithmetic operation. (Bug #13975)
- `IS_USED_LOCK()` [1042] could return an incorrect connection identifier. (Bug #16501)
- The server no longer uses a signal handler for signal 0 because it could cause a crash on some platforms. (Bug #15869)
- The `Data_free` column in the output of `SHOW TABLE STATUS` always displayed 0 for partitioned tables. (Bug #19501)
- Altering a `VARCHAR` column in a `MyISAM` table to make it longer could cause corruption of the following column. (Bug #19386)
- Revised memory allocation for local objects within stored functions and triggers to avoid memory leak for repeated function or trigger invocation. (Bug #17260)
- Returning the value of a system variable from a stored function caused a server crash. (Bug #18037)
- Display better error message for `ALTER TABLE` operations that will result in duplicate keys due to `AUTO_INCREMENT` resequencing. (Bug #14573)
- Symlinking `.mysql_history` to `/dev/null` to suppress statement history saving by `mysql` did not work. (`mysql` deleted the symlink and recreated `.mysql_history` as a regular file, and then wrote history to it.) (Bug #16803)
- Concurrent reading and writing of privilege structures could crash the server. (Bug #16372)
- In was not possible to invoke a stored routine containing dynamic SQL from a scheduled event. (Bug #19264)
- Simultaneous scheduled events whose actions conflicted with one another could crash the server. (Bug #16428)
- The client libraries were not compiled for position-independent code on Solaris-SPARC and AMD x86_64 platforms. (Bug #18091, Bug #13159, Bug #14202)
- For dates with 4-digit year parts less than 200, an implicit conversion to add a century was applied for date arithmetic performed with `DATE_ADD()` [983], `DATE_SUB()` [986], `+ INTERVAL`, and `- INTERVAL`. (For example, `DATE_ADD('0050-01-01 00:00:00', INTERVAL 0 SECOND)` [983] became `'2050-01-01 00:00:00'`.) Now these operations return `NULL` rather than an incorrect non-`NULL` value. (Bug #18997)
- Use of uninitialized user variables in a subquery in the `FROM` clause resulted in invalid entries in the binary log. (Bug #19136)
- Premature optimization of nested subqueries in the `FROM` clause that refer to aggregate functions could lead to incorrect results. (Bug #19077)

- `CREATE TABLE ... SELECT ...` statements that used a stored function explicitly or implicitly (through a view) resulted in a `Table not locked` error. (Bug #15137, Bug #12472)
- Corrected several problems with the treatment of the `--log-error` [242] option by `mysqld_safe`. These problems were manifest as differences from `mysqld` in error log handling.
  - If a file name was given for `--log-error` [242], `mysqld_safe` ignored it and did not pass it to `mysqld`, which then wrote error information to `stderr` and resulted in incorrect log rotation when `FLUSH LOGS` was used.
  - `mysql_safe` now adds `.err` to the end of the file name if no extension is present (the same as `mysqld`).
  - `mysqld_safe` treated a relative path name as relative to its own current working directory. Now it treats a relative path name as relative to the data directory (the same as `mysqld`).

  In addition, some argument quoting problems were corrected. (Bug #6061)
- Within a trigger, `SET` statements used the SQL mode of the invoking statement, not the mode in effect at trigger creation time. (Bug #6951)
- The `basedir` [463] and `tmpdir` [534] system variables could not be accessed using *`@@var_name`* syntax. (Bug #1039)
- The patch for Bug #8303 broke the fix for Bug #8378 and was reverted.

  In string literals with an escape character (`\`) followed by a multi-byte character that had (`\`) as its second byte, the literal was not interpreted correctly. Now only next byte now is escaped, and not the entire multi-byte character. This means it is a strict reverse of the `mysql_real_escape_string()` function.
- If a file name was given for `--log-error` [242], `mysqld_safe` ignored it and did not pass it to `mysqld`, which then wrote error information to `stderr` and resulted in incorrect log rotation when `FLUSH LOGS` was used.
- `mysql_safe` now adds `.err` to the end of the file name if no extension is present (the same as `mysqld`).
- `mysqld_safe` treated a relative path name as relative to its own current working directory. Now it treats a relative path name as relative to the data directory (the same as `mysqld`).

Changes in MySQL 5.1.10 (Not released)

Note

This was an internal release only, and no binaries were published.

MySQL 5.1.10 includes the patches for recently reported security vulnerabilities in the MySQL client/server protocol. We would like to thank Stefano Di Paola `<stefano.dipaola@wisec.it>` for finding and reporting these to us.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details, please see http://www.mysql.com/products/enterprise.

Functionality Added or Changed

- **Security Enhancement**: Added the global `max_prepared_stmt_count` [497] system variable to limit the total number of prepared statements in the server. This limits the potential for denial-of-service attacks based on running the server out of memory by preparing huge

numbers of statements. The current number of prepared statements is available through the `prepared_stmt_count` [511] system variable. (Bug #16365)

- **MySQL Cluster**: It is now possible to perform a partial start of a cluster. That is, it is now possible to bring up the cluster without first running `ndbd --initial` on all configured data nodes. (Bug #18606)
- **MySQL Cluster**: It is now possible to restore a MySQL Cluster backup between big-endian and little-endian machines. (Bug #19255)
- **MySQL Cluster**: It is now possible to install MySQL with Cluster support to a nondefault location and change the search path for font description files using either the `--basedir` [418] or `--character-sets-dir` [421] options. (Previously in MySQL 5.1, `ndbd` searched only the default path for character sets.)
- **Packaging**: The `MySQL-shared-compat-5.1.X-.i386.rpm` shared compatibility RPMs no longer contain libraries for MySQL 5.0. This avoids a conflict because the 5.0 and 5.1 libraries share the same `soname` number. They now contain libraries for MySQL 3.23, 4.0, 4.1, and 5.1. (Bug #19288)
- You must now have the `DROP` [626] privilege to drop table partitions. (Bug #17139)
- On Windows, some names such as `nul`, `prn`, and `aux` could not be used as file names because they are reserved as device names. These are now permissible names in MySQL. They are encoded by appending `@@@` to the name when the server creates the corresponding file or directory. This occurs on all platforms for portability of the corresponding database object between platforms. (Bug #17870)
- XPath expressions passed to the `ExtractValue()` [1016] and `UpdateXML()` [1018] functions can now include the colon character (“`:`”). This enables use of these functions with XML which employs namespaces. (Bug #18170)
- Server and clients ignored the `--sysconfdir` option that was passed to `configure`. The directory specified by this option, if set, now is used as one of the standard locations in which to look for option files. (Bug #15069)
- In result set metadata, the `MYSQL_FIELD.length` value for `BIT` columns now is reported in number of bits. For example, the value for a `BIT(9)` column is 9. (Formerly, the value was related to number of bytes.) (Bug #13601)
- The bundled yaSSL library was upgraded to version 1.3.5. This improves handling of certain problems with SSL-related command options. (Bug #17737)
- The `ONLY_FULL_GROUP_BY` [575] SQL mode now also applies to the `HAVING` clause. That is, columns not named in the `GROUP BY` clause cannot be used in the `HAVING` clause if not used in an aggregate function. (Bug #18739)
- SQL syntax for prepared statements now supports `ANALYZE TABLE`, `OPTIMIZE TABLE`, and `REPAIR TABLE`. (Bug #19308)
- Binary distributions that include SSL support now are built using yaSSL when possible.
- Added `--debug` [366] option to Instance Manager.
- Added the `have_dynamic_loading` [479] system variable that indicates whether the server supports dynamic loading of plugins.
- Added the `REFERENTIAL_CONSTRAINTS` table to `INFORMATION_SCHEMA`. It provides information about foreign keys.
- The `mysql_upgrade` command has been converted from a shell script to a C program, so it is available on non-Unix systems such as Windows. This program should be run for each MySQL upgrade. See `mysql_upgrade` — Check and Upgrade MySQL Tables.

- Added the `sql_big_selects` [524] system variable to the output of `SHOW VARIABLES`.
- Added the `KEY_BLOCK_SIZE` table option and index option. This can be used in `CREATE TABLE`, `ALTER TABLE`, and `CREATE INDEX` statements to provide a hint to the storage engine about the size to use for index key blocks. The engine is permitted to change the value if necessary.
- The following statements now cause an implicit commit: `ANALYZE TABLE`, `CHECK TABLE`, `OPTIMIZE TABLE`, and `REPAIR TABLE`.

Bugs Fixed

- **Security Fix**: A `NUL` byte within a comment in a statement string caused the rest of the string not to be written to the query log, permitting logging to be bypassed. (Bug #17667, CVE-2006-0903)
- **Security Fix**: A malicious client, using specially crafted invalid login or `COM_TABLE_DUMP` packets was able to read uninitialized memory, which potentially, though unlikely in MySQL, could have led to an information disclosure. (,) Thanks to Stefano Di Paola `<stefano.dipaola@wisec.it>` for finding and reporting this bug. (CVE-2006-1516, CVE-2006-1517)
- **Security Fix**: A malicious client, using specially crafted invalid `COM_TABLE_DUMP` packets was able to trigger an exploitable buffer overflow on the server. Thanks to Stefano Di Paola `<stefano.dipaola@wisec.it>` for finding and reporting this bug. (CVE-2006-1518)
- **MySQL Cluster**: **Replication**: (Replication): Delete and update of rows in a table without a primary key failed on the slave. (Bug #17400)
- **MySQL Cluster**: Repeated use of the `SHOW` and `ALL STATUS` commands in the `ndb_mgm` client could cause the `mgmd` process to crash. (Bug #18591)
- **MySQL Cluster**: In a 2-node cluster with a node failure, restarting the node with a low value for `StartPartialTimeout` [1835] could cause the cluster to come up partitioned (“split-brain” issue).

  A similar issue could occur when the cluster was first started with a sufficiently low value for this parameter. (Bug #16447, Bug #18612)
- **MySQL Cluster**: (Disk Data): `CREATE LOGFILE GROUP` accepted values other than `NDB` or `NDBCLUSTER` in the `ENGINE` clause. (Bug #18604)
- **MySQL Cluster**: A simultaneous `DROP TABLE` and table update operation utilising a table scan could trigger a node failure. (Bug #18597)
- **MySQL Cluster**: A 5.1.6 or newer server did not read local checkpoints recorded by any other 5.1 version, thus preventing a system restart following an upgrade. (Bug #19333)
- **MySQL Cluster**: (Disk Data): Running an `INSERT` and a `DELETE` on a Disk Data table in the same transaction could cause a deadlock. (Bug #19244)
- **MySQL Cluster**: `mysqldump` included in its output data from the internal `cluster` database. (Bug #17840)
- **MySQL Cluster**: On slow networks or CPUs, the management client `SHOW` command could sometimes erroneously show all data nodes as being master nodes belonging to nodegroup 0. (Bug #15530)
- **MySQL Cluster**: The Cluster binlog `mysqld` accepted updates even though the binary log was not set up, which could lead to updates missing from the binary log. (Bug #18932)
- **MySQL Cluster**: Queries using `ORDER BY` *`pkN`* failed against a `LIST`-partitioned Cluster table having a multi-column primary key, where *`pkN`* represents one of the columns making up the primary key. (Bug #18598)
- **MySQL Cluster**: `ndbd` sometimes failed to start with the error `Node failure handling not completed` following a graceful restart. (Bug #18550)

- **MySQL Cluster**: Performing multiple `ALTER TABLE` operations on the same `NDB` table from different `mysqld` processes in the same cluster led to schema versioning errors when trying to access the table again following the restart of one of the `mysqld` processes. (Bug #16445)
- **MySQL Cluster**: (Disk Data): Omitting the required `ENGINE` clause from a `CREATE LOGFILE GROUP` or `CREATE TABLESPACE` statement caused the server to crash. An appropriate error message is now returned instead. (Bug #18603)
- **MySQL Cluster**: Stopping multiple nodes could cause node failure handling not to be completed. (Bug #19039)
- **MySQL Cluster**: `mysql-test-run.pl` started `NDB` even for test cases that did not need it. (Bug #19083)
- **MySQL Cluster**: Starting `mysqld` without `--log-bin` [1647] caused DDL statements on `NDB` tables to time out. (Bug #19214)
- **MySQL Cluster**: An `INSERT` or `UPDATE` of more than 128 bytes of data in a 4-replica cluster could cause data nodes to crash. (Bug #18622)
- **MySQL Cluster**: `ndb_restore` failed to restore a backup made from a 5.0 cluster to a 5.1 cluster. (Bug #18210)
- **MySQL Cluster**: Some queries having a `WHERE` clause of the form `c1=val1 OR c2 LIKE 'val2'` were not evaluated correctly. (Bug #17421)
- **MySQL Cluster**: `mysqld` could crash when attempting an update if the cluster had failed previously. (Bug #18798)
- **MySQL Cluster**: Fragment IDs were not logged correctly, causing `ndb_restore_log` to fail. (Bug #18594)
- **MySQL Cluster**: Backups could fail for large clusters with many tables, where the number of tables approached `MaxNoOfTables` [1829]. (Bug #17607)
- **MySQL Cluster**: An issue with `ndb_mgmd` prevented more than 27 `mysqld` processes from connecting to a single cluster at one time. (Bug #17150)
- **MySQL Cluster**: Unused open handlers for tables in which the metadata had changed were not properly closed. This could result in stale results from `NDB` tables following an `ALTER TABLE` statement. (Bug #13228)
- **MySQL Cluster**: On systems with multiple network interfaces, data nodes would get “stuck” in startup phase 2 if the interface connecting them to the management server was working on node startup while the interface interconnecting the data nodes experienced a temporary outage. (Bug #15695)
- **MySQL Cluster**: Concurrent `INSERT` and `ROLLBACK` statements from different connections could cause node failures. (Bug #19245)
- **MySQL Cluster**: A `SELECT` from an `NDB` table with `ORDER BY` *`indexed_column`* and a `LIMIT` clause would fail following `ALTER TABLE`. (Bug #18094)
- **MySQL Cluster**: Adding an index to an unsigned integer column did not work correctly. (Bug #18133)
- **MySQL Cluster**: Uninitialized internal variables could lead to unexpected results. (Bug #11033, Bug #11034)
- **MySQL Cluster**: When attempting to create an index on a `BIT` or `BLOB` column, `Error 743: Unsupported character set in table or index` was returned instead of `Error 906: Unsupported attribute type in index`.

- **Cluster Replication**: **Partitioning**: Attempting to create an index using multiple columns on an explicitly partitioned table in a replicated Cluster database could cause the master `mysqld` process to crash. (Bug #18284)
- **Cluster Replication**: **Replication**: An issue with replication caused a `mysqld` connected to a replicated cluster to crash when entering single user mode. (Bug #18535)
- **Replication**: `CREATE VIEW` statements would not be replicated to the slave if the `--replicate-wild-ignore-table` [1638] rule was enabled. (Bug #18715)
- **Replication**: Updating a field value when also requesting a lock with `GET_LOCK()` [1040] would cause slave servers in a replication environment to terminate. (Bug #17284)
- **Replication**: The binary log would create an incorrect `DROP` query when creating temporary tables during replication. (Bug #17263)
- **Disk Data**: Concurrent table schema operations and operations on log file groups, tablespaces, data files, or undo files could lead to data node failures. (Bug #18575)
- **Disk Data**: Issuing a `CREATE LOGFILE GROUP` statement during the drop of an `NDB` table would cause database corruption. (Bug #19141)
- **Cluster Replication**: Trying to restore the `apply_status` table from a 5.0 cluster backup failed on a 5.1 server. (Bug #18935)
- **Cluster Replication**: Using the `--binlog-do-db` [1649] option caused problems with `CREATE TABLE` on the cluster acting as the replication master. (Bug #19492)
- **Cluster Replication**: When taking part in Cluster replication of tables containing `BLOB` columns, `mysqld` falsely reported a large memory leak in the replication buffers when there was none. (Bug #19247)
- **Cluster API**: Passing a nonexistent index name to `NdbIndexScanOperation::setBound()` caused a segmentation fault. (Bug #19088)
- Running `myisampack` followed by `myisamchk` with the `--unpack` [330] option would corrupt the `AUTO_INCREMENT` key. (Bug #12633)
- A view definition that referred to an alias in the `HAVING` clause could be saved in the `.frm` file with the alias replaced by the expression that it referred to, causing failure of subsequent `SELECT * FROM` *`view_name`* statements. (Bug #19573)
- The `ExtractValue()` [1016] function failed with a syntax error when the XPath expression used special characters such as `Ñ` (“N-tilde”). (Bug #16233)
- Delimited identifiers for partitions were not being treated the same as delimited identifiers for other database objects (such as tables and columns) with regard to permitted characters. (Bug #18750)
- The `sql_big_selects` [524] system variable was not displayed by `SHOW VARIABLES`. (Bug #17849)
- Conversion of a number to a `CHAR UNICODE` string returned an invalid result. (Bug #18691)
- Instance Manager now finds the version numbers, so that it works properly when the executable name isn't the same as what the Instance Manager launched (such as when wrapping a `libtool`-wrapped executable from the source tree). (Bug #19059)
- Running an `ALTER TABLE` on a partitioned table simultaneously experiencing a high number of concurrent DML statements could crash the server. (Bug #18572)
- Inserts failed with duplicate key errors on a table partitioned using an `AUTO_INCREMENT` column for the partitioning key. (Bug #18753, Bug #18552)

- `mysqltest` incorrectly interpreted some `ER_xxx` error names given in the `error` command. (Bug #18495)
- If the second or third argument to `BETWEEN` [941] was a constant expression such as `'2005-09-01 - INTERVAL 6 MONTH` and the other two arguments were columns, `BETWEEN` [941] was evaluated incorrectly. (Bug #18618)
- An issue with file handling in the partitioning code could cause `mysqld` to crash when started and then stopped within a very short period of time. (Bug #19313)
- If the server were built without partition support, it was possible to run partitioning-related statements with no errors or warnings, even though these statements would have no effect. Now such statements are not permitted unless the server has been compiled using the `--with-partition` option. (Bug #15561)
- `LOAD DATA FROM MASTER` would fail when trying to load the `INFORMATION_SCHEMA` database from the master, because the `INFORMATION_SCHEMA` system database would already exist on the slave. (Bug #18607)
- `InnoDB` failure to release an adaptive hash index latch could cause a server crash if the query cache was enabled. (Bug #15758)
- Some fast `ALTER TABLE` operations (requiring no temporary table) did not work for all tables. (Bug #19011)
- After calling `FLUSH STATUS`, the `max_used_connections` variable did not increment for existing connections and connections which use the thread cache. (Bug #15933)
- The parser leaked memory when its stack needed to be extended. (Bug #18930)
- A `LOCK TABLES` statement that failed could cause `MyISAM` not to update table statistics properly, causing a subsequent `CHECK TABLE` to report table corruption. (Bug #18544)
- For single-`SELECT` union constructs of the form (SELECT ... ORDER BY *`order_list1`* [LIMIT *`n`*]) ORDER BY *`order_list2`*, the `ORDER BY` lists were concatenated and the `LIMIT` clause was ignored. (Bug #18767)
- An outer join of two views that was written using `{ OJ ... }` syntax could cause a server crash. (Bug #19396)
- `InnoDB`: A `DELETE` followed by an `INSERT` and then by an `UPDATE` on a partitioned `InnoDB` table caused subsequent queries to return incorrect results. (Bug #17992)
- Use of `CONVERT_TZ()` [981] in a view definition could result in spurious syntax or access errors. (Bug #15153)
- Eliminated some memory corruption problems that resultsd in `double free or corruption` errors and a server crash. (Bug #19154)
- Logging to the `mysql.general_log` and `mysql.slow_log` tables did not work for Windows builds because the `CSV` storage engine was unavailable. The `CSV` engine now is enabled in Windows builds. (Bug #17368)
- `InnoDB` did not use a consistent read for `CREATE ... SELECT` when `innodb_locks_unsafe_for_binlog` [1372] was set. (Bug #18350)
- If the first argument to `BETWEEN` [941] was a `DATE` or `TIME` column of a view and the other arguments were constants, `BETWEEN` [941] did not perform conversion of the constants to the appropriate temporary type, resulting in incorrect evaluation. (Bug #16069)
- The presence of multiple equalities in a condition after reading a constant table could cause the optimizer not to use an index. This resulted in certain queries being much slower than in MySQL 4.1. (Bug #16504)

- Some outer joins were incorrectly converted to inner joins. (Bug #19816)

  References: This bug was introduced by Bug #17146.

- Index corruption could occur in cases when `key_cache_block_size` [485] was not a multiple of the `myisam-block-size` [436] value (for example, with `--key_cache_block_size=1536` [485] and `--myisam-block-size=1024` [436]). (Bug #19079)

- `InnoDB` could read a delete mark from its system tables incorrectly. (Bug #19217)

- In `mysqltest`, `--sleep=0` had no effect. Now it correctly causes `sleep` commands in test case files to sleep for 0 seconds. (Bug #18312)

- It was possible to use trailing spaces in the names of partitions and subpartitions. Attempting to do so now raises the error `Incorrect partition name`. (Bug #17973)

- The XPath `string-length()` function was not implemented for use with `ExtractValue()` [1016]. (Bug #16319)

- A compatibility issue with NPTL (Native POSIX Thread Library) on Linux could result in a deadlock with `FLUSH TABLES WITH READ LOCK` under some conditions. (Bug #20048)

- Prevent recursive views caused by using `RENAME TABLE` on a view after creating it. (Bug #14308)

- `MyISAM` table deadlock was possible if one thread issued a `LOCK TABLES` request for write locks and then an administrative statement such as `OPTIMIZE TABLE`, if between the two statements another client meanwhile issued a multiple-table `SELECT` for some of the locked tables. (Bug #16986)

- Executing a `CREATE EVENT` statement could cause 100% CPU usage. (Bug #19170)

- Casting a string to `DECIMAL` worked, but casting a trimmed string (using `LTRIM()` [954] or `RTRIM()` [956]) resulted in loss of decimal digits. (Bug #17043)

- `InnoDB`: `ALTER TABLE` to add or drop a foreign key for an `InnoDB` table had no effect. (Bug #18477)

- `LAST_INSERT_ID()` [1036] in a stored function or trigger returned zero. . (Bug #15728)

- `SELECT DISTINCT` queries sometimes returned only the last row. (Bug #18068)

- The server attempted to flush uninitialized log tables during `SIGHUP` processing, causing a crash. (Bug #18848)

- Attempting to set the default value of an `ENUM` or `SET` column to `NULL` caused a server crash. (Bug #19145)

- Event-creation statements enclosed in multi-line comments using `/*!version_number ... */` syntax were not parsed correctly. (Bug #18078)

- The `sql_notes` [526] and `sql_warnings` [527] system variables were not always displayed correctly by `SHOW VARIABLES` (for example, they were displayed as `ON` after being set to `OFF`). (Bug #16195)

- A query on a table partitioned or subpartitioned by `HASH` did not display all results when using a `WHERE` condition involving a column used in the hashing expression. (Bug #18329, Bug #18423)

- `ALTER TABLE ... REBUILD PARTITION` returned an inaccurate error message. (Bug #16819)

- If the `WHERE` condition of a query contained an `OR`-ed `FALSE` term, the set of tables whose rows cannot serve for null-complements in outer joins was determined incorrectly. This resulted in blocking possible conversions of outer joins into joins by the optimizer for such queries. (Bug #17164)

- MySQL would not compile on Linux distributions that use the `tinfo` library. (Bug #18912)

- Avoid trying to include `<asm/atomic.h>` when it doesn't work in C++ code. (Bug #13621)
- `DROP DATABASE` did not drop stored routines associated with the database if the database name was longer than 21 characters. (Bug #18344)
- Executing `SELECT` on a large table that had been compressed within `myisampack` could cause a crash. (Bug #17917)
- Updates to a `MEMORY` table caused the size of `BTREE` indexes for the table to increase. (Bug #18160)
- A range access optimizer heuristic was invalid, causing some queries to be much slower in MySQL 5.0 than in 4.0. (Bug #17379, Bug #18940)
- For a reference to a nonexistent stored function in a stored routine that had a `CONTINUE` handler, the server continued as though a useful result had been returned, possibly resulting in a server crash. (Bug #18787)
- A recent change caused the `mysql` client not to display `NULL` values correctly and to display numeric columns left-justified rather than right-justified. The problems have been corrected. (Bug #18265)
- The `ExtractValue()` [1016] function did not return character data within `<![CDATA[]]>` as expected. (Bug #18285)
- `mysql` displayed `NULL` for strings that are empty or contain only spaces. (Bug #19564)
- `DELETE` and `UPDATE` statements that used large `NOT IN (value_list)` clauses could use large amounts of memory. (Bug #15872)
- It was possible to create a `RANGE`-partitioned table with a partition defined using the clause `VALUES LESS THAN (NULL)`, even though such a partition could never contain any values whatsoever. (Bug #18752)
- A failed `ALTER TABLE` operation could fail to clean up a temporary `.frm` file. (Bug #18129)
- `myisamchk` and `myisam_ftdump` should permit either table names or `.MYI` file names as arguments, but permitted only table names. (Bug #19220)
- Use of `--default-storage-engine=innodb` [425] resulted in an error with the server reporting that `InnoDB` was an unknown table type. (Bug #16691)
- `LIKE` searches failed on a `CHAR` column used as the partitioning column of a table partitioned by `KEY`. (Bug #17946)
- Creating a table in an `InnoDB` database with a column name that matched the name of an internal `InnoDB` column (including `DB_ROW_ID`, `DB_TRX_ID`, `DB_ROLL_PTR` and `DB_MIX_ID`) would cause a crash. MySQL now returns Error 1005 `Cannot create table` with `errno` set to -1. (Bug #18934)
- Within a trigger, `CONNECTION_ID()` [1033] did not return the connection ID of the thread that caused the trigger to be activated. (Bug #16461)
- Some queries were slower in 5.0 than in 4.1 because some 4.1 cost-evaluation code had not been merged into 5.0. (Bug #14292)
- `REPAIR TABLE` did not restore the length for packed keys in tables created under MySQL 4.x, which caused them to appear corrupt to `CHECK TABLE` but not to `REPAIR TABLE`. (Bug #17810)
- Successive `ALTER TABLE ... DROP PARTITION` statements on the same subpartitioned table could eventually cause the server to crash. (Bug #18962)
- `MySQL-shared-compat-5.1.9-0.i386.rpm` incorrectly depended on `glibc` 2.3 and could not be installed on a `glibc` 2.2 system. (Bug #16539)
- Selecting from a view that used `GROUP BY` on a nonconstant temporal interval (such as `DATE(col) + INTERVAL TIME_TO_SEC(col) SECOND` could cause a server crash. (Bug #19490)

- The `system_time_zone` [529] and `version_*` system variables could not be accessed using `SELECT @@var_name` syntax. (Bug #15684, Bug #12792)
- Use of `CONVERT_TZ()` [981] in a stored function or trigger (or in a stored procedure called from a stored function or trigger) caused an error. (Bug #11081)
- When `myisamchk` needed to rebuild a table, `AUTO_INCREMENT` information was lost. (Bug #10405)

Changes in MySQL 5.1.9 (2006-04-12)

This is a new Beta development release, fixing recently discovered bugs.

Note

This Beta release, as any other pre-production release, should not be installed on *production* level systems or systems with critical data. It is good practice to back up your data before installing any new version of software. Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at http://bugs.mysql.com/ for more details about the individual bugs fixed in this version.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details, please see http://www.mysql.com/products/enterprise.

Functionality Added or Changed

- **MySQL Cluster**: The `NDB` storage engine now supports `CREATE TABLE` statements of arbitrary length. (Previously, `CREATE TABLE` statements for MySQL Cluster tables could contain a maximum of 4096 characters only.) (Bug #17813)
- **MySQL Cluster**: Added the `--nowait-nodes` startup option for `ndbd`, making it possible to skip specified nodes without waiting for them to start when starting the cluster. See `ndbd` — The MySQL Cluster Data Node Daemon.
- `SHOW PLUGIN` was renamed to `SHOW PLUGINS`. `SHOW PLUGIN` now is deprecated and generates a warning. (Bug #17112)
- `mysqld_safe` no longer checks for a `mysqld-max` binary. Instead, `mysqld_safe` nows checks only for the standard `mysqld` server unless another server binary is specified explicitly using `--mysqld` [242] or `--mysqld-version` [242]. If you previously relied on the implicit invocation of `mysqld-max`, you should use an appropriate option now. (Bug #17861)
- Large file support was re-enabled for the MySQL server binary for the AIX 5.2 platform. (Bug #13571)
- For partitioned tables, the output of `SHOW TABLE STATUS` now shows in the `Engine` column the name of the storage engine used by all partitions for the table; in the `Create_options` column, the output now shows `partitioned` for a partitioned table. This change also affects the values shown in the corresponding columns of the `INFORMATION_SCHEMA.TABLES` table. (Bug #17631)
- Binary MySQL distributions now include a `mysqld-max` server, in addition to the usual `mysqld` optimized server and the `mysqld-debug` debugging server.

Bugs Fixed

- **Security Fix**: Invalid arguments to `DATE_FORMAT()` [985] caused a server crash. Thanks to Jean-David Maillefer for discovering and reporting this problem to the Debian project and to Christian Hammers from the Debian Team for notifying us of it. (Bug #20729, CVE-2006-3469)

- **Partitioning**: **MySQL Cluster**: `BLOB` columns did not work correctly with user-partitioned `NDB` tables. (Bug #16796)
- **MySQL Cluster**: `TRUNCATE TABLE` did not reset the `AUTO_INCREMENT` counter for `MyISAM` tables when issued inside a stored procedure.

  Note

  This bug did not affect `InnoDB` tables.

  In addition, `TRUNCATE TABLE` does not reset the `AUTO_INCREMENT` counter for `NDB` tables regardless of when it is called.

  (Bug #14945)

  References: See also Bug #18864.
- **MySQL Cluster**: An uninitialized internal variable could lead to unexpected results. (Bug #18831)
- `EXTRACT(QUARTER FROM date)` [987] returned unexpected results. (Bug #18100)
- Partition pruning did not work properly for some kinds of partitioning and subpartitioning, with certain `WHERE` clauses. (Partitions and subpartitions that should have been marked as used were not so marked.) The error could manifest as incorrect content in `EXPLAIN PARTITIONS` output as well as missing rows in the results of affected queries. (Bug #18558)
- If `InnoDB` encountered a `HA_ERR_LOCK_TABLE_FULL` error and rolled back a transaction, the transaction was still written to the binary log. (Bug #18283)
- Queries using `WHERE ... IS NULL` returned incorrect results from partitioned tables. (Bug #18070)
- Delimited identifiers could not be used in defining partitions. (Bug #13433)
- A query against a partitioned table using `WHERE col IS NULL` could produce incorrect results given the following conditions:
  - The table had partitions and subpartitions
  - The partitioning function depended on a single column `col` of one of the MySQL integer types
  - The partitioning function was not monotonically increasing

  The same issue could cause the server to crash when run in debug mode. (Bug #18659)
- Partition pruning did not perform correctly with partitions on `NULL`, and could potentially crash the server. (Bug #18053)
- `COUNT(*)` [1045] on a `MyISAM` table could return different results for the base table and a view on the base table. (Bug #18237)
- For tables created in a MySQL 4.1 installation upgraded to MySQL 5.0 and up, multiple-table updates could update only the first matching row. (Bug #16281)
- Triggers created in one version of the server could not be dropped after upgrading to a newer version. (Bug #15921)
- `CAST(double AS SIGNED INT)` [1012] for large `double` values outside the signed integer range truncated the result to be within range, but the result sometimes had the wrong sign, and no warning was generated. (Bug #15098)
- `mysql_reconnect()` sent a `SET NAMES` statement to the server, even for pre-4.1 servers that do not understand the statement. (Bug #18830)

- For `mysql.server`, if the `basedir` option was specified after `datadir` in an option file, the setting for `datadir` was ignored and assumed to be located under `basedir`. (Bug #16240)
- Quoted values could not be used for partition option values. (Bug #13520)
- Complex queries with nested joins could cause a server crash. (Bug #18279)
- Building the server using `--with-example-storage-engine` failed to enable the `EXAMPLE` storage engine in the server. (Bug #18464)
- `MEDIUMINT` columns were not handled in the same way as other column types by partition pruning.

  Partition pruning would sometimes use inappropriate columns in performing queries.

  Both of these issues were rectified as part of the same bug fix. (Bug #18025)
- For full-text searches in boolean mode, and when a full-text parser plugin was used, a `MYSQL_FTPARSER_PARAM::ftparser_state` could have been corrupted by recursive calls to the plugin. (Bug #18836)
- `mysql_config` returned incorrect libraries on `x86_64` systems. (Bug #13158)
- The server was always built as though `--with-extra-charsets=complex` [135] had been specified. (Bug #12076)

Changes in MySQL 5.1.8 (Not released)

Note

This was an internal release only, and no binaries were published.

Functionality Added or Changed

- **Cluster Replication**: **Incompatible Change**: The `cluster_replication` database has been renamed to `cluster`. This will effect replication between MySQL Clusters where one cluster is running MySQL 5.1.8 or later, and the other is running MySQL 5.1.7 or earlier. See MySQL Cluster Replication, and especially MySQL Cluster Replication Schema and Tables.
- **Incompatible Change**: The semantics of `ALTER TABLE t ENGINE=X;` for partitioned tables is changed, and now means that the storage engine used for table `t` is changed to `X`.

  The previous statement formerly (prior to MySQL 5.1.8) meant that all partitioning was removed from the table. To remove the partitioning of a table, the syntax `ALTER TABLE t REMOVE PARTITIONING;` is introduced. The `REMOVE PARTITIONING` option can be used in combination with existing `ALTER TABLE` options such as those employed for adding or dropping columns or indexes. (Bug #17754)
- **Incompatible Change**: For purposes of determining placement, `RANGE` partitioning now treats `NULL` as less than any other value. (Formerly, `NULL` was treated as equal to zero.) See How MySQL Partitioning Handles `NULL`. (Bug #15447)
- **MySQL Cluster**: The `NDBCLUSTER` storage engine now supports `INSERT IGNORE` and `REPLACE` statements. Previously, these statements failed with an error. (Bug #17431)
- **MySQL Cluster**: The stability of `CREATE` and `DROP` operations on `NDB` tables containing `BLOB` columns has been improved. (Bug #17761)
- **Replication**: Triggers from older servers that included no `DEFINER` clause in the trigger definition now execute with the privileges of the invoker (which on the slave is the slave SQL thread). Previously, replication slaves could not replicate such triggers. (Bug #16266)
- **Replication**: A slave server may now switch the replication format automatically. This happens when the server is running in either `STATEMENT` or `MIXED` format and encounters a row in the binary

log that is written in `ROW` logging format. In that case, the slave switches to row-based replication temporarily for that event, and switches back to the previous format afterward.

- **Replication**: The `binlog_format` [1654] system variable now is dynamic and can be changed at runtime, as described in Replication Formats.
- **Replication**: The `binlog_format` [1654] system variable now can be set to a third format, `MIXED`, as described in Replication Formats.
- **Disk Data**: You can now have only one log file group at any one time. See `CREATE LOGFILE GROUP` Syntax. (Bug #16386)
- Temporary tables may no longer be partitioned. (Bug #17497)
- `MICROSECOND` intervals are no longer permitted for events. (Bug #16411)
- More specific error messages are now given when attempting to create an excessive number of partitions or subpartitions. (Previously, no distinction was made between an excessive number of partitions and an excessive number of subpartitions.) (Bug #17393)
- Added the `--events` [296] option to `mysqldump` to enable events to be included in the dump output. (Bug #16853)
- Events no longer support times past the end of the Unix epoch. (Formerly, such dates were interpreted as being at the beginning of the Unix epoch.) (Bug #16396)
- Builds for Windows, Linux, and Unix (except AIX) platforms now have SSL support enabled, in the server as well as in the client libraries. Because part of the SSL code is written in C++, this does introduce dependencies on the system's C++ runtime libraries in several cases, depending on compiler specifics. (Bug #18195)
- Added the `--sysdate-is-now` [446] option to `mysqld` to enable `SYSDATE()` [992] to be treated as an alias for `NOW()` [990]. See Date and Time Functions. (Bug #15101)
- `mysqldump` now surrounds the `DEFINER`, `SQL SECURITY DEFINER` and `WITH CHECK OPTION` clauses of a `CREATE VIEW` statement with "not in version" comments to prevent errors in earlier versions of MySQL. (Bug #14871)
- The `mysql_ping()` function will now retry if the `reconnect` flag is set and error `CR_SERVER_LOST` [3998] is encountered during the first attempt to ping the server. (Bug #14057)
- The following deprecated constructs now generate warnings, and they are removed as of MySQL 5.5. Where alternatives are shown, applications should be updated to use them. Existing applications that depend on the deprecated constructs should be converted to make use of the current equivalents as soon as possible. You should not employ them in new applications.
  - The `log_bin_trust_routine_creators` system variable (use `log_bin_trust_function_creators` [488]).
  - The `table_type` [531] system variable (use `storage_engine` [528]).
  - The `TYPE` table option to specify the storage engine for `CREATE TABLE` or `ALTER TABLE` (use `ENGINE`).
  - The `SHOW TABLE TYPES` SQL statement (use `SHOW ENGINES`).
  - The `SHOW INNODB STATUS` and `SHOW MUTEX STATUS` SQL statements (use `SHOW ENGINE INNODB STATUS` and `SHOW ENGINE INNODB MUTEX`).
  - The `SHOW PLUGIN` SQL statement (use `SHOW PLUGINS`).
  - The `LOAD TABLE ... FROM MASTER` and `LOAD DATA FROM MASTER` SQL statements (use `mysqldump` or `mysqlhotcopy` to dump tables and `mysql` to reload dump files).

- The `BACKUP TABLE` and `RESTORE TABLE` SQL statements (use `mysqldump` or `mysqlhotcopy` to dump tables and `mysql` to reload dump files).
- `TIMESTAMP(N)` data type: The ability to specify a display width of *`N`* (use without *`N`*).
- The `--master-xxx` server options to set replication parameters (use the `CHANGE MASTER TO` statement instead): `--master-host`, `--master-user`, `--master-password` , `--master-port`, `--master-connect-retry`, `--master-ssl`, `--master-ssl-ca`, `--master-ssl-capath`, `--master-ssl-cert`, `--master-ssl-cipher`, `--master-ssl-key`.

In addition, `SHOW BDB LOGS` and `SHOW LOGS` are removed as of MySQL 5.1.12.

Important

`TYPE` vs `ENGINE` . In order not to break legacy applications, support for `TYPE = engine_name` —deprecated since MySQL 4.0—has been restored, but now generates a warning.

Beginning with MySQL 5.5, `TYPE = engine_name` will no longer be available and will produce a syntax error.

You should not use `TYPE` in any new applications, and you should immediately begin conversion of existing applications to use the `ENGINE = engine_name` syntax instead.

(Bug #17501)

- For an event having no `STARTS` time specified when it was created, the `mysql.event` table's `start` column now displays the creation time rather than `NULL`.

  In addition, both the `SHOW EVENTS` statement's `Starts` column and the `STARTS` column of the `INFORMATION_SCHEMA.EVENTS` table are now empty rather than `NULL` when `STARTS` was not used in the `CREATE EVENT` statement. (Bug #16537)

- Description of the `EVENT` [626] privilege has been changed to `To create, alter, drop, and execute events`. (Bug #16412)

- Names of subpartitions must now be unique for an entire table, and not merely within the same partition. (Bug #15408)

- Event names are now case-insensitive. That is (for example), you cannot have events with the names `Myevent` and `MyEvent` belonging to the same database and definer. (Bug #16415)

- The XPath `last()` function is now implemented for use with `ExtractValue()` [1016]. (Bug #16318)

- The output of `SHOW CREATE EVENT` no longer qualifies the event name with the name of the schem to which the event belongs. (Bug #17714)

- Partition pruning was made more stable, particularly in cases involving queries using tests for `NULL` values in the `WHERE` clause against subpartitioned tables which were partitioned by `LIST( some_function(col1, ... ,colN) )`. (Bug #17891)

- The `mysqltest` utility now converts all `CR/LF` combinations to `LF` to enable test cases intended for Windows to work properly on UNIX-like systems. (Bug #13809)

- The `ExtractValue()` [1016] function with `contains()` now uses the SQL collation in making comparisons. Previously, comparisons were always binary (that is, case-sensitive). (Bug #16316)

- The output from `SHOW CREATE TABLE` is more consistent about using uppercase for keywords. Data types still are in lowercase. (Bug #10460)

- The syntax for `CREATE PROCEDURE` and `CREATE FUNCTION` statements now includes a `DEFINER` clause. The `DEFINER` value specifies the security context to be used when checking access privileges at routine invocation time if the routine has the `SQL SECURITY DEFINER` characteristic. See `CREATE PROCEDURE` and `CREATE FUNCTION` Syntax, for more information.

  When `mysqldump` is invoked with the `--routines` [300] option, it now dumps the `DEFINER` value for stored routines.

- The client API now attempts to reconnect using TCP/IP if the `reconnect` flag is set, as is the case with sockets. (Bug #2845)

Bugs Fixed

- **Partitioning**: **MySQL Cluster**: Trying to insert a value into a nonexistent `LIST` partition of an `NDB` table would cause the server to crash.

  Note

  Beginning with MySQL 5.1.12, user-defined partitioning types other than `KEY` or `LINEAR KEY` were disabled for `NDB` tables.

  (Bug #17763)

- **Partitioning**: **MySQL Cluster**: A repeated `SELECT` on a partitioned table that used the `NDB` storage engine could cause the server to crash. (Bug #17390)

- **MySQL Cluster**: **Replication**: `AUTO_INCREMENT` values were not propagated correctly in statement-based replication. (Bug #18208)

- **MySQL Cluster**: **Replication**: Memory was mistakenly freed for `NdbRecAttr` objects during addition of an index while replicating the cluster, which could cause `mysqld` to crash. (Bug #18106)

- **MySQL Cluster**: **Replication**: Row-based replication could fail with tables using `VARCHAR` columns for primary keys and having `BLOB` columns. (Bug #18067)

- **MySQL Cluster**: **Replication**: (Replication): The binary log on the secondary master was not being set up correctly following a table rename. (Bug #17838)

- **MySQL Cluster**: `UNDO_BUFFER_SIZE` was limited to 17 MB. (Bug #16657, Bug #17890)

- **MySQL Cluster**: Issuing a `DROP LOGFILE GROUP` statement would cause `ndbd` processes to crash if MySQL had been compiled with `gcc4`. (Bug #18295)

- **MySQL Cluster**: A timeout in the handling of an `ABORT` condition with more that 32 operations could yield a node failure. (Bug #18414)

- **MySQL Cluster**: Trying to perform a `DELETE` from an `NDB` table following a `LOCK TABLES` caused the `ndbd` processes to hang. (Bug #17812)

- **MySQL Cluster**: A `SELECT ... ORDER BY` query on an explicitly partitioned Cluster table with no explicit indexes would crash the server. (Bug #17899)

- **MySQL Cluster**: When replacing a failed master node, the replacement node could cause the cluster to crash from a buffer overflow if it had an excessively large amount of data to write to the cluster log. (Bug #18118)

- **MySQL Cluster**: Two `mysqld` processes starting at the same time could cause a race condition. (Bug #18472)

- **MySQL Cluster**: `DELETE` operations on `NDB` tables could cause memory leaks. (Bug #16874)

- **MySQL Cluster**: `ALTER TABLE` on a partitioned `NDB` table could cause the server to crash. (Bug #17499)

- **MySQL Cluster**: The cluster created a crashed replica of a table having an ordered index—or when logging was not enabled, of a table having a table or unique index—leading to a crash of the cluster following 8 successive restarts. (Bug #18298)
- **MySQL Cluster**: When multiple node restarts were attempted without permitting each restart to complete, the error message returned was `Array index out of bounds` rather than `Too many crashed replicas`. (Bug #18349)
- **MySQL Cluster**: A simultaneous `RENAME` of several tables was logged multiple times. (Bug #17827)
- **MySQL Cluster**: Trying to update very large partitioned tables using the `NDB` storage engine sometimes caused the server to crash. (Bug #17806, Bug #16385)
- **MySQL Cluster**: Inserting and deleting `BLOB` column values while a backup was in process could cause data nodes to shut down. (Bug #14028)
- **MySQL Cluster**: Some query cache statistics were not always correctly reported for Cluster tables. (Bug #16795)
- **MySQL Cluster**: Using `ALTER TABLE ... ADD PARTITION` on a table partitioned by `LIST` would cause the client to hang. (Bug #17701)
- **MySQL Cluster**: Node recovery of tables with `VARCHAR` columns using character sets was inconsistent, which could cause a number of issues, including the data nodes failing to restart and `ALTER TABLE` statements to hang. (Bug #18026)
- **MySQL Cluster**: With a single replica, transactions waiting in the log synchronization queue were not being restarted, causing them to be aborted. (Bug #17536)
- **MySQL Cluster**: In event of a node failure during a rollback, a “false” lock could be established on the backup for that node, which lock could not be removed without restarting the node. (Bug #18352)
- **MySQL Cluster**: Attempting to restart a node with dropped events still pending would fail. (Bug #18491)
- **MySQL Cluster**: A node restart immediately following a `CREATE TABLE` would fail.

  Important

  This fix supports 2-node Clusters only.

  (Bug #18385)
- **MySQL Cluster**: Insufficient `StringBuffer` memory when attempting to create a trigger caused the server to crash. (Bug #18101)
- **MySQL Cluster**: In some cases, a single `ndbd` node failed following a system restart. (Bug #17854)
- **MySQL Cluster**: Restarting nodes were permitted to start and join the cluster too early. (Bug #16772)
- **MySQL Cluster**: Two `mysqld` processes did not synchronize `DROP TABLE` binary log events correctly. (Bug #18395)
- **MySQL Cluster**: `CREATE UNIQUE INDEX` on a column containing nonunique data could cause one or more `ndbd` nodes to hang or crash. (Bug #18040)
- **MySQL Cluster**: Variable-length columns used as primary keys were not handled correctly. (Bug #18075)
- **MySQL Cluster**: `ALTER TABLE ... ADD INDEX` failed with `ERROR 756: Index on disk column is not supported` when run against a Disk Data table having a primary key. (Bug #17888)

- **Replication**: The `DEFINER` value for stored routines was not replicated. (Bug #15963)
- **Replication**: Use of `TRUNCATE TABLE` for a `TEMPORARY` table on a master server was propagated to slaves properly, but slaves did not decrement the `Slave_open_temp_tables` [568] counter properly. (Bug #17137)
- **Replication**: Replication of data stored in a partitioned table would cause slave servers to issue a assertion and terminate. (Bug #18436)
- **Replication**: Slave servers would retry the execution of an SQL statement an infinite number of times, ignoring the value `SLAVE_TRANSACTION_RETRIES` when using the NDB engine. (Bug #16228)
- **Disk Data**: It was not possible to create more than 9 tablespaces. (Bug #16913)
- **Disk Data**: `CREATE UNIQUE INDEX` failed with `Error 4243: Index not found`. (Bug #18039)
- Names of subpartitions were not displayed in the output of `SHOW CREATE TABLE`. (Bug #16370)
- A query with a `WHERE date_column > date_value` condition failed on a table partitioned by `RANGE`. (Bug #17894)
- Renaming and adding a new column to a partitioned table in the same `ALTER TABLE` statement caused the server to crash. (Bug #17772)
- Stored procedures that call UDFs and pass local string variables caused server crashes. (Bug #17261)
- Using `ALTER TABLE` to increase the length of a `BINARY(M)` column caused column values to be padded with spaces rather than `0x00` bytes. (Bug #16857)
- The `ExtractValue()` [1016] function would not accept expressions which matched element names containing an underscore character. (Bug #16320)
- `ALTER TABLE ... REBUILD PARTITION` with no partition name specified would crash the server. (Bug #17940)
- A failed `ALTER TABLE ... ADD PRIMARY KEY` on a partitioned table would result in bad table metadata and could possibly crash the server. (Bug #17097)
- Repeated invocations of a stored procedure containing a `CREATE EVENT` or `ALTER EVENT` statement would crash the server. (Bug #16408)
- The `mysql_close()` C API function leaked handles for shared-memory connections on Windows. (Bug #15846)
- `ALTER TABLE ... REORGANIZE PARTITION` failed with `Error on rename of filename ...` on Windows. (Bug #17720)
- A memory leak caused warnings on slaves for certain statements that executed without warning on the master. (Bug #16175)
- `INSERT` statements executed by scheduled events were not written to the general log. (Bug #16413)
- Checks for permissions on database operations could be performed in a case-insensitive manner (a user with permissions on database `MYDATABASE` could by accident get permissions on database `myDataBase`), if the privilege data were still cached from a previous check. (Bug #17279)
- The MySQL server could crash with out of memory errors when performing aggregate functions on a `DECIMAL` column. (Bug #17602)
- Creating a partition which depends on an expression containing a column using the UTF8 character set would cause the server to crash. (Bug #14367)

- Connecting to a server with a UCS2 default character set with a client using a non-UCS2 character set crashed the server. (Bug #18004)
- `CREATE TABLE ... PARTITION ... AS SELECT ...` would cause the server to crash. (Bug #15336)
- `NULL` values were written to the `mysql.slow_log` table incorrectly. (Bug #17600)
- Calling `CREATE TABLE` or `ALTER TABLE` twice on a partitioned table in a stored procedure or a prepared statement resulted in errors and sometimes server crashes. (Bug #17290)
- The `self()` XPath function was not handled correctly by `ExtractValue()` [1016]. (Bug #16315)
- A `SELECT ... ORDER BY ...` from a view defined using a function could crash the server. An example of such a view is `CREATE VIEW v1 AS SELECT SQRT(c1) FROM t1`. (Bug #18386)
- The `ExtractValue()` [1016] function did not return an error when passed an invalid XPath string. (Bug #18172)
- Improper checking of binary log statements could result in a server crash. (Bug #17457)
- In a highly concurrent environment, a server crash or deadlock could result from execution of a statement that used stored functions or activated triggers coincident with alteration of the tables used by these functions or triggers. (Bug #16593)
- Using triggers with partitioned `InnoDB` tables led to incorrect results. (Bug #17744)
- On Linux, creation of table partitions failed within a stored procedure. (Bug #14363)
- If the server was started with the `--skip-grant-tables` [443] option, it was impossible to create a trigger or a view without explicitly specifying a `DEFINER` clause. (Bug #16777)
- Stored routine names longer than 64 characters were silently truncated. Now the limit is properly enforced and an error occurs. (Bug #17015)
- `MyISAM`: Performing a bulk insert on a table referenced by a trigger would crash the table. (Bug #17764)
- Creating a table with the same name as the mapped name of another table caused a server crash. For example, if MySQL maps the table name `txu#P#p1` to `txu@0023P@0023p1` on disk, creating another table named `txu@0023P@0023p1` crashed the server. (Bug #17142)
- Using the `position()` function in the XPath argument to `ExtractValue()` [1016] crashed the server. (Bug #18171)
- A problem with `NULL`s and interval mapping sometimes caused incorrect results or crashes when trying to use less-than searches on partitioned tables. (Bug #17173)
- For `FEDERATED` tables, a `SELECT` statement with an `ORDER BY` clause did not return rows in the proper order. (Bug #17377)
- Using `ORDER BY intvar` within a stored procedure (where *`intvar`* is an integer variable or expression) would crash the server.

  Note

  The use of an integer *`i`* in an `ORDER BY i` clause for sorting the result by the *`i`* th column is deprecated (and nonstandard). It should *not* be used in new applications. See `SELECT` Syntax.

  (Bug #16474)
- Invoking more than once a prepared statement that creates a partitioned table would crash the server. (Bug #14350)

- No error was reported when subpartitions were defined for a nonsubpartitioned table. (Bug #15961)
- Updating a view that filters certain rows to set a filtered out row to be included in the table caused infinite loop. For example, if the view has a WHERE clause of `salary > 100` then issuing an UPDATE statement of `SET salary = 200 WHERE id = 10`, caused an infinite loop. (Bug #17726)
- The `RENAME TABLE` statement did not move triggers to the new table. (Bug #13525)
- Triggers created without `BEGIN` and `END` clauses resulted in “You have an error in your SQL syntax” errors when dumping and replaying a binary log. (Bug #16878)
- When attempting to insert a `0` into a `LIST`-partitioned table that had no value-list containing `0`, no error was reported. (Bug #15253)
- Naming a partition using the characters **Ç** or **ç** (“c-cedilla”; Unicode `00C7` or `00E7`) made unreadable the table containing the partition. (Bug #14527)
- `REPAIR TABLE`, `OPTIMIZE TABLE`, and `ALTER TABLE` operations on transactional tables (or on tables of any type on Windows) could corrupt triggers associated with those tables. (Bug #18153)
- Searches on indexed columns of partitioned tables failed to find all matching rows following updates of the indexed columns. (Bug #14526)
- Trying to add a partition to a table having subpartitions could crash the server. (Bug #17140)
- Attempting to add a new partition to a table partitioned by a unique key would cause an `Out of memory` error. (Bug #17169)
- `ALTER TABLE ... ADD COLUMN ... AFTER ...` failed when used on partitioned tables. (Bug #16806)
- Cursors in stored routines could cause a server crash. (Bug #16887)
- Using `ALTER TABLE ... REBUILD PARTITION` without specifying the name of the partition caused the server to crash, rather than reporting a syntax error. (Bug #17947)
- Clients compiled from source with the `--without-readline` did not save command history from session to session. (Bug #16557)
- Repeated invocations of a stored procedure containing a `SHOW CREATE EVENT` statement would result in the error `Packets out of order`. (Bug #17403)
- A security enhancement in Visual Studio 8 could cause a MySQL debug server compiled with it to hang when running `SELECT` queries against partitioned tables. (Bug #17722)
- Slow queries executed by scheduled events were not being written to the slow query log. (Bug #16426)
- The `ExtractValue()` [1016] function permitted the use of the `!` character in identifiers by ignoring the illegal character. This is now correctly reported as a syntax error. (Bug #16313)
- `SELECT ... WHERE column LIKE 'A%'`, when *`column`* had a key and used the `latin2_czech_cs` collation, caused the wrong number of rows to be returned. (Bug #17374)
- Stored routines that contained only a single statement were not written properly to the dumpfile when using `mysqldump`. (Bug #14857)
- Execution of a stored function or trigger which inserted data into a table while running concurrent selects on the same table could result in storing incorrect data in the query cache. (Bug #14767)
- `ALTER TABLE ... COALESCE PARTITION` failed with an `Out of Memory` error. (Bug #16810)
- `SELECT COUNT(*)` for a `MyISAM` table could return different results depending on whether an index was used. (Bug #14980)

- Setting up subpartitions on at least one but not all the partitions of a partitioned table caused the server to crash. (Bug #15407)
- The length of a `VARCHAR()` column that used the `utf8` character set would increase each time the table was re-created in a stored procedure or prepared statement, eventually causing the `CREATE TABLE` statement to fail. (Bug #13134)
- Attempting to use a conflicting `VALUES` clause in `ALTER TABLE ... ADD PARTITION` caused the server to crash. An example of such a conflicting clause would be that uses `VALUES LESS THAN (constant)` (which indicates a range) with a table that is partitioned by `LIST`. (Bug #17127)
- A `SELECT` using a function against a nested view would crash the server. (Bug #15683)
- `mysql_fix_privilege_tables` did not create the `mysql.plugin` table. (Bug #17568)
- The server would execute stored routines that had a nonexistent definer. (Bug #13198)
- Character set conversion of string constants for `UNION` of constant and table column was not done when it was safe to do so. (Bug #15949)
- The server would crash when `SHOW STATUS` was called on a server linked with `yaSSL`. (Bug #18310)
- During conversion from one character set to `ucs2`, multi-byte characters with no `ucs2` equivalent were converted to multiple characters, rather than to `0x003F QUESTION MARK`. (Bug #15375)
- The `EXAMPLE` storage engine did not work on Windows. (Bug #17721)
- Issuing `GRANT EXECUTE` on a procedure would display any warnings related to the creation of the procedure. (Bug #7787)
- Setting the `myisam_repair_threads` [502] system variable to a value larger than 1 could cause corruption of large `MyISAM` tables. (Bug #11527)
- Loading of UDFs in a statically linked MySQL caused a server crash. UDF loading is now blocked if the MySQL server is statically linked. (Bug #11835)

Changes in MySQL 5.1.7 (2006-02-27)

Functionality Added or Changed

- **Incompatible Change**: The `mysql_stmt_attr_get()` C API function now returns a boolean rather than an unsigned int for `STMT_ATTR_UPDATE_MAX_LENGTH`. (Bug #16144)
- **Incompatible Change**: Due to a change in the naming scheme for partitioning and subpartitioning files, it is not possible for the server to read partitioned tables created in previous MySQL versions. Attempting to read pre-5.1.6 partitioned tables with a MySQL 5.1.7 or later server now generates a suitable warning message.

  Two possible workarounds are:

  - 1. Create a nonpartitioned table with the same table schema using a standard `CREATE TABLE` statement (that is, with no partitioning clauses)

    2. Issue a `SELECT INTO` to copy the data into the nonpartitioned table before the upgrade

    Following the upgrade, you can partition the new table using `ALTER TABLE ... PARTITION BY ...`.
  - Alternatively, you can dump the table using `mysqldump` prior to upgrading and reload it afterward with `LOAD DATA`.

  In either case, you should drop the pre-5.1.6 partitioned tables before upgrading to 5.1.6 or later.

Important

If any partitioned tables that were created prior to MySQL 5.1.6 are present following an upgrade to MySQL 5.1.6 or later, it is also not possible to read from the `INFORMATION_SCHEMA.PARTITIONS` table, nor will you be able to drop those tables or the database or databases in which they are located. In this event, you must:

1. Shut down `mysqld`
2. Manually delete the table, partition, and (if any) subpartition files
3. Restart the MySQL Server

(Bug #13437, Bug #16695)

- **Incompatible Change**: `TYPE = engine_name` is no longer accepted as a synonym for the `ENGINE = engine_name` table option. (`TYPE` has been deprecated since MySQL 4.0.)
- **MySQL Cluster**: Attempting to `SELECT ... FROM INFORMATION_SCHEMA.FILES` now raises a warning in the event that the cluster has crashed. (Bug #17087)
- **Replication**: In row-based replication, when executing a Rows_log_event, the associated table was locked, the rows applied and the lock released. This did not work since there are storage engines that count locks and perform an autocommit when the number of locks reach zero. Now we ensure that all table maps come before all `ROWS` events in a statement.
- **Disk Data**: Status messages have been added to `ndb_restore` to enable users to know that data files for Disk Data are being created. (Bug #16873)
- **Cluster Replication**: It is now possible to replicate `NDB` tables having no explicit primary key. See MySQL Cluster Replication.
- Creator privileges are now checked for all events before execution. (Bug #17289)
- Added the `--wait-timeout` option to `mysqlmanager` to enable configuration of the timeout for dropping an inactive connection, and increased the default timeout from 30 seconds to 28,800 seconds (8 hours). (Bug #15980, Bug #12674)
- All subpartitions within a given partitioned table are now guaranteed to have unique names. (Bug #15408)
- New `charset` command added to `mysql` command-line client. By typing `charset name` or `\C name` (such as `\C UTF8`), the client character set can be changed without reconnecting. (Bug #16217)
- `CREATE EVENT`, `DROP EVENT`, and `ALTER EVENT` statements are not permitted in triggers. (Bug #16410)
- The SQL mode in effect at the time an event is created or altered is recorded and used during event execution. (Bug #16407)
- Added the `IN NATURAL LANGUAGE MODE` and `IN NATURAL LANGUAGE MODE WITH QUERY EXPANSION` modifiers for full-text searches. See Full-Text Search Functions.
- Removed the `have_isam` [480] and `have_raid` [480] system variables.
- Several changes were made to make upgrades easier:
  - Added the `mysql_upgrade` program that checks all tables for incompatibilities with the current version of MySQL Server and repairs them if necessary. This program should be run for each

MySQL upgrade (rather than `mysql_fix_privilege_tables`). See `mysql_upgrade` — Check and Upgrade MySQL Tables.

- Added the `FOR UPGRADE` option for the `CHECK TABLE` statement. This option checks whether tables are incompatible with the current version of MySQL Server.
- Added the `--check-upgrade` [286] to `mysqlcheck` that invokes `CHECK TABLE` with the `FOR UPGRADE` option. Added the `--fix-db-names` [287] and `--fix-table-names` [287] options to `mysqlcheck`.

- Added the `PROCESSLIST` table to `INFORMATION_SCHEMA`.
- Added the `RENAME DATABASE` statement.
- `mysqlimport` now has a `--use-threads=N` [309] option for loading data files in parallel using *`N`* threads.

Bugs Fixed

- **MySQL Cluster**: In some cases, `LOAD DATA INFILE` did not load all data into `NDB` tables. (Bug #17081)
- **MySQL Cluster**: `CREATE TEMPORARY TABLE` of a Cluster table would fail with an `Unsupported` error or crash the server. (Bug #17210, Bug #16552)
- **MySQL Cluster**: `CREATE TABLE new_tbl LIKE old_tbl;` failed when *`old_tbl`* used the `NDB` storage engine. (Bug #17005)
- **MySQL Cluster**: `UNIQUE` keys in Cluster tables were limited to 225 bytes in length. (Bug #15918)
- **MySQL Cluster**: A `DELETE` with a join in the `WHERE` clause failed to retrieve any records if both tables in the join did not have a primary key. (Bug #17249)
- **MySQL Cluster**: Following multiple forced shutdowns and restarts of data nodes, `DROP DATABASE` could fail. (Bug #17325)
- **MySQL Cluster**: `REPLACE` failed when attempting to update a primary key value in a Cluster table. (Bug #14007)
- **MySQL Cluster**: The `REDO` log would become corrupted (and thus unreadable) in some circumstances, due to a failure in the query handler. (Bug #17295)
- **MySQL Cluster**: Creating `NDB` tables containing `BLOB` columns but no primary key caused unpredictable behavior. (Bug #17559)
- **MySQL Cluster**: No error message was generated for setting `NoOfFragmentLogFiles` [1826] too low. (Bug #13966)
- **MySQL Cluster**: Cluster log file paths were truncated to 128 characters. They may now be as long as `MAX_PATH` (the maximum path length permitted by the operating system). (Bug #17411)
- **MySQL Cluster**: Table definitions were not shared between multiple SQL nodes in a cluster without binary logging being enabled. (Bug #17414)
- **MySQL Cluster**: No error message was generated for setting `MaxNoOfAttributes` [1828] too low. (Bug #13965)
- **MySQL Cluster**: An unhandled resources issue could cause node failure with a `DELETE FROM TABLE` affecting thousands of rows. (Bug #16492)
- **MySQL Cluster**: `ndbd` restarts could sometimes fail due to incorrect memory access. (Bug #17417)
- **MySQL Cluster**: An `UPDATE` with an inner join failed to match any records if both tables in the join did not have a primary key. (Bug #17257)

- **MySQL Cluster**: When attempting to import data into an `NDB` table using `LOAD DATA INFILE`, the server would hang in the event of a duplicate key error. (Bug #17154)
- **MySQL Cluster**: Sharing of table names containing special characters between multiple SQL nodes was not handled correctly when binary logging was enabled (a timeout error resulted). (Bug #17415)
- **MySQL Cluster**: The storage engine did not permit views to be updated. (Bug #17206)
- **MySQL Cluster**: Inserting the output of `REPEAT('some_string', some_int)` [955] into a `BLOB` column resulted in the error `Invalid blob attributes or invalid blob parts table`. (Bug #17505)
- **MySQL Cluster**: `SHOW CREATE TABLE` would fail when run against a table created in a different session. (Bug #17340)
- **MySQL Cluster**: Performing large numbers of data manipulation statements on cluster tables using Disk Data could lead to a server crash.
- **Cluster Replication**: **Replication**: Row-based replication of a cluster failed to take `--binlog-ignore-db` [1651] settings into account. (Bug #17188)
- **Replication**: Previously, a stored function invocation was written to the binary log as `DO func_name()` if the invocation changes data and occurs within a nonlogged statement, or if the function invokes a stored procedure that produces an error. These invocations now are logged as `SELECT func_name()` instead for better control over error code checking (slave servers could stop due to detecting a different error than occurred on the master). (Bug #14769)
- **Replication**: An `ALTER DATABASE` statement on a replication master crashed the slaves. (Bug #17521)
- **Replication**: `BIT` fields were not properly handled when using row-based replication. (Bug #13418)
- **Replication**: For a transaction that used `MyISAM` and `InnoDB` tables, interruption of the transaction due to a dropped connection on a master server caused slaves to lose synchrony. (Bug #16559)
- **Disk Data**: In some cases, a cluster using Disk Data tables could not be restarted following a normal shutdown. (Bug #16872)
- **Cluster Replication**: Row-based replication was not set up correctly if a backup was already in progress. For example, connecting a `mysqld` instance to a cluster which was being backed up would result in the message `NDB: skipping setup table tbl_name` being written to the error log. (Bug #17459)
- **Cluster Replication**: Cluster tables not having an explicit primary key could not be replicated. (Bug #14541)
- Using an XPath expression containing `=` with `ExtractValue()` [1016] caused the server to crash. (Bug #16242)
- Statements that contained Unicode characters were not logged to the log tables correctly. (Bug #16905)
- When used with the `ExtractValue()` [1016] function, an XPath expression having no leading "`/`" character would crash the server. (Bug #16234)
- Using `GROUP BY` on column used in `WHERE` clause could cause empty set to be returned. (Bug #16203)
- Querying the `INFORMATION_SCHEMA.PARTITIONS` table on a nonmax server caused a server crash. This also happened following the creation of a table with a very large number (hundreds) of partitions. (Bug #16591, Bug #17141)
- Creating an event and using a whitespace character other than space following the `DO` keyword caused a server crash. (Bug #17453)

- `SHOW CREATE EVENT` displayed no output. (Bug #16423)
- `myisam_ftdump` did not work for `FULLTEXT` indexes associated with a parser plugin. (Bug #17116)
- `SET sql_mode = N`, where `N` > 31, did not work properly. (Bug #13897)
- Race conditions between event creation, dropping, and execution could result in a server crash or hang. (Bug #17373)
- MySQL server dropped client connection for certain `SELECT` statements against views defined that used `MERGE` algorithm. (Bug #16260)
- A `SELECT` from the last partition of a subpartitioned table having a `UNIQUE KEY` could crash the MySQL Server. (Bug #16907)
- A statement containing `GROUP BY` and `HAVING` clauses could return incorrect results when the `HAVING` clause contained logic that returned `FALSE` for every row. (Bug #14927)
- Using `REPLACE INTO` on a partitioned table having a primary key would crash the server in the event of a duplicate key error. (Bug #16782)
- Killing a long-running query containing a subquery could cause a server crash. (Bug #14851)
- Data truncations on non-`UNIQUE` indexes could crash `InnoDB` when using multi-byte character sets. (Bug #17530)
- `CAST(... AS TIME)` [1012] operations returned different results when using versus not using prepared-statement protocol. (Bug #15805)
- Partitioning with certain `SUBPARTITION BY HASH` clauses caused an error when querying for a partitioned column using an `IS NULL` [940] comparison. (Bug #17430, Bug #17432)
- Column counts were encoded incorrectly in the binary log for row-based logging format. (Bug #17678)
- The `mysql_fix_privilege_tables.sql` script did not properly initialize the `Event_priv` column to `'Y'` for those accounts that should have the `EVENT` [626] privilege. (Bug #16400)
- The `SELECT` [627] privilege was required for triggers that performed no selects. (Bug #15196)
- If the query optimizer transformed a `GROUP BY` clause in a subquery, it did not also transform the `HAVING` clause if there was one, producing incorrect results. (Bug #16603)
- `DROP DATABASE` did not drop events for the database. (Bug #16406)
- A `RETURN` statement within a trigger caused a server crash. `RETURN` is no longer permitted within triggers. To exit immediately, use `LEAVE`. (Bug #16829)
- `SELECT` with `GROUP BY` on a view could cause a server crash. (Bug #16382)
- Execution times for scheduled events were not calculated correctly: the last execution time was used as a base rather than the actual start time. (Bug #17494)
- Attempting to add a new partition to a table partitioned by a unique key would cause an `Out of memory` error. (Bug #17169)
- The `UPDATE` [628] privilege was required for triggers that performed no updates. (Bug #15166)
- Trying to create a partitioned table with more than 32 attributes failed. (Bug #17179)
- A `SELECT` on a subpartitioned table having a multiple-column `PRIMARY` or `UNIQUE KEY`, and whose partitioning function used only the first column of the key, could cause `mysqld` to crash. (Bug #16901)

- `SUBSTRING_INDEX()` [958] could yield inconsistent results when applied with the same arguments to consecutive rows in a query. (Bug #14676)
- `SHOW CREATE TABLE` produced extraneous spaces following the keywords `PRIMARY KEY`. (Bug #13883)
- `DROP TABLE` would sometimes fail on a table having subpartitions that used the default storage engine. (Bug #16775)
- On Windows platforms, some attempts to create partitioned tables from the command line would cause the `mysql` client to hang. (Bug #17082)
- `InnoDB` could display an incorrect error message for a cascading update. (Bug #9680)
- `SET TRANSACTION ISOLATION LEVEL` acted like `SET SESSION TRANSACTION ISOLATION LEVEL`. That is, it set the isolation level for longer than the next transaction. (Bug #7955)
- `CHECKSUM TABLE` returned different values for `MyISAM` tables depending on whether the `QUICK` or `EXTENDED` option was used. (Bug #8841)
- Repeated invocation of `my_init()` and `my_end()` caused corruption of character set data and connection failure. (Bug #6536)

Changes in MySQL 5.1.6 (2006-02-01)

Functionality Added or Changed

- **Incompatible Change**: Words with apostrophes are now matched in a FULLTEXT search against nonapostrophe words (for example, a search for `Jerry` will match against the term `Jerry's`). Users upgrading to this version must issue `REPAIR TABLE ... QUICK` statements for tables containing `FULLTEXT` indexes. (Bug #14194)
- **Incompatible Change**: This release introduces the `TRIGGER` [628] privilege. Previously, the `SUPER` [628] privilege was needed to create or drop triggers. Now those operations require the `TRIGGER` [628] privilege. This is a security improvement because you no longer need to grant users the `SUPER` [628] privilege to enable them to create triggers. However, the requirement that the account named in a trigger's `DEFINER` clause must have the `SUPER` [628] privilege has changed to a requirement for the `TRIGGER` [628] privilege. After upgrading, be sure to update your grant tables by running `mysql_upgrade`. This will assign the `TRIGGER` [628] privilege to all accounts that had the `SUPER` [628] privilege. (After updating, you might also consider whether any of those accounts no longer need the `SUPER` [628] privilege.) If you fail to update the grant tables, triggers may fail when activated. (Bug #9412)
- **Incompatible Change**: Before MySQL 5.1.6, the server writes general query log and slow query log entries to log files. As of MySQL 5.1.6, the server's logging capabilities for these logs are more flexible. Log entries can be written to log files (as before) or to the `general_log` [477] and `slow_log` tables in the `mysql` database. If logging is enabled, either or both destinations can be selected. The `--log-output` [431] option controls the destination or destinations of log output. See Selecting General Query and Slow Query Log Output Destinations.

  If logging is enabled, the default destination now is to log to tables, which differs from earlier versions. If you had the server configured for logging to log files formerly, use `--log-output=FILE` to preserve this behavior after an upgrade to MySQL 5.1.6 or higher.
- **Important Change**: **MySQL Cluster**: **Replication**: Replication between MySQL Clusters is now supported. It is now also possible to replicate between a MySQL Cluster and a noncluster database. See MySQL Cluster Replication, for more information.
- **MySQL Cluster**: The `NDB` storage engine now supports the `CREATE INDEX` and `DROP INDEX` statements.
- **MySQL Cluster**: Added the `ndb_extra_logging` [1924] system variable.

- **Packaging**: MySQL 5.1.6 introduces some changes to distribution packaging:
  - Distributions include both a `mysqld` optimized server and `mysqld-debug` debugging server. There is no separate debug distribution.
  - There is no longer a `mysqld-max` server. (Note: This changed in MySQL 5.1.9: The `mysqld-max` server also is included in binary distributions.)
  - Server binaries no longer are stripped, except for RPM distributions.
  - Binary distributions for Unix and Unix-like systems no longer include `safe_mysqld` as a link to `mysqld_safe`. `safe_mysqld` has been deprecated since MySQL 4.0 and now is removed.
- `ANALYZE TABLE` is now supported for partitioned tables. (Bug #13441)
- Partition support is not an “engine”, but it was included in the output of `SHOW ENGINES`. Now it is not. The `have_partition_engine` variable was renamed to `have_partitioning` [480]. (Bug #14355, Bug #16718)
- The `mysqldump` utility now supports an option for dumping tablespaces. Use `-Y` or `--all-tablespaces` [294] to enable this functionality. (Bug #16753)
- Added the `EVENTS` table to `INFORMATION_SCHEMA`.
- Added the `PARTITIONS` table to `INFORMATION_SCHEMA`.
- Server plugins can register their own status variables to be displayed by the `SHOW STATUS` statement.
- The `ARCHIVE` storage engine now supports the `AUTO_INCREMENT` column attribute and the `AUTO_INCREMENT` table option. The `ARCHIVE` Storage Engine.
- Server binaries no longer are stripped, except for RPM distributions.
- Distributions include both a `mysqld` optimized server and `mysqld-debug` debugging server. There is no separate debug distribution.
- MySQL 5.1.6 introduces the *Event Scheduler* which enables statements to be scheduled for execution at predetermined times. Events can be transient (one-time-only) or recurrent at regular intervals, and may execute queries and statements permitted in stored routines, including compound statements.

  Events can be altered after creation, and dropped when no longer needed.

  Information about scheduled events can be obtained using the statements `SHOW EVENTS` and `SHOW CREATE EVENT`, or by querying the `INFORMATION_SCHEMA.EVENTS` table. All of these are available beginning in MySQL 5.1.6.

  Users must have the `EVENT` [626] privilege (also added in 5.1.6) to create events.

  For more information, see Using the Event Scheduler.
- Added the `event_scheduler` [474] system variable.
- Special characters in database and table identifiers now are encoded when creating the corresponding directory names and file names. This relaxes the restrictions on the characters that can appear in identifiers. See Mapping of Identifiers to File Names.
- Binary distributions for Unix and Unix-like systems no longer include `safe_mysqld` as a link to `mysqld_safe`. `safe_mysqld` has been deprecated since MySQL 4.0 and now is removed.
- Added the `FILES` table to `INFORMATION_SCHEMA`.

- There is no longer a `mysqld-max` server. (Note: This changed in MySQL 5.1.9: The `mysqld-max` server also is included in binary distributions.)
- Queries against partitioned tables can now take advantage of partition pruning. In some cases, this can result in query execution that is an order of magnitude faster than the same query against a nonpartitioned version of the same table.
- Added the `--use-threads` [320] option for `mysqlslap`.

Bugs Fixed

- **MySQL Cluster**: `CREATE TABLESPACE` statements were incorrectly parsed on 64-bit platforms. (`INITIAL SIZE` *`size`* worked, but `INITIAL SIZE =` *`size`* failed.) (Bug #13556)
- **MySQL Cluster**: A `BIT` column whose offset and length totaled 32 caused the cluster to crash. (Bug #16125)
- **MySQL Cluster**: Using `mysqldump` to obtain a dump of a partitioned table employing the `NDB` storage engine produced a nonfunctional table creation statement. (Bug #13155)
- **MySQL Cluster**: `NDB` returned an incorrect `Can't find file error` for OS error 24; this has been changed to `Too many open files`. (Bug #15020)
- **MySQL Cluster**: `NDB` leaked disk space when performing repeated `INSERT` or `DELETE` statements. (Bug #16771)
- **MySQL Cluster**: Trying to import too many dumped tables requiring resources beyond those allocated in the cluster configuration file caused the server to crash instead of reporting an insufficient resources error. (Bug #16455)
- **MySQL Cluster**: `ndb_delete_all` ran out of memory when processing tables containing `BLOB` columns. (Bug #16693)
- **MySQL Cluster**: The `ndb_autodiscover` test failed sporadically due to a node not being permitted to connect to the cluster. (Bug #15619)
- **Disk Data**: `DROP LOGFILE GROUP` corrupted the cluster file system and caused `ndbd` to fail when running more than one node on the same system. (Bug #16193)
- **Disk Data**: `NDB` returned the wrong error when the tablespace on disk was full. (Bug #16738)
- **Disk Data**: Tablespaces created using parameters with relatively low values (10 MB or less) produced filesizes much smaller than expected. (Bug #16742)
- **Disk Data**: The error message generated by a failed `ADD UNDOFILE` did not provide any reasons for the failure. (Bug #16267)
- **Cluster API**: Upon the completion of a scan where a key request remained outstanding on the primary replica and a starting node died, the scan did not terminate. This caused incomplete error handling for the failed node. (Bug #15908)
- Creating a partitioned table using a storage engine other than the session default storage engine caused the server to crash. (Bug #15966)
- The `mysql_real_connect()` C API function incorrectly reset the `MYSQL_OPT_RECONNECT` option to its default value. (Bug #15719)
- Multi-byte path names for `LOAD DATA` and `SELECT ... INTO OUTFILE` caused errors. Added the `character_set_filesystem` [465] system variable, which controls the interpretation of string literals that refer to file names. (Bug #12448)
- `ALTER TABLE ... ADD PARTITIONS` on a table with one partition crashed the server. (Bug #15820)

- Using `RANGE` partitioning with a `CASE` [946] expression as the partitioning function would cause records to be placed in the wrong partition. (Bug #15393)
- Using `ENGINE=...` within a `PARTITION` clause could cause the server to crash. (Bug #13438)
- Certain subqueries where the inner query was the result of a aggregate function would return different results with MySQL 5.1 than with MySQL 4.1.

  Subselects could also return wrong results when the query cache and grouping were involved. (Bug #15347)
- The server would permit foreign keys to be declared in the definition of a partitioned table despite the fact that partitioned tables do not support foreign keys (see Restrictions and Limitations on Partitioning). (Bug #13446)
- `ALTER TABLE ... DROP PARTITION` would truncate all `DATE` column values in the table's remaining partitions to `NULL`. (Bug #13644)
- In some cases the query optimizer did not properly perform multiple joins where inner joins followed left joins, resulting in corrupted result sets. (Bug #15633)
- `CREATE TABLE ... LIKE` did not work if the table whose schema was to be copied was a partitioned table. (Bug #13435)
- An indexing error sometimes caused values to be assigned to the wrong `RANGE` partition. (Bug #16684)
- The error message for specifying values for which no partition exists returned wrong values on certain platforms. (Bug #15910)
- When the full-text search parser plugin returned more words than half of the length (in bytes) of the query string, the server would crash. (Bug #16722)
- An `ALTER TABLE ... PARTITION BY ...` statement did not have any effect. (Bug #15523)
- Trying to add more than one partition in a single `ALTER TABLE ... ADD PARTITION` statement caused the server to crash. (Bug #16534)
- Using an identifier rather than a literal integer value in the `LESS THAN` clause of a range-partitioned table could cause the server to crash and corruption of tables. (Bug #13439)
- Improper memory handling for stored routine variables could cause memory overruns and binary log corruption. (Bug #15588)
- An `INSERT` statement in a stored procedure corrupted the binary log. (Bug #16621)
- Certain permission management statements could create a `NULL` host name for a user, resulting in a server crash. (Bug #15598)
- `STR_TO_DATE(1,NULL)` [991] caused a server crash. (Bug #15828, CVE-2006-3081)
- Inserting a negative value into an integer column used as the partitioning key for a table partitioned by `HASH` could cause the server to crash. (Bug #15968)
- Attempting to insert data into a partitioned table that used the `BLACKHOLE` storage engine caused `mysqld` to crash. (Bug #14524)
- The absence of a table in the left part of a left or right join was not checked prior to name resolution, which resulted in a server crash. (Bug #15538)
- With a table partitioned by `LIST`, inserting a value which was smaller than any value shown in the partitioning value-lists could cause the server to crash. (Bug #14365)
- The `DATA DIRECTORY` and `INDEX DIRECTORY` clauses of a `CREATE TABLE` statement involving partitions did not work. (Bug #14354)

- `ALTER TABLE ... ADD PARTITION` could crash the server or cause an `Out of memory` error in some circumstances. (Bug #13447)
- Parallel builds occasionally failed on Solaris. (Bug #16282)
- `SHOW CREATE TABLE` did not display the `PARTITIONS` clause for tables partitioned by `HASH` or `KEY`. (Bug #14327)
- A `FULLTEXT` query in a prepared statement could result in unexpected behavior. (Bug #14496)
- Specifying a value for `--tmpdir` without a trailing slash had unpredictable results. (Bug #15904)
- Issuing a `TRUNCATE TABLE` statement twice in succession on the same partitioned table would cause the server to crash. (Bug #13442)
- A `SELECT` from a key-partitioned table with a multi-column key could cause the server to crash. (Bug #13445)
- Using a `REPLACE` statement on a partitioned table caused the server to crash. (Bug #13440)
- Using the `TRUNCATE()` [978] function with a negative number for the second argument on a `BIGINT` column returned incorrect results. (Bug #8461)
- Temporary table aliasing did not work inside stored functions. (Bug #12198)
- Certain Japanese table names were not properly saved during a `CREATE TABLE` statement. (Bug #3906)

Changes in MySQL 5.1.5 (2006-01-10)

Functionality Added or Changed

- **Replication**: Added the `binlog_format` [1654] system variable that controls whether to use row-based or statement-based binary logging. Added the `--binlog-format` [419] and `--binlog-row-event-max-size` [1647] server options for binary logging control. See Replication Formats.
- Added the `--port-open-timeout` [440] option to `mysqld` to control how many seconds the server should wait for the TCP/IP port to become free if it cannot be opened. (Bug #15591)
- Added the XML functions `ExtractValue()` [1016] and `UpdateXML()` [1018]. `ExtractValue()` [1016] returns the content of a fragment of XML matching a given XPath expression. `UpdateXML()` [1018] replaces the element selected from a fragment of XML by an XPath expression supplied by the user with a second XML fragment (also user-supplied), and returns the modified XML. See XML Functions.
- Added the `INFORMATION_SCHEMA ENGINES` table.
- Plugins now can have status variables that are displayed in the output from `SHOW STATUS`. See Writing Plugins.
- Two new Hungarian collations are included: `utf8_hungarian_ci` and `ucs2_hungarian_ci`. These support the correct sort order for Hungarian vowels. However, they do not support the correct order for sorting Hungarian consonant contractions; we expect to fix this issue in a future release.
- Added the `INFORMATION_SCHEMA PLUGINS` table and the `SHOW PLUGIN` statement.
- Added the `--base64-output` [349] option to `mysqlbinlog` to print all binary log entries using base64 encoding. This is for debugging only. Logs produced using this option should not be applied on production systems.
- If `innodb_locks_unsafe_for_binlog` [1372] is enabled or if the transaction isolation mode is `READ COMMITTED` [1224], `InnoDB` can use “semi-consistent” reads. This affects treatment by `UPDATE` statements for rows that are already locked by another transaction. If a row is locked, `InnoDB` returns the latest committed version to MySQL so that MySQL can determine whether the

row matches the `WHERE` condition of the `UPDATE`. If the row matches (must be updated), MySQL reads the row again and this time `InnoDB` either locks it or waits for a lock on it.

References: See also Bug #3300.

- Added the `--create-schema`, `--lock-directory`, `--number-of-queries`, `--only-print`, `--preserve-schema`, and `--slave` options for `mysqlslap`.
- A new statement, `BINLOG`, is generated by `mysqlbinlog` to represent row-based events in binary log files. The statement argument, a base 64-encoded string, is decoded by the server to determine the data change indicated by the corresponding event.

Bugs Fixed

- `InnoDB`: Comparison of indexed `VARCHAR CHARACTER SET ucs2 COLLATE ucs2_bin` columns using `LIKE` could fail. (Bug #14583)
- Creating a trigger caused a server crash if the table or trigger database was not known because no default database had been selected. (Bug #14863)
- Attempting to insert into a table partitioned by `LIST` a value less than any specified in one of the table's partition definitions resulted in a server crash. In such cases, `mysqld` now returns `ERROR 1500 (HY000): Table has no partition for value` *`v`* , where *`v`* is the out-of-range value. (Bug #15819)
- The `--plugin_dir` [510] option was not working. Specifying the parser name for full-text also did not work correctly. (Bug #16068)
- The output of `mysqldump --triggers` did not contain the `DEFINER` clause in dumped trigger definitions. (Bug #15110)
- A `COMMIT` statement followed by a `ALTER TABLE` statement on a BDB table caused server crash. (Bug #14212)
- The output of `SHOW TRIGGERS` contained extraneous whitespace. (Bug #15103)
- Issuing a `DROP USER` statement could cause some users to encounter a *`hostname`* `is not permitted to connect to this MySQL server` error. (Bug #15775)
- `INSERT DELAYED` caused `mysqld` to crash. (Bug #16095)
- An `INSERT ... SELECT` statement between tables in a `MERGE` set can return errors when statement involves insert into child table from merge table or vice-versa. (Bug #5390)
- `InnoDB`: A semi-consistent read for an `UPDATE` statement with no index column in the `WHERE` condition locked all the rows in the table. (Bug #3300)

Changes in MySQL 5.1.4 (2005-12-21)

Functionality Added or Changed

- Added the `--server-id` [1617] option to `mysqlbinlog` to enable only those events created by the server having the given server ID to be extracted. (Bug #15485)
- It is now possible to build the server such that `MyISAM` tables can support up to 128 keys rather than the standard 64. This can be done by configuring the build using the option `--with-max-indexes=`*`N`* , where *`N`*≤128 is the maximum number of indexes to permit per table. (Bug #10932)
- Added the `cp1250_polish_ci` collation for the `cp1250` character set.
- The bundled `BDB` library was upgraded to version 4.4.16.
- Added the `mysqlslap` program, which is designed to emulate client load for a MySQL server and report the timing of each stage. It works as if multiple clients are accessing the server.

- Added the `--bdb-data-direct` and `--bdb-log-direct` server options.
- Added the `myisam_use_mmap` [504] system variable.

Bugs Fixed

- **MySQL Cluster**: The `--ndb` [385] option for `perror` did not function. (Bug #15486)
- **MySQL Cluster**: Using `ORDER BY primary_key_column` when selecting from a table having the primary key on a `VARCHAR` column caused a forced shutdown of the cluster. (Bug #15240, Bug #15682, Bug #14828, Bug #15517)
- Multiple-table update operations were counting updates and not updated rows. As a result, if a row had several updates it was counted several times for the “rows matched” value but updated only once. (Bug #15028)
- `ANALYZE TABLE` did not properly update table statistics for a `MyISAM` table with a `FULLTEXT` index containing stopwords, so a subsequent `ANALYZE TABLE` would not recognize the table as having already been analyzed. (Bug #14902)
- Server could not be built on default Debian systems with BDB enabled. (Bug #15734)
- For binary string data types, `mysqldump --hex-blob` produced an illegal output value of `0x` rather than `''`. (Bug #13318)
- A left join on a column that having a `NULL` value could cause the server to crash. (Bug #15268)
- `SELECT` queries that began with an opening parenthesis were not being placed in the query cache. (Bug #14652)
- Creating a view within a stored procedure could result in an out of memory error or a server crash. (Bug #14885)
- Some comparisons for the `IN()` [942] operator were inconsistent with equivalent comparisons for the `=` operator. (Bug #12612)
- `BDB`: A `DELETE`, `INSERT`, or `UPDATE` of a `BDB` table could cause the server to crash where the query contained a subquery using an index read. (Bug #15536)
- `ROW_COUNT()` [1038] returned an incorrect result after `EXECUTE` of a prepared statement. (Bug #14956)
- The `BLACKHOLE` storage engine did not handle transactions properly: Rolled-back transactions were written to the binary log. Now they ae not. (Bug #15406)
- Space truncation was being ignored when inserting into `BINARY` or `VARBINARY` columns. Now space truncation results in a warning, or an error in strict mode. (Bug #14299)
- `SHOW ENGINES` output showed the `FEDERATED` engine as `DISABLED` even for builds with `FEDERATED` support. (Bug #15559)
- Creating a view that referenced a stored function that selected from a view caused a crash upon selection from the view. (Bug #15096)
- Selecting from a view processed with the temptable algorithm caused a server crash if the query cache was enabled. (Bug #15119)
- The maximum value of `MAX_ROWS` was handled incorrectly on 64-bit systems. (Bug #14155)
- It was not possible to reorganize a partition reusing a discarded partition name.

  Now, for example, you can create a table such as this one:

```
CREATE TABLE t1 (a INT)
    PARTITION BY RANGE (a) (
```

```
      PARTITION p0 VALUES LESS THAN (10),
      PARTITION p1 VALUES LESS THAN (20),
      PARTITION p2 VALUES LESS THAN MAXVALUE
    );
```

and then repartition it as shown here:

```
ALTER TABLE t1 REORGANIZE PARTITION p2 INTO (
    PARTITION p2 VALUES LESS THAN (30)
);
```

Previously, attempting to do so would produce the error `All partitions must have unique names in the table` . (Bug #15521)

- `mysql` ignored the `MYSQL_TCP_PORT` environment variable. (Bug #5792)
- `SHOW CREATE DATABASE` was sometimes refused when the client had privileges for the database. (Bug #9785)
- Attempts to assign `NULL` to a `NOT NULL` column in strict mode now result in a message of `Column 'col_name' cannot be null`, rather than `Column set to default value; NULL supplied to NOT NULL column 'col_name' at row n`. (Bug #11491)
- Invalid casts to `DATE` values now result in a message of `Incorrect datetime value`, rather than `Truncated incorrect datetime value`. (Bug #8294)

Changes in MySQL 5.1.3 (2005-11-29)

Functionality Added or Changed

- **Plugin API**: **Incompatible Change**: MySQL 5.1 adds support for a very flexible plugin API that enables loading and unloading of various components at runtime, without restarting the server. Although the work on this is not finished yet, *plugin full-text parsers* are a first step in this direction. This enables users to implement their own input filter on the indexed text, enabling full-text search capability on arbitrary data such as PDF files or other document formats. A pre-parser full-text plugin performs the actual parsing and extraction of the text and hands it over to the built-in MySQL full-text search. (Author: Sergey Vojtovich)

  The plugin API requires the `mysql.plugin` table. When upgrading from an older version of MySQL, you should run the `mysql_fix_privilege_tables` command to create this table. See `mysql_fix_privilege_tables` — Upgrade MySQL System Tables.

  Plugins are installed in the directory named by the `plugin_dir` [510] system variable. This variable also controls the location from which the server loads user-defined functions (UDFs), which is a change from earlier versions of MySQL. That is, all UDF library files now must be installed in the plugin directory. When upgrading from an older version of MySQL, you must migrate your UDF files to the plugin directory.

- **Incompatible Change**: Renamed the `table_cache` [529] system variable to `table_open_cache` [530]. Any scripts that refer to `table_cache` [529] should be updated to use the new name.
- **MySQL Cluster**: `VARCHAR` columns used in MySQL Cluster tables are now variable-sized; that is, they now only allocate as much space as required to store the data. Previously, a `VARCHAR(n)` column allocated n+2 bytes (aligned to 4 bytes), regardless of whether the actual inserted value required that much space. (In other words, a `VARCHAR` column always required the same, fixed, amount of storage as a `CHAR` column of the same size.)
- **Partitioning**: MySQL Server now supports user-defined table partitioning, which enables distributing portions of individual tables across a file system, according to rules which can be set when the table is created. In effect, different portions of a table are stored as separate tables in different locations, but from the user point of view, the partitioned table is still a single table. See Chapter 18, *Partitioning*, for further information on this functionality. (Author: Mikael Ronström)

- `RAND()` [975] no longer permits nonconstant initializers. (Previously, the effect of nonconstant initializers is undefined.) (Bug #6172)
- The performance of boolean full-text searches (using the "+" Operator) has been improved. See Full-Text Search Functions, for more details about full-text searching. (Author: Sergey Vojtovich)
- Added the `SHOW FUNCTION CODE` and `SHOW PROCEDURE CODE` statements (available only for servers that have been built with debugging support). See `SHOW PROCEDURE CODE` Syntax.
- `SHOW instance_name LOG {ERROR | SLOW | GENERAL} size` retrieves a part of the specified log file. (Author: Petr Chardin)
- **The Instance Manager (IM)** now has some additional functionality:
  - `SHOW instance_name LOG FILES` provides a listing of all log files used by the instance. (Author: Petr Chardin)
  - `SHOW instance_name LOG {ERROR | SLOW | GENERAL} size` retrieves a part of the specified log file. (Author: Petr Chardin)
  - `SET instance_name. option_name=option_value` sets an option to the specified value and writes it to the config file See `mysqlmanager` — The MySQL Instance Manager, for more details on these new commands. (Author: Petr Chardin)
- Fast `ALTER TABLE`: Operations that change only table metadata and not table data do not require a temporary table to be used, which improves performance. For example, renaming a column changes only the `.frm` file and no longer uses a temporary table.
- Added the `SHOW AUTHORS` statement.
- `SHOW instance_name LOG FILES` provides a listing of all log files used by the instance. (Author: Petr Chardin)
- `SET instance_name. option_name=option_value` sets an option to the specified value and writes it to the config file See `mysqlmanager` — The MySQL Instance Manager, for more details on these new commands. (Author: Petr Chardin)
- Added the `table_definition_cache` [529] system variable. If you use a large number of tables, you can create a large table definition cache to speed up opening of tables. The table definition cache takes less space and does not use file descriptors, unlike the normal table cache.

Bugs Fixed

- `RESET MASTER` failed to delete log files on Windows. One consequence of this change is that server opens the general query and slow log files in shared mode, so now they can be renamed while the server has them open (something not true in previous versions). (Bug #13377)
- Set functions could not be aggregated in outer subqueries. (Bug #12762)

Changes in MySQL 5.1.2 (Not released)

Functionality Added or Changed

- Added the `bdb_cache_parts` and `bdb_region_size` system variables, and permitted `bdb_cache_size` to be larger than 4GB on systems that support it. (Bug #14895)
- Added `MAXLOCKS`, `MINLOCKS`, `MAXWRITE`, and `MINWRITE` as permissible values of the `--bdb-lock-detect` option. (Bug #14876)
- Added `Transactions`, `XA`, and `Savepoints` columns to `SHOW ENGINES` output.
- Added `--replace` [300] to `mysqldump`. This option uses `REPLACE INTO`, rather than `INSERT INTO`, when writing the dumpfile.

Bugs Fixed

- Foreign keys were not properly enforced in `TEMPORARY` tables. Foreign keys are no longer permitted in `TEMPORARY` tables. (Bug #12084)

Changes in MySQL 5.1.1 (Not released)

Functionality Added or Changed

- The `mysql_tableinfo` script has been removed. Information similar to that produced by this script is available from tables in the `INFORMATION_SCHEMA` database.

Bugs Fixed

- **Partitioning**: **MySQL Cluster**: Specifying the wrong nodegroup in a `CREATE TABLE` statement using partitioning would lead to the table name being locked after the statement failed (that is, the table name could not be re-used). (Bug #12114)
- When two threads competed for the same table, a deadlock could occur if one thread also had a lock on another table through `LOCK TABLES` and the thread was attempting to remove the table in some manner while the other thread tried to place locks on both tables. (Bug #10600)
- Performing a `CREATE TABLE` statement with a `PARTITION BY` clause in a prepared statement could crash a server running in debug mode. (Bug #12097)
- Using `ORDER BY` in a query with a partitioned table on a 64-bit operating system could crash the server. (Bug #12116)

MySQL Connector/ODBC (MyODBC) Change History

Changes in MySQL Connector/ODBC Version 5.2.x

MySQL Connector/ODBC offers the choice of a Unicode-enabled or ANSI driver, both built on the same modern, ODBC-compliant codebase. Consider upgrading if you have remained on Connector/ODBC 3.51 because of the performance edge of the ANSI driver.

Changes in MySQL Connector/ODBC 5.2.2 (2012-09-20)

This is the first GA release for the Connector/ODBC 5.2.x series. Now the available downloads include both a Unicode driver and an ANSI driver based on the same modern codebase. Server-side stored procedures are enabled by default.

Functionality Added or Changed

- The implementation of the `SQLBindParameter()` function was enhanced to support “out” and “inout” parameters when calling stored procedures. Designate the bind parameters intended to hold output values from stored procedures using the type specifiers `SQL_PARAM_OUTPUT` or `SQL_PARAM_INPUT_OUTPUT`.

  Note

  Currently, the support for “out” and “inout” parameters does not apply to `LONGTEXT` and `LONGBLOB` columns.

- Server-side prepared statements are now enabled by default. To revert to the former behavior, using client-side emulation for prepared statemnts, specify the `NO_SSPS` option when configuring the DSN.
- The download page now offers choices of a Unicode driver or an ANSI driver. Now users can get an ANSI driver with the combination of high performance and the latest standard-compliant behavior, rather than staying on the older 3.51 codebase.

Changes in MySQL Connector/ODBC Version 5.1.x

Changes in MySQL Connector/ODBC 5.1.11 (2012-04-30)

Functionality Added or Changed

- A new connection option, `prefetch`, allows applications to scroll through large query result sets, *`N`* records at a time. See Connector/ODBC Connection Parameters for details.

Bugs Fixed

- The `SQLTables()` function did not return the catalog correctly if the wildcard or `SQL_ALL_CATALOGS` was used. (Bug #13914518)
- The `fraction` member in `SQL_TIMESTAMP_STRUCT` was always set to 0 when a timestamp was retrieved using `SQLGetData()`. The fix causes the `fraction` member to be correctly set, with a value representing nanoseconds. This issue did not occur when a result was retrieved as a string (`SQLGetData()` with `SQL_C_CHAR`). (Bug #12767740, Bug #60646)
- Fractional seconds part of timestamp was ignored in prepared statements that use `SQLBindParameter` and `SQL_C_TIMESTAMP` type. For example, a prepared query comparing two timestamp values that only differed in the fractional part would consider the values identical. (Bug #12767761, Bug #60648)
- On Windows platforms, some memory was leaked on each connection attempt due to an incorrect response to a `SQLGetDiagRec()` call. (Bug #11766029, Bug #59059)

Changes in MySQL Connector/ODBC 5.1.10 (2012-02-02)

Bugs Fixed

- `SQLFetch` has to return error if indicator pointer is `NULL` for `NULL` value. (Bug #13542600)
- In some cases, a `TIMESTAMP` field could be described as `SQL_NO_NULLS`. (Bug #13532987)
- A failure on one statement causes another statement to fail. (Bug #13097201, Bug #62657)

Changes in MySQL Connector/ODBC 5.1.9 (2011-10-06)

Only the source code and Windows binaries are available with this release.

The 64-bit MSI installer no longer contains 32-bit and 64-bit builds of the driver, like it did in previous versions. It now only includes 64-bit support.

Pluggable Authentication Notes

- The binaries for this distribution of Connector/ODBC can now connect to MySQL server accounts that use the PAM or Windows Native Authentication Plugins for authentication. See The PAM Authentication Plugin, and The Windows Native Authentication Plugin. These capabilities result from linking the Connector/ODBC binaries against the MySQL 5.5.16 `libmysql` rather than the MySQL 5.1 `libmysql` used previously. The newer `libmysql` includes the client-side support needed for the server-side PAM and Windows authentication plugins.

Bugs Fixed

- Some catalog functions (such as `SQLColumns()`, `SQLStatistics()`, and `SQLPrimaryKeys()`) would only return one row, when called after pre-execution failed. (Bug #12824839)
- The CLI installer script `mysqlodbc-installer` was missing documentation about how to configure the optional data source parameters. (Bug #12810058)
- The `Install.bat` script contained leftover `3.51` information, and did not properly install the `5.1` Connector/ODBC connector. (Bug #12781039)

- With the option `charset=cp1251` specified in the connection string, the results could be returned as `CP1251` or as `UTF8` depending on the query. For example, these queries could give results in different code pages:

```
select if(1=1,'string in cp1251 code page',0) as 'string in cp1251 code page';
select 'string in cp1251 code page' as 'string in cp1251 code page';
```

  (Bug #11765110, Bug #58038)

- An off-by-one error, where `sqlwcharchr` might read one `SQLWCHAR` after the end of a string. (Bug #61586)

- `SQLExecute` would return `SQL_SUCCESS_WITH_INFO` instead of `SQL_ERROR`, when column parameter binding was enabled. (Bug #59772)

- The Connector/ODBC driver did not call `mysql_thread_end()` when a thread ended, which caused error messages like: `Error in my_thread_global_end(): 1 threads didn't exit`. (Bug #57727)

- When using MySQL Connector/ODBC to fetch data, if a `net_write_timeout` condition occurred, the operation returned the standard "end of data" status, rather than an error. (Bug #39878)

- MS Access fields with `VARCHAR NOT NULL` columns could not be altered. (Bug #31067)

Changes in MySQL Connector/ODBC 5.1.8 (2010-11-07)

Functionality Added or Changed

- Documentation in `.CHM` and `.HLP` format has been removed from the distribution. (Bug #56232)

Bugs Fixed

- When used after a call to `SQLTables()`, `SQLRowCount()` did not return the correct value. (Bug #55870)

- When attempting to install the latest Connector/ODBC 5.1.6 on Windows using the MSI, with an existing 5.1.x version already installed, the following error was generated:

```
Another version of this product is already installed.  Installation of this version
cannot continue.  To configure or remove the existing version of this product, use
Add/Remove Programs on the Control Panel.
```

  Also, the version number displayed in the ODBC Data Source Administrator/Drivers tab did not get updated when removing or installing a new version of 5.1.x. (Bug #54314)

- For some procedure and parameter combinations `SQLProcedureColumns()` did not work correctly. For example, it could not return records for an existing procedure with correct parameters supplied.

  Further, it returned incorrect data for column 7, `TYPE_NAME`. For example, it returned `VARCHAR(20)` instead of `VARCHAR`. (Bug #57182)

- After installing MySQL Connector/ODBC, the system DSN created could not be configured or deleted. An error dialog was displayed, showing the error message “Invalid attribute string”.

  In this case the problem was due to the fact that the driver could not parse the NULL-separated connection string. (Bug #56233)

- The MySQL Connector/ODBC MSI installer did not set the `InstallLocation` value in the Microsoft Windows registry. (Bug #56978)

- In bulk upload mode, `SQLExecute` would return `SQL_SUCCESS`, even when the uploaded data contained errors, such as primary key duplication, and foreign key violation. (Bug #56804)

- `SQLDescribeCol` and `SQLColAttribute` could not be called before `SQLExecute`, if the query was parameterized and not all parameters were bound.

  Note, MSDN states that “For performance reasons, an application should not call `SQLColAttribute/SQLDescribeCol` before executing a statement.” However, it should still be possible to do so if performance reasons are not paramount. (Bug #56717)

- When `SQLNumResultCols()` was called between `SQLPrepare()` and `SQLExecute()` the driver ran `SET @@sql_select_limit=1`, which limited the resultset to just one row. (Bug #56677)

Changes in MySQL Connector/ODBC 5.1.7 (2010-08-24)

Functionality Added or Changed

- MySQL Connector/ODBC has been changed to support the `CLIENT_INTERACTIVE` flag. (Bug #48603)

Bugs Fixed

- `SQLColAttribute(SQL_DESC_PRECISION...)` function returned incorrect results for type identifiers that have a negative value:

```
#define SQL_LONGVARCHAR       (-1) returned 4294967295
#define SQL_BINARY            (-2) returned 4294967294
#define SQL_VARBINARY         (-3) returned 4294967293
#define SQL_LONGVARBINARY     (-4) returned 4294967292
#define SQL_BIGINT            (-5) returned 4294967291
#define SQL_TINYINT           (-6) returned 4294967290
#define SQL_BIT               (-7) returned 4294967289
```

  They were returned as 32-bit unsigned integer values. This only happened on 64-bit Linux. (Bug #55024)

- `SQLColAttribute` for `SQL_DESC_OCTET_LENGTH` returned length including terminating null byte. It should not have included the null byte. (Bug #54206)

- When executing the `SQLProcedureColumns()` ODBC function, the driver reported the following error:

```
MySQL server does not provide the requested information
```

  (Bug #50400)

- In contrast to all other ODBC catalog functions `SQLTablePrivileges` required the user to have `SELECT` privilege on MySQL schemata, otherwise the function returned with an error:

```
SQL Error. Native Code: 1142, SQLState: HY000, Return Code: -1
[MySQL][ODBC 5.1 Driver][mysqld-5.0.67-community-nt]SELECT command denied to user
'repadmin'@'localhost' for table 'tables_priv'
[Error][SQL Error]Error executing SQLTablePrivileges for object cat: myrep, object Name:
xxxxxxxxxx
```

  (Bug #50195)

- `SQLForeignKeys()` did not return the correct information. The list of foreign keys in other tables should not have included foreign keys that point to unique constraints in the specified table. (Bug #51422)

- Retrieval of the current catalog at the moment when a connection was not ready, such as when the connection had been broken or when not all pending results had been processed, resulted in the application crashing. (Bug #46910)

- If an application was invoked by the root user, `SQLDriverConnect()` was not able to use the username and password in the connection string to connect to the database. (Bug #45378)

- The `SQLColumns` function returned the incorrect transfer octet length into the column `BUFFER_LENGTH` for `DECIMAL` type. (Bug #53235)
- Describing a view or table caused `SQLPrepare` to prefetch table data. For large tables this created an intolerable performance hit. (Bug #46411)
- Bulk upload operations did not work for queries that used parameters. (Bug #48310)
- MySQL Connector/ODBC manually added a `LIMIT` clause to the end of certain SQL statements, causing errors for statements that contained code that should be positioned after the `LIMIT` clause. (Bug #49726)
- If `NO_BACKSLASH_ESCAPES` mode was used on a server, escaping binary data led to server query parsing errors. (Bug #49029)
- Executing `SQLForeignKeys` to get imported foreign keys for tables took an excessively long time. For example, getting imported foreign keys for 252 tables to determine parent/child dependencies took about 3 minutes and 14 seconds for the 5.1.5 driver, whereas it took 3 seconds for the 3.5x.x driver. (Bug #39562)
- The `SQLTables()` function required approximately two to four minutes to return the list of 400 tables in a database. The `SHOW TABLE STATUS` query used by `SQLTables()` was extremely slow for InnoDB tables with a large number of rows because the query was calculating the approximate number of rows in each table. Further, the results could not be cached due to non-deterministic nature of the result set (the row count was re-calculated every time), impacting performance further. (Bug #43664)
- `SQLDescribeCol` returned incorrect column definitions for `SQLTables` result. (Bug #37621)
- Calling `SQLColAttribute` on a date column did not set `SQL_DESC_DATETIME_INTERVAL_CODE`. `SQLColAttribute` returned `SQL_SUCCESS` but the integer passed in was not set to `SQL_CODE_DATE`. (Bug #44576)
- Conversions for many types were missing from the file `driver/info.c`. (Bug #43855)
- When opening `ADO.Recordset` from Microsoft Access 2003, a run-time error occurred:

  ```
  ErrNo: -2147467259 ErrMessage: Data provider or other service returned an E_FAIL status.
  ```

  (Bug #36996)
- On Windows, the SOCKET parameter to the DSN was used as the named pipe name to connect to. This was not exposed in the Windows setup GUI. (Bug #34477)
- Option for handling bad dates was not available in the GUI. (Bug #30539)
- `SQLPrimaryKeysW` returned mangled strings for table name, column name and primary key name. (Bug #36441)
- MySQL Connector/ODBC returned a value of zero for a column with a non-zero value. This happened when the column had a data type of `BIT`, and any numeric type was used in `SQLBindCol`. (Bug #32821)

Changes in MySQL Connector/ODBC 5.1.6 (2009-11-09)

Functionality Added or Changed

- In the MySQL Data Source Configuration dialog, an excessive number of tabs were required to navigate to selection of a database. MySQL Connector/ODBC has been changed to make the tab order more practical, thereby enabling faster configuration of a Data Source. (Bug #42905)

Bugs Fixed

- MySQL Connector/ODBC overwrote the query log. MySQL Connector/ODBC was changed to append the log, rather than overwrite it. (Bug #44965)
- Inserting a new record using `SQLSetPos` did not correspond to the database name specified in the `SELECT` statement when querying tables from databases other than the current one.

  `SQLSetPos` attempted to do the `INSERT` in the current database, but finished with a `SQL_ERROR` result and “Table does not exist” message from MySQL Server. (Bug #41946)
- Binding `SQL_C_BIT` to an `INTEGER` column did not work.

  The `sql_get_data()` function only worked correctly for `BOOLEAN` columns that corresponded to `SQL_C_BIT` buffers. (Bug #39644)
- In Access 97, when linking a table containing a `LONGTEXT` or `TEXT` field to a MySQL Connector/ODBC DSN, the fields were shown as `TEXT(255)` in the table structure. Data was therefore truncated to 255 characters. (Bug #40932)
- An error randomly occurred on Windows 2003 Servers (German language Version) serving classic ASP scripts on IIS6 MDAC version 2.8 SP2 on Windows 2003 SP2. The application connected to MySQL Server 5.0.44-log with a charset of UTF-8 Unicode (utf8). The MySQL server was running on Gentoo Linux.

  The script error occurred sporadically on the following line of code:

  ```
  SET my_conn = Server.CreateObject("ADODB.Connection")
  my_conn.Open ConnString  <- ERROR
  ```

  The connection was either a DSN or the explicit connection string:

  ```
  Driver={MySQL ODBC 5.1 Driver};SERVER=abc.abc.abc.abc;DATABASE=dbname;UID=uidname;PWD=pwdname;PORT=3306;O
  ```

  The error occurred on connections established using either a DNS or a connection string.

  When IISState and Debug Diagnostic Tool 1.0.0.152 was used to analyse the code, the following crash analysis was generated:

  ```
  MYODBC5!UTF16TOUTF32+6In 4640-1242788336.dmp the assembly instruction at
  myodbc5!utf16toutf32+6 in C:\Programme\MySQL\Connector ODBC 5.1\myodbc5.dll from MySQL AB
  has caused an access violation exception (0xC0000005) when trying to read from memory
  location 0x194dd000 on thread 33
  ```

  (Bug #44971)
- When a column of type `DECIMAL` containing `NULL` was accessed, MySQL Connector/ODBC returned a 0 rather than a `NULL`. (Bug #41081)
- MySQL Connector/ODBC updated some fields with random values, rather than with `NULL`. (Bug #41256)
- Calling `SQLDescribeCol()` with a NULL buffer and nonzero buffer length caused a crash. (Bug #41942)
- MySQL Connector/ODBC failed to build with MySQL 5.1.30 due to incorrect use of the data type `bool`. (Bug #42120)
- The connection string option `Enable Auto-reconnect` did not work. When the connection failed, it could not be restored, and the errors generated were the same as if the option had not been selected. (Bug #37179)
- Connector/ODBC would crash when a character set was being used on the server that was not supported in the client, for example cp1251:

  ```
  [MySQL][ODBC 5.1 Driver][mysqld-5.0.27-community-nt]Restricted data type attribute violation
  ```

The fix causes Connector/ODBC to return an error message instead of crashing. (Bug #39831)

- Connector/ODBC 5.1.5 was not able to connect if the connection string parameters contained spaces or tab symbols. For example, if the `SERVER` parameter was specified as “SERVER= localhost” instead of “SERVER=localhost” the following error message will be displayed:

```
[MySQL][ODBC 5.1 Driver] Unknown MySQL server host ' localhost' (11001).
```

(Bug #39085)

- Setting the ADO `Recordset` decimal field value to 44.56 resulted in an incorrect value of 445600.0000 being stored when the record set was updated with the `Update` method. (Bug #39961)

- The `SQLTablesW` API gave incorrect results. For example, table name and table type were returned as `NULL` rather than as the correct values. (Bug #39957)

- Calling `SQLDriverConnect()` with a `NULL` pointer for the output buffer caused a crash if `SQL_DRIVER_NOPROMPT` was also specified:

```
SQLDriverConnect(dbc, NULL, "DSN=myodbc5", SQL_NTS, NULL, 0, NULL, SQL_DRIVER_NOPROMPT)
```

(Bug #40316)

- Data-at-execution parameters were not supported during positioned update. This meant updating a long text field with a cursor update would erroneously set the value to null. This would lead to the error `Column 'column_name' cannot be null` while updating the database, even when `column_name` had been assigned a valid nonnull string. (Bug #37649)

- The pointer passed to the `SQLDriverConnect` method to retrieve the output connection string length was one greater than it should have been due to the inclusion of the NULL terminator. (Bug #38949)

- The `SQLDriverConnect` method truncated the `OutputConnectionString` parameter to 52 characters. (Bug #37278)

- The `SQLGetInfo()` function returned 0 for `SQL_CATALOG_USAGE` information. (Bug #39560)

- When the `SQLTables` method was called with `NULL` passed as the `tablename` parameter, only one row in the `resultset`, with table name of `NULL` was returned, instead of all tables for the given database. (Bug #39561)

- Insertion of data into a `LONGTEXT` table field did not work. If such an attempt was made the corresponding field would be found to be empty on examination, or contain random characters. (Bug #36071)

- No result record was returned for `SQLGetTypeInfo` for the `TIMESTAMP` data type. An application would receive the result `return code 100 (SQL_NO_DATA_FOUND)`. (Bug #30626)

- It was not possible to use MySQL Connector/ODBC to connect to a server using SSL. The following error was generated:

```
Runtime error '-2147467259 (80004005)':

[MySQL][ODBC 3.51 Driver]SSL connection error.
```

(Bug #29955)

- When the `recordSet.Update` function was called to update an `adLongVarChar` field, the field was updated but the recordset was immediately lost. This happened with driver cursors, whether the cursor was opened in optimistic or pessimistic mode.

  When the next update was called the test code would exit with the following error:

```
-2147467259 : Query-based update failed because the row to update could not be found.
```

(Bug #26950)

- Microsoft Access was not able to read `BIGINT` values properly from a table with just two columns of type `BIGINT` and `VARCHAR`. `#DELETE` appeared instead of the correct values. (Bug #17679)

Changes in MySQL Connector/ODBC 5.1.5 (2008-08-18)

Bugs Fixed

- The connector failed to prompt for additional information required to create a DSN-less connection from an application such as Microsoft Excel. (Bug #37254)
- ODBC `TIMESTAMP` string format is not handled properly by Connector/ODBC. When passing a `TIMESTAMP` or `DATE` to Connector/ODBC, in the ODBC format: {d <date>} or {ts <timestamp>}, the string that represents this is copied once into the SQL statement, and then added again, as an escaped string. (Bug #37342)
- Assigning a string longer than 67 characters to the `TableType` parameter resulted in a buffer overrun when the `SQLTables()` function was called. (Bug #36275)
- After having successfully established a connection, a crash occurs when calling `SQLProcedures()` followed by `SQLFreeStmt()`, using the ODBC C API. (Bug #36069)
- `SQLDriverConnect` does not return `SQL_NO_DATA` on cancel. The ODBC documentation specifies that this method should return `SQL_NO_DATA` when the user cancels the dialog to connect. The connector, however, returns `SQL_ERROR`. (Bug #36293)
- The ODBC connector randomly uses logon information stored in `odbc-profile`, or prompts the user for connection information and ignores any settings stored in `odbc-profile`. (Bug #36203)

Changes in MySQL Connector/ODBC 5.1.4 (2008-04-15)

Bugs Fixed

- Wrong result obtained when using `sum()` on a `decimal(8,2)` field type. (Bug #35920)
- The driver crashes ODBC Administrator on attempting to add a new DSN. (Bug #32057)
- The driver installer could not create a new DSN if many other drivers were already installed. (Bug #35776)
- On Linux, `SQLGetDiagRec()` returned `SQL_SUCCESS` in cases when it should have returned `SQL_NO_DATA`. (Bug #33910)
- The `SQLColAttribute()` function returned `SQL_TRUE` when querying the `SQL_DESC_FIXED_PREC_SCALE (SQL_COLUMN_MONEY)` attribute of a `DECIMAL` column. Previously, the correct value of `SQL_FALSE` was returned; this is now again the case. (Bug #35581)

Changes in MySQL Connector/ODBC 5.1.3 (2008-03-26)

Platform-Specific Notes

- **Important Change**: You must uninstall previous 5.1.x editions of MySQL Connector/ODBC before installing the new version.
- The installer for 64-bit Windows installs both the 32-bit and 64-bit driver. Please note that Microsoft does not yet supply a 64-bit bridge from ADO to ODBC.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.

- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.

Bugs Fixed

- **Important Change**: In previous versions, the SSL certificate would automatically be verified when used as part of the MySQL Connector/ODBC connection. The default mode is now to ignore the verificate of certificates. To enforce verification of the SSL certificate during connection, use the `SSLVERIFY` DSN parameter, setting the value to 1. (Bug #29955, Bug #34648)
- Microsoft Access would be unable to use `DBEngine.RegisterDatabase` to create a DSN using the MySQL Connector/ODBC driver. (Bug #33825)
- Using `SqlGetData` in combination with `SQL_C_WCHAR` would return overlapping data. (Bug #34429)
- Inserting characters to a UTF8 table using surrogate pairs would fail and insert invalid data. (Bug #34672)
- MySQL Connector/ODBC erroneously reported that it supported the `CAST()` and `CONVERT()` ODBC functions for parsing values in SQL statements, which could lead to bad SQL generation during a query. (Bug #33808)
- The dropdown selection for databases on a server when creating a DSN was too small. The list size now automatically adjusts up to a maximum size of 20 potential databases. (Bug #33918)
- Installation of MySQL Connector/ODBC would fail because it was unable to uninstall a previous installed version. The file being requested would match an older release version than any installed version of the connector. (Bug #34522)
- Descriptor records were not cleared correctly when calling `SQLFreeStmt(SQL_UNBIND)`. (Bug #34271)
- Using a linked table in Access 2003 where the table has a `BIGINT` column as the first column in the table, and is configured as the primary key, shows `#DELETED` for all rows of the table. (Bug #24535)
- Updating a `RecordSet` when the query involves a `BLOB` field would fail. (Bug #19065)

Changes in MySQL Connector/ODBC 5.1.2 (2008-02-13)

MySQL Connector/ODBC 5.1.2-beta, a new version of the ODBC driver for the MySQL database management system, has been released. This release is the second beta (feature-complete) release of the new 5.1 series and is suitable for use with any MySQL server version since MySQL 4.1, including MySQL 5.0, 5.1, and 6.0. (It will not work with 4.0 or earlier releases.)

Keep in mind that this is a beta release, and as with any other pre-production release, caution should be taken when installing on production level systems or systems with critical data.

Platform-Specific Notes

- Due to differences with the installation process used on Windows and potential registry corruption, it is recommended that uninstall any existing versions of MySQL Connector/ODBC 5.1.x before upgrading.

  References: See also Bug #34571.

- The installer for 64-bit Windows installs both the 32-bit and 64-bit driver. Please note that Microsoft does not yet supply a 64-bit bridge from ADO to ODBC.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.

Functionality Added or Changed

- Explicit descriptors are implemented. (Bug #32064)
- `SQLForeignKeys` uses `INFORMATION_SCHEMA` when it is available on the server, which enables more complete information to be returned.
- Disabled `MYSQL_OPT_SSL_VERIFY_SERVER_CERT` when using an SSL connection.
- Changed `SQL_ATTR_PARAMSET_SIZE` to return an error until support for it is implemented.
- A full implementation of SQLForeignKeys based on the information available from INFORMATION_SCHEMA in 5.0 and later versions of the server has been implemented.

Bugs Fixed

- Specifying a nonexistent database name within the GUI dialog would result in an empty list, not an error. (Bug #33615)
- The `SSLCIPHER` option would be incorrectly recorded within the SSL configuration on Windows. (Bug #33897)
- Within the GUI interface, when connecting to a MySQL server on a nonstandard port, the connection test within the GUI would fail. The issue was related to incorrect parsing of numeric values within the DSN when the option was not configured as the last parameter within the DSN. (Bug #33822)
- When deleting rows from a static cursor, the cursor position would be incorrectly reported. (Bug #33388)
- Retrieving data from a `BLOB` column would fail within `SQLGetData`when the target data type was `SQL_C_WCHAR` due to incorrect handling of the character buffer. (Bug #32684)
- `SQLGetInfo()` reported characters for `SQL_SPECIAL_CHARACTERS` that were not encoded correctly. (Bug #33130)
- Renaming an existing DSN entry would create a new entry with the new name without deleting the old entry. (Bug #31165)
- Reading a `TEXT` column that had been used to store UTF8 data would result in the wrong information being returned during a query. (Bug #28617)
- When accessing column data, `FLAG_COLUMN_SIZE_S32` did not limit the octet length or display size reported for fields, causing problems with Microsoft Visual FoxPro.

  The list of ODBC functions that could have caused failures in Microsoft software when retrieving the length of `LONGBLOB` or `LONGTEXT` columns includes:

  - `SQLColumns`
  - `SQLColAttribute`
  - `SQLColAttributes`
  - `SQLDescribeCol`
  - `SQLSpecialColumns` (theoretically can have the same problem)

  (Bug #12805, Bug #30890)
- `SQLForeignKeys` would return an empty string for the schema columns instead of `NULL`. (Bug #19923)
- Dynamic cursors on statements with parameters were not supported. (Bug #11846)

- Evaluating a simple numeric expression when using the OLEDB for ODBC provider and ADO would return an error, instead of the result. (Bug #10128)
- Adding or updating a row using `SQLSetPos()` on a result set with aliased columns would fail. (Bug #6157)

Changes in MySQL Connector/ODBC 5.1.1 (2007-12-13)

MySQL Connector/ODBC 5.1.1-beta, a new version of the ODBC driver for the MySQL database management system, has been released. This release is the first beta (feature-complete) release of the new 5.1 series and is suitable for use with any MySQL server version since MySQL 4.1, including MySQL 5.0, 5.1, and 6.0. (It will not work with 4.0 or earlier releases.)

Keep in mind that this is a beta release, and as with any other pre-production release, caution should be taken when installing on production level systems or systems with critical data.

Includes changes from Connector/ODBC 3.51.21 and 3.51.22.

Built using MySQL 5.0.52.

Platform-Specific Notes

- Due to differences with the installation process used on Windows and potential registry corruption, it is recommended that uninstall any existing versions of MySQL Connector/ODBC 5.1.x before upgrading.

  References: See also Bug #34571.
- The installer for 64-bit Windows installs both the 32-bit and 64-bit driver. Please note that Microsoft does not yet supply a 64-bit bridge from ADO to ODBC.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.

Functionality Added or Changed

- **Incompatible Change**: Do not permit `SET NAMES` in initial statement and in executed statements.
- **Incompatible Change**: Removed monitor (myodbc3m) and dsn-editor (myodbc3c).
- **Incompatible Change**: Replaced myodbc3i (now myodbc-installer) with MySQL Connector/ODBC 5.0 version.
- Added MSI installer for Windows 64-bit. (Bug #31510)
- A wrapper for the `SQLGetPrivateProfileStringW()` function, which is required for Unicode support, has been created. This function is missing from the unixODBC driver manager. (Bug #32685)
- Implemented support for `SQLCancel()`. (Bug #15601)
- The Windows installer now places files in a subdirectory of the `Program Files` directory instead of the Windows system directory.
- Replaced the internal library which handles creation and loading of DSN information. The new library, which was originally a part of MySQL Connector/ODBC 5.0, supports Unicode option values.
- Implemented native Windows setup library
- Added support for `SQL_NUMERIC_STRUCT`. (Bug #3028, Bug #24920)

- Removed nonthreadsafe configuration of the driver. The driver is now always built against the threadsafe version of libmysql.

Bugs Fixed

- ADO was unable to open record set using dynamic cursor. (Bug #32014)
- `SQLDescribeColW` returned UTF-8 column as `SQL_VARCHAR` instead of `SQL_WVARCHAR`. (Bug #32161)
- `SQLSetPos` with `SQL_DELETE` advances dynamic cursor incorrectly. (Bug #29765)
- ADO applications would not open a `RecordSet` that contained a `DECIMAL` field. (Bug #31720)
- Using an ODBC prepared statement with bound columns would produce an empty result set when called immediately after inserting a row into a table. (Bug #29239)
- The `SET NAMES` statement has been disabled because it causes problems in the ODBC driver when determining the current client character set. (Bug #32596)
- Memory usage would increase considerably. (Bug #31115)
- SQL statements are limited to 64KB. (Bug #30983, Bug #30984)
- Recordset `Update()` fails when using `adUseClient` cursor. (Bug #26985)
- ADO Not possible to update a client side cursor. (Bug #27961)
- MySQL Connector/ODBC would fail to connect to the server if the password contained certain characters, including the semicolon and other punctuation marks. (Bug #16178)
- Diagnostics were not correctly cleared on connection and environment handles.
- `SQLCopyDesc()` did not correctly copy all records.
- `SQL_ODBC_SQL_CONFORMANCE` was not handled by `SQLGetInfo()`.
- NULL pointers passed to `SQLGetInfo()` could result in a crash.
- `SQLError()` incorrectly cleared the error information, making it unavailable from subsequent calls to `SQLGetDiagRec()`.
- `SQLSetConnectAttr()` did not clear previous errors, possibly confusing `SQLError()`.
- Fixed `SQL_ATTR_PARAM_BIND_OFFSET`, and fixed row offsets to work with updatable cursors.

Changes in MySQL Connector/ODBC 5.1.0 (2007-09-10)

This release is the first of the new 5.1 series and is suitable for use with any MySQL server version since MySQL 4.1, including MySQL 5.0, 5.1, and 6.0. (It will not work with 4.0 or earlier releases.)

Keep in mind that this is a alpha release, and as with any other pre-production release, caution should be taken when installing on production level systems or systems with critical data. Not all of the features planned for the final Connector/ODBC 5.1 release are implemented.

Functionality is based on Connector/ODBC 3.51.20.

Platform-Specific Notes

- Due to differences with the installation process used on Windows and potential registry corruption, it is recommended that uninstall any existing versions of MySQL Connector/ODBC 5.1.x before upgrading.

  References: See also Bug #34571.

- There are no installer packages for Microsoft Windows x64 Edition.

- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.

Functionality Added or Changed

- Added support for `SQL_C_WCHAR`.
- Added descriptor support (`SQLGetDescField`, `SQLGetDescRec`, etc).
- Added support for Unicode functions (`SQLConnectW`, etc).

Changes in MySQL Connector/ODBC Version 5.0.x

Changes in MySQL Connector/ODBC 5.0.12 (Never released)

Note

Development on Connector/ODBC 5.0.x has ceased. New features and functionality will be incorporated into Connector/ODBC 5.1.

Version 5.0.12 has no changelog entries.

Changes in MySQL Connector/ODBC 5.0.11 (2007-01-31)

Functionality Added or Changed

- Driver now builds and is partially tested under Linux with the iODBC driver manager.
- Added support for ODBC v2 statement options using attributes.

Bugs Fixed

- Transaction support has been added and tested. (Bug #25045)
- Updates of `MEMO` or `TEXT` columns from within Microsoft Access would fail. (Bug #25263)
- Internal function, `my_setpos_delete_ignore()` could cause a crash. (Bug #22796)
- Connection string parsing for DSN-less connections could fail to identify some parameters. (Bug #25316)
- Fixed the binding of certain integer types.
- Fixed occasional mis-handling of the `SQL_NUMERIC_C` type.

Changes in MySQL Connector/ODBC 5.0.10 (2006-12-14)

Connector/ODBC 5.0.10 is the sixth BETA release.

Functionality Added or Changed

- Significant performance improvement when retrieving large text fields in pieces using `SQLGetData()` with a buffer smaller than the whole data. Mainly used in Access when fetching very large text fields. (Bug #24876)
- Added initial support for removing braces when calling stored procedures and retrieving result sets from procedure calls. (Bug #24485)
- Added initial unicode support in data and metadata. (Bug #24837)
- Added loose handling of retrieving some diagnostic data. (Bug #15782)

- Added wide-string type info for `SQLGetTypeInfo()`.

Bugs Fixed

- Editing DSN no longer crashes ODBC data source administrator. (Bug #24675)
- String query parameters are new escaped correctly. (Bug #19078)

Changes in MySQL Connector/ODBC 5.0.9 (2006-11-22)

Connector/ODBC 5.0.9 is the fifth BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

Functionality Added or Changed

- Added recognition of `SQL_C_SHORT` and `SQL_C_TINYINT` as C types.
- Added support for column binding as SQL_NUMERIC_STRUCT.

Bugs Fixed

- Fixed SQLGetData to clear the NULL indicator correctly during multiple calls.
- Corrected retrieval multiple field types bit and blob/text.
- Fixed statistics to fail if it couldn't be completed.
- Catch use of `SQL_ATTR_PARAMSET_SIZE` and report error until we fully support.
- ODBC v2 behavior in driver now supports ODBC v3 date/time types (since DriverManager maps them).
- Fixed buffer length return for SQLDriverConnect.
- Added limit of display size when requested using `SQLColAttribute`/`SQL_DESC_DISPLAY_SIZE`.
- Fixed wildcard handling of and listing of catalogs and tables in `SQLTables`.

Changes in MySQL Connector/ODBC 5.0.8 (2006-11-17)

Connector/ODBC 5.0.8 is the fourth BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

Functionality Added or Changed

- Wildcards now support escaped chars and underscore matching (needed to link tables with underscores in access).
- Made distinction between `CHAR`/`BINARY` (and VAR versions).
- Fixed display size to be length if max length isn’t available.
- Also made `SQL_DESC_NAME` only fill in the name if there was a data pointer given, otherwise just the length.

Bugs Fixed

- Fixed string length to chars, not bytes, returned by SQLGetDiagRec.
- Fix size return from `SQLDescribeCol`.
- Fixed type returned for `MYSQL_TYPE_LONG` to `SQL_INTEGER` instead of `SQL_TINYINT`.

- Fixed handling of numeric pointers in SQLColAttribute.
- Updated retrieval of descriptor fields to use the right pointer types.
- Length now used when handling bind parameter (needed in particular for `SQL_WCHAR`) - this enables updating char data in MS Access.
- Allow SQLDescribeCol to be called to retrieve the length of the column name, but not the name itself.
- Fixed MDiagnostic to use correct v2/v3 error codes.
- Set default return to `SQL_SUCCESS` if nothing is done for `SQLSpecialColumns`.
- Fixed using wrong pointer for `SQL_MAX_DRIVER_CONNECTIONS` in `SQLGetInfo`.
- Fixed binding using `SQL_C_LONG`.

Changes in MySQL Connector/ODBC 5.0.7 (2006-11-08)

Connector/ODBC 5.0.7 is the third BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

Functionality Added or Changed

- Improved trace/log.
- Added support for `SQLStatistics` to `MYODBCShell`.

Bugs Fixed

- Fixed `SQLDescribeCol` returning column name length in bytes rather than chars.
- Corrected incorrect column index within `SQLStatistics`. Many more tables can now be linked into MS Access.
- SQLBindParameter now handles `SQL_C_DEFAULT`.

Changes in MySQL Connector/ODBC 5.0.6 (2006-11-03)

Connector/ODBC 5.0.6 is the second BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

Features, Limitations, and Notes on this Release

- You no longer have to have MySQL Connector/ODBC 3.51 installed before installing this version.
- Installation is provided in the form of a standard Microsoft System Installer (MSI).
- MySQL Connector/ODBC supports both `User` and `System` DSNs.

Bugs Fixed

- Installation is provided in the form of a standard Microsoft System Installer (MSI).
- MySQL Connector/ODBC supports both `User` and `System` DSNs.
- You no longer have to have MySQL Connector/ODBC 3.51 installed before installing this version.

Changes in MySQL Connector/ODBC 5.0.5 (2006-10-17)

Connector/ODBC 5.0.5 is the first BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

You no longer have to have Connector/ODBC 3.51 installed before installing this version.

Bugs Fixed

- You no longer have to have MySQL Connector/ODBC 3.51 installed before installing this version.

Changes in Connector/ODBC 5.0.3 (Connector/ODBC 5.0 Alpha 3) (20 June 2006)

This is an implementation and testing release, and is not designed for use within a production environment.

Features, limitations and notes on this release:

- The following ODBC API functions have been added in this release:
  - `SQLBindParameter`
  - `SQLBindCol`

Changes in Connector/ODBC 5.0.2 (Never released)

Connector/ODBC 5.0.2 was an internal implementation and testing release.

Changes in Connector/ODBC 5.0.1 (Connector/ODBC 5.0 Alpha 2) (05 June 2006)

Features, limitations and notes on this release:

- Connector/ODBC 5.0 is Unicode aware.
- Connector/ODBC is currently limited to basic applications. ADO applications and Microsoft Office are not supported.
- Connector/ODBC must be used with a Driver Manager.
- The following ODBC API functions are implemented:
  - `SQLAllocHandle`
  - `SQLCloseCursor`
  - `SQLColAttribute`
  - `SQLColumns`
  - `SQLConnect`
  - `SQLCopyDesc`
  - `SQLDisconnect`
  - `SQLExecDirect`
  - `SQLExecute`
  - `SQLFetch`
  - `SQLFreeHandle`
  - `SQLFreeStmt`

- SQLGetConnectAttr
- SQLGetData
- SQLGetDescField
- SQLGetDescRec
- SQLGetDiagField
- SQLGetDiagRec
- SQLGetEnvAttr
- SQLGetFunctions
- SQLGetStmtAttr
- SQLGetTypeInfo
- SQLNumResultCols
- SQLPrepare
- SQLRowcount
- SQLTables

The following ODBC API function are implemented, but not yet support all the available attributes/ options:

- SQLSetConnectAttr
- SQLSetDescField
- SQLSetDescRec
- SQLSetEnvAttr
- SQLSetStmtAttr

Changes in MySQL Connector/ODBC Version 3.51.x

Changes in MySQL Connector/ODBC 3.51.30 (2012-02-02)

Bugs Fixed

- After downgrading from Connector/ODBC 5.1 to Connector/ODBC 3.51, unrecognized names for connection string parameters caused warning messages about unknown options. (Bug #13647492)
- SQLFetch has to return error if indicator pointer is NULL for NULL value. (Bug #13542600)
- In some cases, a TIMESTAMP field could be described as SQL_NO_NULLS. (Bug #13532987)
- A failure on one statement causes another statement to fail. (Bug #13097201, Bug #62657)
- Describing a view or table caused SQLPrepare to prefetch table data. For large tables this created an intolerable performance hit. (Bug #46411)
- MySQL Connector/ODBC manually added a LIMIT clause to the end of certain SQL statements, causing errors for statements that contained code that should be positioned after the LIMIT clause. (Bug #49726)

Changes in MySQL Connector/ODBC 3.51.29 (2011-10-04)

Pluggable Authentication Notes

- The binaries for this distribution of Connector/ODBC can now connect to MySQL server accounts that use the PAM or Windows Native Authentication Plugins for authentication. See The PAM Authentication Plugin, and The Windows Native Authentication Plugin. These capabilities result from linking the Connector/ODBC binaries against the MySQL 5.5.16 `libmysql` rather than the MySQL 5.1 `libmysql` used previously. The newer `libmysql` includes the client-side support needed for the server-side PAM and Windows authentication plugins.

Bugs Fixed

- Some catalog functions (such as `SQLColumns()`, `SQLStatistics()`, and `SQLPrimaryKeys()`) would only return one row, when called after pre-execution failed. (Bug #12824839)
- An off-by-one error, where `sqlwcharchr` might read one `SQLWCHAR` after the end of a string. (Bug #61586)
- `SQLExecute` would return `SQL_SUCCESS_WITH_INFO` instead of `SQL_ERROR`, when column parameter binding was enabled. (Bug #59772)
- The Connector/ODBC driver did not call `mysql_thread_end()` when a thread ended, which caused error messages like: `Error in my_thread_global_end(): 1 threads didn't exit`. (Bug #57727)
- MS Access fields with `VARCHAR NOT NULL` columns could not be altered. (Bug #31067)

Changes in MySQL Connector/ODBC 3.51.28 (2011-02-09)

Bugs Fixed

- `SQLColAttribute(...SQL_DESC_CASE_SENSITIVE...)` returned `SQL_FALSE` for binary types and `SQL_TRUE` for the rest. It should have returned `SQL_TRUE` for binary types, and `SQL_FALSE` for the rest. (Bug #54212)
- `SQLColAttribute` for `SQL_DESC_OCTET_LENGTH` returned length including terminating null byte. It should not have included the null byte. (Bug #54206)
- If `NO_BACKSLASH_ESCAPES` mode was used on a server, escaping binary data led to server query parsing errors. (Bug #49029)
- When using MySQL Connector/ODBC to fetch data, if a `net_write_timeout` condition occurred, the operation returned the standard "end of data" status, rather than an error. (Bug #39878)
- Inserting a new record using `SQLSetPos` did not correspond to the database name specified in the `SELECT` statement when querying tables from databases other than the current one.

  `SQLSetPos` attempted to do the `INSERT` in the current database, but finished with a `SQL_ERROR` result and “Table does not exist” message from MySQL Server. (Bug #41946)
- No result record was returned for `SQLGetTypeInfo` for the `TIMESTAMP` data type. An application would receive the result `return code 100 (SQL_NO_DATA_FOUND)`. (Bug #30626)
- Microsoft Access was not able to read `BIGINT` values properly from a table with just two columns of type `BIGINT` and `VARCHAR`. `#DELETE` appeared instead of the correct values. (Bug #17679)

Changes in MySQL Connector/ODBC 3.51.27 (2008-11-20)

Bugs Fixed

- The client program hung when the network connection to the server was interrupted. (Bug #40407)

- The connection string option `Enable Auto-reconnect` did not work. When the connection failed, it could not be restored, and the errors generated were the same as if the option had not been selected. (Bug #37179)
- It was not possible to use MySQL Connector/ODBC to connect to a server using SSL. The following error was generated:

```
Runtime error '-2147467259 (80004005)':

[MySQL][ODBC 3.51 Driver]SSL connection error.
```

  (Bug #29955)

Changes in MySQL Connector/ODBC 3.51.26 (2008-07-07)

Functionality Added or Changed

- There is a new connection option, `FLAG_NO_BINARY_RESULT`. When set this option disables charset 63 for columns with an empty `org_table`. (Bug #29402)

Bugs Fixed

- When an `ADOConnection` is created and attempts to open a schema with `ADOConnection.OpenSchema` an access violation occurs in `myodbc3.dll`. (Bug #30770)
- When `SHOW CREATE TABLE` was invoked and then the field values read, the result was truncated and unusable if the table had many rows and indexes. (Bug #24131)

Changes in MySQL Connector/ODBC 3.51.25 (2008-04-11)

Bugs Fixed

- The driver crashes ODBC Administrator on attempting to add a new DSN. (Bug #32057)
- The `SQLColAttribute()` function returned `SQL_TRUE` when querying the `SQL_DESC_FIXED_PREC_SCALE (SQL_COLUMN_MONEY)` attribute of a `DECIMAL` column. Previously, the correct value of `SQL_FALSE` was returned; this is now again the case. (Bug #35581)
- When accessing column data, `FLAG_COLUMN_SIZE_S32` did not limit the octet length or display size reported for fields, causing problems with Microsoft Visual FoxPro.

  The list of ODBC functions that could have caused failures in Microsoft software when retrieving the length of `LONGBLOB` or `LONGTEXT` columns includes:

  - `SQLColumns`
  - `SQLColAttribute`
  - `SQLColAttributes`
  - `SQLDescribeCol`
  - `SQLSpecialColumns` (theoretically can have the same problem)

  (Bug #12805, Bug #30890)

Changes in MySQL Connector/ODBC 3.51.24 (2008-03-14)

Bugs Fixed

- **Security Enhancement**: Accessing a parameter with the type of `SQL_C_CHAR`, but with a numeric type and a length of zero, the parameter marker would get stripped from the query. In addition, an SQL injection was possible if the parameter value had a nonzero length and was not numeric, the text would be inserted verbatim. (Bug #34575)

- **Important Change**: In previous versions, the SSL certificate would automatically be verified when used as part of the MySQL Connector/ODBC connection. The default mode is now to ignore the verificate of certificates. To enforce verification of the SSL certificate during connection, use the `SSLVERIFY` DSN parameter, setting the value to 1. (Bug #29955, Bug #34648)

- When creating a System DSN using the ODBC Administrator on Mac OS X, a User DSN would be created instead. The root cause is a problem with the iODBC driver manager used on Mac OS X. The fix works around this issue.

  Note

  ODBC Administrator may still be unable to register a System DSN unless the `/Library/ODBC/odbc.ini` file has the correct permissions. You should ensure that the file is writable by the `admin` group.

  (Bug #31495)

- Calling `SQLFetch` or `SQLFetchScroll` would return negative data lengths when using `SQL_C_WCHAR`. (Bug #31220)

- Using tables with a single quote or other nonstandard characters in the table or column names through ODBC would fail. (Bug #32989)

- When using ADO, the count of parameters in a query would always return zero. (Bug #33298)

- When using Crystal Reports, table and column names would be truncated to 21 characters, and truncated columns in tables where the truncated name was the duplicated would lead to only a single column being displayed. (Bug #32864)

- When using the ODBC `SQL_TXN_READ_COMMITTED` option, 'dirty' records would be read from tables as if the option had not been applied. (Bug #31959)

- `SQLExtendedFetch()` and `SQLFetchScroll()` ignored the rowset size if the `Don't cache result` DSN option was set. (Bug #32420)

- `SQLSetParam()` caused memory allocation errors due to driver manager's mapping of deprecated functions (buffer length -1). (Bug #29871)

- Using `connection.Execute` to create a record set based on a table without declaring the cmd option as `adCmdTable` will fail when communicating with versions of MySQL 5.0.37 and higher. The issue is related to the way that `SQLSTATE` is returned when ADO tries to confirm the existence of the target object. (Bug #27158)

- Static cursor was unable to be used through ADO when dynamic cursors were enabled. (Bug #27351)

- With some connections to MySQL databases using MySQL Connector/ODBC, the connection would mistakenly report 'user cancelled' for accesses to the database information. (Bug #16653)

- Updating a `RecordSet` when the query involves a `BLOB` field would fail. (Bug #19065)

Changes in MySQL Connector/ODBC 3.51.23 (2008-01-09)

Platform-Specific Notes

- There are no installer packages for Microsoft Windows x64 Edition.

- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.

- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.

Bugs Fixed

- Renaming an existing DSN entry would create a new entry with the new name without deleting the old entry. (Bug #31165)
- Cleaning up environment handles in multithread environments could result in a five (or more) second delay. (Bug #32366)
- When using unixODBC or directly linked applications where the thread level is set to less than 3 (within `odbcinst.ini`), a thread synchronization issue would lead to an application crash. This was because `SQLAllocStmt()` and `SQLFreeStmt()` did not synchronize access to the list of statements associated with a connection. (Bug #32587)
- MySQL Connector/ODBC would incorrectly return `SQL_SUCCESS` when checking for distributed transaction support. (Bug #32727)
- Setting the default database using the `DefaultDatabase` property of an ADO `Connection` object would fail with the error `Provider does not support this property`. The `SQLGetInfo()` returned the wrong value for `SQL_DATABASE_NAME` when no database was selected. (Bug #3780)

Changes in MySQL Connector/ODBC 3.51.22 (2007-11-13)

Functionality Added or Changed

- The workaround for this bug was removed due to the fixes in MySQL Server 5.0.48 and 5.1.21.

  References: This bug was introduced by Bug #10491.

Bugs Fixed

- Unsigned integer values greater than the maximum value of a signed integer would be handled incorrectly. (Bug #32171)
- When accessing information about supported operations, the driver would return incorrect information about the support for `UNION`. (Bug #32253)
- The `English` locale would be used when formatting floating point values. The `C` locale is now used for these values. (Bug #32294)
- The wrong result was returned by `SQLGetData()` when the data was an empty string and a zero-sized buffer was specified. (Bug #30958)
- Added the `FLAG_COLUMN_SIZE_S32` option to limit the reported column size to a signed 32-bit integer. This option is automatically enabled for ADO applications to provide a work around for a bug in ADO. (Bug #13776)

Changes in MySQL Connector/ODBC 3.51.21 (2007-10-08)

Bugs Fixed

- Uninitiated memory could be used when C/ODBC internally calls `SQLGetFunctions()`. (Bug #31055)
- When using a rowset/cursor and add a new row with a number of fields, subsequent rows with fewer fields will include the original fields from the previous row in the final `INSERT` statement. (Bug #31246)
- Not specifying a user in the DSN dialog would raise a warning even though the parameter is optional. (Bug #30499)
- The wrong `SQL_DESC_LITERAL_PREFIX` would be returned for date/time types. (Bug #31009)

- The wrong `COLUMN_SIZE` would be returned by `SQLGetTypeInfo` for the TIME columns (`SQL_TYPE_TIME`). (Bug #30939)
- Clicking outside the character set selection box when configuring a new DSN could cause the wrong character set to be selected. (Bug #30568)
- `SQLSetParam()` caused memory allocation errors due to driver manager's mapping of deprecated functions (buffer length -1). (Bug #29871)
- When using ADO, a column marked as `AUTO_INCREMENT` could incorrectly report that the column permitted `NULL` values. This was dur to an issue with `NULLABLE` and `IS_NULLABLE` return values from the call to `SQLColumns()`. (Bug #26108)
- MySQL Connector/ODBC would return the wrong the error code when the server disconnects the active connection because the configured `wait_timeout` [538] has expired. Previously it would return `HY000`. MySQL Connector/ODBC now correctly returns an `SQLSTATE` of `08S01`. (Bug #3456)

Changes in MySQL Connector/ODBC 3.51.20 (2007-09-10)

Bugs Fixed

- The wrong column size was returned for binary data. (Bug #30547)
- The specified length of the user name and authentication parameters to `SQLConnect()` were not being honored. (Bug #30774)
- `SQLGetData()` will now always return `SQL_NO_DATA_FOUND` on second call when no data left, even if requested size is 0. (Bug #30520)
- Using `FLAG_NO_PROMPT` doesn't suppress the dialogs normally handled by `SQLDriverConnect`. (Bug #30840)
- `SQLGetConnectAttr()` did not reflect the connection state correctly. (Bug #14639)
- Removed check box in setup dialog for `FLAG_FIELD_LENGTH` (identified as `Don't Optimize Column Width` within the GUI dialog), which was removed from the driver in 3.51.18.

Changes in MySQL Connector/ODBC 3.51.19 (2007-08-10)

Connector/ODBC 3.51.19 fixes a specific issue with the 3.51.18 release. For a list of changes in the 3.51.18 release, see Changes in MySQL Connector/ODBC 3.51.18 (2007-08-08).

Functionality Added or Changed

- Because of Bug #10491 in the server, character string results were sometimes incorrectly identified as `SQL_VARBINARY`. Until this server bug is corrected, the driver will identify all variable-length strings as `SQL_VARCHAR`.

Changes in MySQL Connector/ODBC 3.51.18 (2007-08-08)

Platform-Specific Notes

- A binary package without an installer is available for Microsoft Windows x64 Edition. There are no installer packages for Microsoft Windows x64 Edition.
- Binary packages as disk images with installers are now available for Mac OS X.
- Binary packages for Sun Solaris are now available as `PKG` packages.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.

Functionality Added or Changed

- **Incompatible Change**: The `FLAG_DEBUG` option was removed.
- When connecting to a specific database when using a DSN, the system tables from the `mysql` database are no longer also available. Previously, tables from the mysql database (catalog) were listed as `SYSTEM TABLES` by `SQLTables()` even when a different catalog was being queried. (Bug #28662)
- Installed for Mac OS X has been re-instated. The installer registers the driver at a system (not user) level and makes it possible to create both user and system DSNs using the MySQL Connector/ODBC driver. The installer also fixes the situation where the necessary drivers would bge installed local to the user, not globally. (Bug #15326, Bug #10444)
- MySQL Connector/ODBC now supports batched statements. To enable cached statement support, you must switch enable the batched statement option (`FLAG_MULTI_STATEMENTS`, 67108864, or **Allow multiple statements** within a GUI configuration). Be aware that batched statements create an increased chance of SQL injection attacks and you must ensure that your application protects against this scenario. (Bug #7445)
- The `SQL_ATTR_ROW_BIND_OFFSET_PTR` is now supported for row bind offsets. (Bug #6741)
- The `TRACE` and `TRACEFILE` DSN options have been removed. Use the ODBC driver manager trace options instead.

Bugs Fixed

- Getting table metadata (through the `SQLColumns()` would fail, returning a bad table definition to calling applications. (Bug #29888)
- When using a table with multiple `TIMESTAMP` columns, the final `TIMESTAMP` column within the table definition would not be updatable. Note that there is still a limitation in MySQL server regarding multiple `TIMESTAMP` columns. (Bug #30081)

  References: See also Bug #9927.
- Fixed an issue where the `myodbc3i` would update the user ODBC configuration file (`~/Library/ODBC/odbcinst.ini`) instead of the system `/Library/ODBC/odbcinst.ini`. This was caused because `myodbc3i` was not honoring the `s` and `u` modifiers for the `-d` command-line option. (Bug #29964)
- `DATETIME` column types would return `FALSE` in place of `SQL_SUCCESS` when requesting the column type information. (Bug #28657)
- The `SQL_COLUMN_TYPE`, `SQL_COLUMN_DISPLAY` and `SQL_COLUMN_PRECISION` values would be returned incorrectly by `SQLColumns()`, `SQLDescribeCol()` and `SQLColAttribute()` when accessing character columns, especially those generated through `concat()`. The lengths returned should now conform to the ODBC specification. The `FLAG_FIELD_LENGTH` option no longer has any affect on the results returned. (Bug #27862)
- The `SQLColumns()` function could return incorrect information about `TIMESTAMP` columns, indicating that the field was not nullable. (Bug #14414)
- Obtaining the length of a column when using a character set for the connection of `utf8` would result in the length being returned incorrectly. (Bug #19345)
- The `SQLColumns()` function could return incorrect information about `AUTO_INCREMENT` columns, indicating that the field was not nullable. (Bug #14407)
- The `SQL_DATA_TYPE` column in `SQLColumns()` results did not report the correct value for date and time types.

- The wrong value for `DECIMAL_DIGITS` in `SQLColumns()` was reported for `FLOAT` and `DOUBLE` fields, as well as the wrong value for the scale parameter to `SQLDescribeCol()`, and the `SQL_DESC_SCALE` attribute from `SQLColAttribute()`.
- Binary packages for Sun Solaris are now available as `PKG` packages.
- Binary packages as disk images with installers are now available for Mac OS X.
- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- `SQLConnect()` and `SQLDriverConnect()` were rewritten to eliminate duplicate code and ensure all options were supported using both connection methods. `SQLDriverConnect()` now only requires the setup library to be present when the call requires it.
- The wrong value for `SQL_DESC_TYPE` was returned for date and time types.
- The value for `SQL_DESC_FIXED_PREC_SCALE` was not returned correctly for values in MySQL 5.0 and later.
- The `SQL_DATETIME_SUB` column in SQLColumns() was not correctly set for date and time types.
- The wrong value from `SQL_DESC_LITERAL_SUFFIX` was returned for binary fields.
- `BIT(n)` columns are now treated as `SQL_BIT` data where `n = 1` and binary data where `n > 1`.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- A binary package without an installer is available for Microsoft Windows x64 Edition. There are no installer packages for Microsoft Windows x64 Edition.

Changes in MySQL Connector/ODBC 3.51.17 (2007-07-14)

Platform-Specific Notes

- A binary package without an installer is available for Microsoft Windows x64 Edition. There are no installer packages for Microsoft Windows x64 Edition.
- Binary packages as disk images with installers are now available for Mac OS X.
- Binary packages for Sun Solaris are now available as `PKG` packages.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.

Functionality Added or Changed

- It is now possible to specify a different character set as part of the DSN or connection string. This must be used instead of the `SET NAMES` statement. You can also configure the character set value from the GUI configuration. (Bug #9498, Bug #6667)
- The setup library has been split into its own RPM package, to enable installing the driver itself with no GUI dependencies.
- Dis-allow NULL ptr for null indicator when calling SQLGetData() if value is null. Now returns SQL_ERROR w/state 22002.
- Fixed calling convention ptr and wrong free in `myodbc3i`, and fixed the null terminating (was only one, not two) when writing DSN to string.

Bugs Fixed

- `myodbc3i` did not correctly format driver info, which could cause the installation to fail. (Bug #29709)
- Fixed a problem where the GUI would crash when configuring or removing a System or User DSN. (Bug #27315)
- Fixed error handling of out-of-memory and bad connections in catalog functions. This might raise errors in code paths that had ignored them in the past. (Bug #26934)
- MySQL Connector/ODBC crashed with Crystal Reports due to a problem with `SQLProcedures()`. (Bug #28316)
- For a stored procedure that returns multiple result sets, MySQL Connector/ODBC returned only the first result set. (Bug #16817)
- Added a new DSN option (`FLAG_ZERO_DATE_TO_MIN`) to retrieve `XXXX-00-00` dates as the minimum permitted ODBC date (`XXXX-01-01`). Added another option (`FLAG_MIN_DATE_TO_ZERO`) to mirror this but for bound parameters. `FLAG_MIN_DATE_TO_ZERO` only changes `0000-01-01` to `0000-00-00`. (Bug #13766)
- Calling `SQLGetDiagField` with `RecNumber 0, DiagIdentifier NOT 0` returned `SQL_ERROR`, preventing access to diagnostic header fields. (Bug #16224)
- The driver was using `mysql_odbc_escape_string()`, which does not handle the `NO_BACKSLASH_ESCAPES` [573] SQL mode. Now it uses `mysql_real_escape_string()`, which does. (Bug #9498)
- `SQLColumns()` did not handle many of its parameters correctly, which could lead to incorrect results. The table name argument was not handled as a pattern value, and most arguments were not escaped correctly when they contained nonalphanumeric characters. (Bug #8860)
- When inserting a large `BLOB` field, MySQL Connector/ODBC would crash due to a memory allocation error. (Bug #10562)
- If there was more than one unique key on a table, the correct fields were not used in handling `SQLSetPos()`. (Bug #10563)
- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- The binary packages for Sun Solaris are only provided as tarballs, not the PKG format.
- The Mac OS X binary packages are only provided as tarballs, there is no installer.
- Fixed possible crash if `SQLBindCol()` was not called before `SQLSetPos()`.
- Correctly return error if `SQLBindCol` is called with an invalid column.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- There are no binary packages for Microsoft Windows x64 Edition.

Changes in MySQL Connector/ODBC 3.51.16 (2007-06-14)

Functionality Added or Changed

- MySQL Connector/ODBC now supports using SSL for communication. This is not yet exposed in the setup GUI, but must be enabled through configuration files or the DSN. (Bug #12918)

Bugs Fixed

- Calls to SQLNativeSql() could cause stack corruption due to an incorrect pointer cast. (Bug #28758)

- `SQLForeignKeys` does not escape `_` and `%` in the table name arguments. (Bug #27723)
- When using stored procedures, making a `SELECT` or second stored procedure call after an initial stored procedure call, the second statement will fail. (Bug #27544)
- Using cursors on results sets with multi-column keys could select the wrong value. (Bug #28255)
- Return values from `SQLTables()` may be truncated. (Bug #22797)
- SQLTables() did not distinguish tables from views. (Bug #23031)
- Data in `TEXT` columns would fail to be read correctly. (Bug #16917)
- Using `BETWEEN` with date values, the wrong results could be returned. (Bug #15773)
- Specifying strings as parameters using the `adBSTR` or `adVarWChar` types, (`SQL_WVARCHAR` and `SQL_WLONGVARCHAR`) would be incorrectly quoted. (Bug #16235)
- SQL_WVARCHAR and SQL_WLONGVARCHAR parameters were not properly quoted and escaped. (Bug #16235)
- When using the `Don't Cache Results` (option value `1048576`) with Microsoft Access, the connection will fail using DAO/VisualBasic. (Bug #4657)

Changes in MySQL Connector/ODBC 3.51.15 (2007-05-07)

Bugs Fixed

- When inserting data using bulk statements (through `SQLBulkOperations`), the indicators for all rows within the insert would not updated correctly. (Bug #24306)
- An incorrect transaction isolation level may not be returned when accessing the connection attributes. (Bug #27589)
- The `SQLTransact()` function did not support an empty connection handle. (Bug #21588)
- Adding a new DSN with the `myodbc3i` utility under AIX would fail. (Bug #27220)
- Using `SQLProcedures` does not return the database name within the returned resultset. (Bug #23033)
- MySQL Connector/ODBC would incorrectly claim to support `SQLProcedureColumns` (by returning true when queried about `SQLPROCEDURECOLUMNS` with `SQLGetFunctions`), but this functionality is not supported. (Bug #27591)
- Using `SQLDriverConnect` instead of `SQLConnect` could cause later operations to fail. (Bug #7912)
- When using blobs and parameter replacement in a statement with `WHERE CURSOR OF`, the SQL is truncated. (Bug #5853)
- MySQL Connector/ODBC would return too many foreign key results when accessing tables with similar names. (Bug #4518)

Changes in MySQL Connector/ODBC 3.51.14 (2007-03-08)

Functionality Added or Changed

- Use of `SQL_ATTR_CONNECTION_TIMEOUT` on the server has now been disabled. If you attempt to set this attribute on your connection the `SQL_SUCCESS_WITH_INFO` will be returned, with an error number/string of `HYC00: Optional feature not supported`. (Bug #19823)
- Added auto is null option to MySQL Connector/ODBC option parameters. (Bug #10910)

- Added support for the `HENV` handlers in `SQLEndTran()`.
- Added auto-reconnect option to MySQL Connector/ODBC option parameters.

Bugs Fixed

- When retrieving `TIME` columns, C/ODBC would incorrectly interpret the type of the string and could interpret it as a `DATE` type instead. (Bug #25846)
- On 64-bit systems, some types would be incorrectly returned. (Bug #26024)
- MySQL Connector/ODBC may insert the wrong parameter values when using prepared statements under 64-bit Linux. (Bug #22446)
- Using MySQL Connector/ODBC, with `SQLBindCol` and binding the length to the return value from `SQL_LEN_DATA_AT_EXEC` fails with a memory allocation error. (Bug #20547)
- The `SQLDriverConnect()` ODBC method did not work with recent MySQL Connector/ODBC releases. (Bug #12393)
- The ODBC driver name and version number were incorrectly reported by the driver. (Bug #19740)
- Using `DataAdapter`, MySQL Connector/ODBC may continually consume memory when reading the same records within a loop (Windows Server 2003 SP1/SP2 only). (Bug #20459)
- When retrieving data from columns that have been compressed using `COMPRESS()`, the retrieved data would be truncated to 8KB. (Bug #20208)
- A string format exception would be raised when using iODBC, MySQL Connector/ODBC and the embedded MySQL server. (Bug #16535)

Changes in MySQL Connector/ODBC 3.51.13 (Never released)

Connector/ODBC 3.51.13 was an internal implementation and testing release.

Version 3.51.13 has no changelog entries.

Changes in MySQL Connector/ODBC 3.51.12 (2005-02-11)

Functionality Added or Changed

- N/A

Bugs Fixed

- Using stored procedures with ADO, where the `CommandType` has been set correctly to `adCmdStoredProc`, calls to stored procedures would fail. (Bug #15635)
- `SQLColumns()` returned no information for tables that had a column named using a reserved word. (Bug #9539)
- File DSNs could not be saved. (Bug #12019)

Changes in MySQL Connector/ODBC 3.51.11 (2005-01-28)

Bugs Fixed

- `mysql_list_dbcolumns()` and `insert_fields()` were retrieving all rows from a table. Fixed the queries generated by these functions to return no rows. (Bug #8198)
- `SQLGetTypoInfo()` returned `tinyblob` for `SQL_VARBINARY` and nothing for `SQL_BINARY`. Fixed to return `varbinary` for `SQL_VARBINARY`, `binary` for `SQL_BINARY`, and `longblob` for `SQL_LONGVARBINARY`. (Bug #8138)

MySQL Connector/Net Change History

Changes in MySQL Connector/Net Version 6.6.x

Changes in MySQL Connector/Net 6.6.3 (2012-09-28, beta)

Changes in MySQL Connector/Net 6.6.2 (August 2012, beta)

Continued improvements and fixes to the 6.6 feature set.

Stored Procedure Debugging

- This beta release removes several of the earlier limitations on stored procedure debugging:
  - Functions and triggers can now be debugged.
  - Intellisense is enabled in the debugger window.
  - The debugger supports the SQL grammar for all MySQL versions from 5.0 to 5.6.
  - When a debugging session is finished, stored routines that were instrumented are now restored to their original form.
  - You can now evaluate and change session variables, in addition to local variables in the procedure.
  - Conditional breakpoints are supported now.
  - When debugging a routine that has parameters, the debugger prompts for values to use for the parameters. These prompted values no longer overwrite session variables that have the same names.
  - You do not need to check the **Save password** checkbox when creating a new connection in Server Explorer.

  These limitations remain:

  - Some MySQL functions cannot be debugged currently (`get_lock`, `release_lock`, `begin`, `commit`, `rollback`, `set transaction` level).
  - Only one debug session may be active on a given server.

Changes in MySQL Connector/Net 6.6.1 (2012-08-08, alpha)

Continued improvements and fixes to the 6.6 feature set.

Version 6.6.1 has no changelog entries.

Changes in MySQL Connector/Net 6.6.0 (2012-07-17, alpha)

First alpha release for Connector/NET 6.6. Major features of Connector/Net 6.6:

- Stored procedure debugging in Microsoft Visual Studio.
- Entity Framework 4.3 Code First support.
- Pluggable authentication (not available in this alpha).

Entity Framework Code First Support

- To support the Entity Framework 4.3.1, Connector/Net can now use the Code First approach when developing against a model, and keep track of the changes in the Entity Model and in the Database.

This new Entity Framework 4.3.1 feature is focused in allowing your database to be updated along with your Code First Model changes.

Stored Procedure Debugging

- The Connector/Net integration with Visual Studio now includes stored procedure debugging. It works in a very intuitive manner, by simply clicking **Debug Routine** from Server Explorer. The limitations in this preliminary alpha release include:
  - Can only debug stored procedures. Functions and triggers cannot be debugged yet.
  - Intellisense is currently not enabled in the debugger window.
  - Some MySQL functions cannot be debugged currently (`get_lock`, `release_lock`, `begin`, `commit`, `rollback`, `set transaction` level).
  - Only 5.1 grammar is currently supported.
  - Only one debug session may be active on a given server.
  - The debugger instruments your procedures automatically. The original procedure might not be not restored correctly.
  - Evaluating and changing session variables are not supported. Local variables in the procedure are supported.
  - Conditional breakpoints are not supported.
  - When debugging a routine that has parameters, the debugger will prompt for those values. It will create session variables out of them, so be careful to not use your own session variables that have the same name.
  - When creating a new connection in Server Explorer, please check the **Save password** checkbox.

Bugs Fixed

- When using Entity Framework with Connector/Net, the association property `OnDelete` was not taken into account in the `CreateDatabaseScript` function of the `ObjectContext`, leading to an error message `System.Data.UpdateException was unhandled`. The SQL generated by the `CreateDatabaseScript` function was missing `ON DELETE` and `ON UPDATE` clauses. These clauses were filled in correctly by the DDL generation wizard. (Bug #14008752, Bug #64779)
- A call to a stored procedure or function in an application using the Code First entity framework could result in an error:

```
Unhandled Exception: MySql.Data.MySqlClient.MySqlException: You have an error
in your SQL syntax; ...
```

  The code change allows syntax such as the following to invoke a stored procedure, without using the `CALL` statement and without using `CommandType.StoredProcedure`.

```
int count = myContext.Database.SqlQuery<int>("GetCount").First();
```

  (Bug #14008699, Bug #64999)
- When using the Entity Framework Code First approach, the generated code could be incorrect:
  - Missing length specifier for data types, such as `VARBINARY` instead of `VARBINARY(n)`.
  - `ALTER TABLE` statements referring to nonexistent tables, when private members were specified inside the main class.

  (Bug #13900091, Bug #64216)

Changes in MySQL Connector/Net Version 6.5.x

Changes in MySQL Connector/Net 6.5.5 (Not yet released.)

Version 6.5.5 has no changelog entries.

Changes in MySQL Connector/Net 6.5.4 (2012-03-08)

First GA release for Connector/NET 6.5.

Bugs Fixed

- In Visual Studio Table Designer, if you tried to save a new table using an existing table name, subsequently you would not be prompted to choose a new name, preventing you from saving the table. (Bug #13785918)
- When creating a Visual Studio Web Application Project, using the ADO.NET Entity Data Model and generating the model from a database, the Entity Framework Model was not created. This operation gave an error:

  ```
  Access denied for user 'root'@'localhost' (using password: NO)
  ```

  (Bug #13610452)
- When creating a project in VisualStudio using a .NET framework such as 3.0 or 3.5 (anything less than 4.0), the Connector/Net library (`MySql.Data.dll`) was not listed in the **Add References** dialog box. The workaround was to browse to the library and add it manually. (Bug #13491678, Bug #60462)

Changes in MySQL Connector/Net 6.5.3 (2012-02-27)

Second Release Candidate (RC) release.

Bugs Fixed

- The performance when setting the `CommandText` property on the `MySqlCommand` class was improved by enhancing the efficiency of a string comparison operation. (Bug #13739383, Bug #64012)
- Fixed `MySqlTime` parsing to avoid throwing an exception when handling milliseconds (as result of a `timediff` operation). (Bug #13708884, Bug #64268)
- In Visual Studio Table Designer, when adding a second foreign key, the new name was incorrectly assigned to the first foreign key in the list. (Bug #13613824)
- In Visual Studio Table Designer, changes to a field were sometimes not detected until you switched focus away from that field. (Bug #13613755)

Changes in MySQL Connector/Net 6.5.2 (2012-02-15)

First Release Candidate (RC) release.

Bugs Fixed

- When using connection pooling, the connections in the pool were not automatically closed upon application exit. With the setting `log-warnings=2`, you could encounter `Aborted connection` errors in the MySQL error log. The workaround was to explicitly call `MySql.Data.MySqlClient.MySqlConnection.ClearAllPools();` upon exiting the application. (Bug #13629471, Bug #63942)
- If `MySqlCommand.CommandText` was equal to `null`, then `MySqlCommand.ExecuteReader()` would throw the wrong exception: `NullReferenceException` instead of `InvalidOperationException`. (Bug #13624659, Bug #64092)

- In Visual Studio Table Designer, when editing a foreign key relationship, choosing a column name on the left side made that column name unavailable on the right side. (Bug #13615258)
- In Visual Studio Table Designer, modifying the **Columns** field in the **Indexes/Keys** dialog multiple times could cause an error. (Bug #13613765)
- In Visual Studio Table Designer, it was possible to save a new foreign key relationship without filling in the fields of the **Foreign Key Relationship** dialog. (Bug #13613839)
- In Visual Studio Table Designer, changing the length of a `VARCHAR` field could cause an error. (Bug #13611677)
- In Visual Studio Table Designer, an error could occur if you added and deleted column information for foreign keys in a particular sequence. (Bug #13610235)
- In Visual Studio Table Designer, deleting a foreign key relationship in the **Relationship** dialog required clicking twice. (Bug #13610283)
- The MySQL script generated by using the function `CreateDatabaseScript` used names with incorrect singular/plural forms. (Bug #13582837, Bug #62150)
- In Visual Studio Table Designer, the **Add -> Function Import...** dialog could close prematurely when you pressed the **Get Column Information** button. (Bug #13511736)
- When designating a primary key for a table in Table Designer, the key icon could fail to appear until the Table Designer was restarted. (Bug #13481246)

Changes in MySQL Connector/Net 6.5.1 (2012-01-23)

Second beta release.

Bugs Fixed

- IntelliSense would emit an error when the "`-`" (minus) character was typed. (Bug #13522344)
- After an `UPDATE` statement, Connector/Net would generate incorrect `SELECT` SQL statements if a value in the `WHERE` clause was not also present in the `SET` clause of the `UPDATE`. (Bug #13491689, Bug #62134)
- In Table Designer for Visual Studio, trying to delete foreign keys from an `InnoDB` table showed an error, and the change was not saved. (Bug #13481362)

Changes in MySQL Connector/Net 6.5.0 (2011-12-22)

First beta release.

Functionality Added or Changed

- Added better IntelliSense support, including auto-completion when editing stored procedures or `.mysql` files. For more information, see Using IntelliSense in the SQL Editor.
- Adds a `MySqlClientPermission` class to help users define the security policies for the database connections within any application using a MySQL database.
- Added better partial-trust support, thus allowing Connector/NET to run in a partial trust scenario. It will work correctly in a medium-trust level environment when the library is installed in the GAC. For more information, see Working with Partial Trust.
- Added fractional seconds support, as per MySQL Server 5.6 and above. For more information, see Fractional Seconds in Time Values
- Added “interceptor” classes for exceptions and commands. For more information, see Using the Connector/Net Interceptor Classes.

Bugs Fixed

- The `MySqlDataReader.GetDateTime()` method was not recognizing that `TIMESTAMP` values had already been converted to the local time zone of the MySQL server, which could cause incorrect results if the value was later processed through the `ToLocalTime()` method. The fix causes the `Kind` property to be correctly set to `Local` rather than `Unspecified`. (Bug #13591554, Bug #63812)

- Visual Studio 2010 Table Designer could give an error “Object reference not set to an instance of an object” for schemas with certain combinations of column names and foreign key references. The SQL syntax was incorrect for the `ALTER TABLE` statement generated by the Table Designer. (Bug #13591545, Bug #63714)

Changes in MySQL Connector/Net Version 6.4.x

Changes in MySQL Connector/Net 6.4.5 (2012-05-19)

This release fixes bugs since 6.4.4.

Bugs Fixed

- When the length of a `VARCHAR` column was edited in Table Designer, the data type could be saved incorrectly as `BIT`. (Bug #13916560)

- Any sequence of `Take(n)` method calls followed by `Count` or `LongCount` would cause a `System.Data.EntityCommandCompilationException` error. (Bug #13913047, Bug #64749)

- In Visual Studio Table Designer, if you tried to save a new table using an existing table name, subsequently you would not be prompted to choose a new name, preventing you from saving the table. (Bug #13785918)

- The performance when setting the `CommandText` property on the `MySqlCommand` class was improved by enhancing the efficiency of a string comparison operation. (Bug #13739383, Bug #64012)

- Visual Studio 2010 Table Designer could give an error “Object reference not set to an instance of an object” for schemas with certain combinations of column names and foreign key references. The SQL syntax was incorrect for the `ALTER TABLE` statement generated by the Table Designer. (Bug #13591545, Bug #63714)

- The MySQL script generated by using the function `CreateDatabaseScript` used names with incorrect singular/plural forms. (Bug #13582837, Bug #62150)

- In “LINQ to Entity” queries, including a child entity (1-n) and its entities (n-n) returned the wrong results. For example:

  ```
  db.Authors.Include("Books.Editions").AsEnumerable().First();
  ```

  (Bug #13491698, Bug #62801)

- When creating a project in VisualStudio using a .NET framework such as 3.0 or 3.5 (anything less than 4.0), the Connector/Net library (`MySql.Data.dll`) was not listed in the **Add References** dialog box. The workaround was to browse to the library and add it manually. (Bug #13491678, Bug #60462)

- After an `UPDATE` statement, Connector/Net would generate incorrect `SELECT` SQL statements if a value in the `WHERE` clause was not also present in the `SET` clause of the `UPDATE`. (Bug #13491689, Bug #62134)

- In Table Designer for Visual Studio, trying to delete foreign keys from an `InnoDB` table showed an error, and the change was not saved. (Bug #13481362)

- In Table Designer for Visual Studio, trying to create a table could fail if you saved changes immediately after entering the data type for a column. The workaround was to click somewhere else in the grid before saving changes. (Bug #13477805)
- Creating a table through the Server Explorer Window on Visual Studio 2010 could fail with a MySQL syntax error. The properties in the `CREATE TABLE` statement could be listed in incorrect order. (Bug #13475830)
- Formerly, cleanup operations for expired sessions were fully automatic, with no ability to catch the timeout event and do application-specific cleanup. This fix adds a `enableSessionExpireCallback` connection option to let developers catch the event when a session expires. When `enableSessionExpireCallback` is enabled, the `global.asax.session_end` event is raised before data is deleted from the `my_aspnet_sessions` table. When `enableSessionExpireCallback` is disabled, the data is deleted from the `my_aspnet_sessions` table without raising the event first. The timeout period for session expiry is specified in the `web.config` file, in the `timeout` option of the `sessionState` section. (Bug #13354935, Bug #62266)
- Connector/NET experienced poor performance when adding parameters to the `MySQLCommand`. (Bug #62653, Bug #13331475)
- The Unicode quotation mark character `U+0022` was not escaped by the `MySQLHelper` class. (Bug #62585, Bug #13092886)
- Using a return parameter without a name resulted in an `IndexOutOfRangeException` exception. (Bug #62416, Bug #13006969)
- The `Mono` runtime did not support hashed passwords. (Bug #62203, Bug #13041618)
- Connector/NET incorrectly maps `PrimitiveTypeKind.Byte` to `tinyint`, instead of `utinyint`. And `PrimitiveTypeKind.SByte` mapping was added, to `tinyint`. (Bug #62135, Bug #13061713)
- Connector/NET would incorrectly map decimal values to ANSI strings. (Bug #62246, Bug #13050570)

Changes in MySQL Connector/Net 6.4.4 (2011-09-26)

This release fixes bugs since 6.4.3.

Functionality Added or Changed

- Connector/Net now enables clients to connect to the server through accounts that use Windows native authentication. For more information, see Using the Windows Native Authentication Plugin and The Windows Native Authentication Plugin.

Bugs Fixed

- (Bug #12897149)
- When creating a tableadapter through a Dataset form in Visual Studio, the `MaxLength` of the field for a `CHAR` column could be set to 3 times the length of the table column. Although this many bytes could be needed to hold a UTF-8 character value, the length value was not appropriate for restricting the length of a `TextBox`. (Bug #12860224, Bug #62094)
- An error `out of sync with server` could occur when connecting in the Visual Studio Entity Framework. The issue occurred only on some MySQL servers, all with versions earlier than MySQL 5.5. (Bug #12853286, Bug #61806)
- When adding a `MEDIUMTEXT` or `LONGTEXT` column Visual Studio, the facet `Fixed length` had to be set to `false`, even though these types allow arbitrary lengths. (Bug #12848277, Bug #54915)

- Using a combination of `ListView`, `EntityDataSource` with `TypeFilter` and `Include EntityCollection Navigation Property`, and `DataPager` caused a `NullReferenceException` error in the `System.Web.UI.WebControls.EntityDataSourceView.ExecuteSelect` function. (Bug #12776517, Bug #61714)
- Executing a “LINQ to Entity” query could result in a `NullReferenceException` error. (Bug #12776598, Bug #61729)
- `MySqlScript` was modified to enable correct processing of the `DELIMITER` command when not followed by a new line. (Bug #61680, Bug #12732279)
- `MySqlDataReader.Close` was modified to use Default behavior when clearing remaining result sets. (Bug #61690, Bug #12723423)
- On Model First changed column types generated in SQL scripts to produce more suitable `MySql` types. (Bug #59244, Bug #12707104)
- The ASP.NET membership provider was modified to create and query all related tables using lowercase names. (Bug #61108, Bug #12702009)

Changes in MySQL Connector/Net 6.4.3 (2011-07-03)

This release fixes bugs since 6.4.2.

Bugs Fixed

- `SchemaDefinition-5.5.ssdl` was modified to treat `CHAR(36)` columns as a GUID. (Bug #61657, Bug #12708208)
- `SqlFragment.QuoteIdentifier` was modified to add MySQL quotes around identifiers. (Bug #61635, Bug #12707285)

Changes in MySQL Connector/Net 6.4.2 (2011-06-29)

This release fixes bugs since 6.4.1.

Bugs Fixed

- Modified `MySqlConnection.BeginTransaction` to throw a `NotSupportedException` for `Snapshot` isolation level. (Bug #61589, Bug #12698020)
- Modified `ProviderManifest.xml` to map `TIMESTAMP` database columns to the `DateTime` .NET type. (Bug #55351, Bug #12652602)
- Fixed Entity Framework provider `GROUP BY` clause generation by adding all group-by keys to the `SELECT` statement. (Bug #46742, Bug #12622129)

Changes in MySQL Connector/Net 6.4.1 (2011-06-06, Alpha)

First alpha release.

Functionality Added or Changed

- Calling a stored procedure with output parameters caused a marked performance decrease. (Bug #60366, Bug #12425959)
- Changed how the procedure schema collection is retrieved. If the connection string contains “`use procedure bodies=true`” then a `SELECT` is performed on the `mysql.proc` table directly, as this is up to 50 times faster than the current Information Schema implementation. If the connection string contains “`use procedure bodies=false`”, then the Information Schema collection is queried. (Bug #36694)

Changes in MySQL Connector/Net 6.4.0 (Unknown)

Version 6.4.0 has no changelog entries.

Changes in MySQL Connector/Net Version 6.3.x

Changes in MySQL Connector/Net 6.3.9 (2012-04-11)

This release fixes bugs since 6.3.8.

Bugs Fixed

- When the length of a `VARCHAR` column was edited in Table Designer, the data type could be saved incorrectly as `BIT`. (Bug #13916560)
- Any sequence of `Take(n)` method calls followed by `Count` or `LongCount` would cause a `System.Data.EntityCommandCompilationException` error. (Bug #13913047, Bug #64749)
- When adding a ADO.NET Entity Data Model and generating the model from a database containing foreign keys, the foreign keys were not included in the generated model. (Bug #13800109)
- The performance when setting the `CommandText` property on the `MySqlCommand` class was improved by enhancing the efficiency of a string comparison operation. (Bug #13739383, Bug #64012)
- Fixed `MySqlTime` parsing to avoid throwing an exception when handling milliseconds (as result of a `timediff` operation). (Bug #13708884, Bug #64268)
- When using connection pooling, the connections in the pool were not automatically closed upon application exit. With the setting `log-warnings=2`, you could encounter `Aborted connection` errors in the MySQL error log. The workaround was to explicitly call `MySql.Data.MySqlClient.MySqlConnection.ClearAllPools();` upon exiting the application. (Bug #13629471, Bug #63942)
- If `MySqlCommand.CommandText` was equal to `null`, then `MySqlCommand.ExecuteReader()` would throw the wrong exception: `NullReferenceException` instead of `InvalidOperationException`. (Bug #13624659, Bug #64092)
- In Visual Studio Table Designer, when adding a second foreign key, the new name was incorrectly assigned to the first foreign key in the list. (Bug #13613824)
- In Visual Studio Table Designer, when editing a foreign key relationship, choosing a column name on the left side made that column name unavailable on the right side. (Bug #13615258)
- In Visual Studio Table Designer, modifying the **Columns** field in the **Indexes/Keys** dialog multiple times could cause an error. (Bug #13613765)
- In Visual Studio Table Designer, it was possible to save a new foreign key relationship without filling in the fields of the **Foreign Key Relationship** dialog. (Bug #13613839)
- In Visual Studio Table Designer, changes to a field were sometimes not detected until you switched focus away from that field. (Bug #13613755)
- In Visual Studio Table Designer, changing the length of a `VARCHAR` field could cause an error. (Bug #13611677)
- In Visual Studio Table Designer, an error could occur if you added and deleted column information for foreign keys in a particular sequence. (Bug #13610235)
- In Visual Studio Table Designer, deleting a foreign key relationship in the **Relationship** dialog required clicking twice. (Bug #13610283)

- When creating a Visual Studio Web Application Project, using the ADO.NET Entity Data Model and generating the model from a database, the Entity Framework Model was not created. This operation gave an error:

  ```
  Access denied for user 'root'@'localhost' (using password: NO)
  ```

  (Bug #13610452)

- The MySQL script generated by using the function `CreateDatabaseScript` used names with incorrect singular/plural forms. (Bug #13582837, Bug #62150)

- IntelliSense would emit an error when the "`-`" (minus) character was typed. (Bug #13522344)

- In Visual Studio Table Designer, the **Add -> Function Import...** dialog could close prematurely when you pressed the **Get Column Information** button. (Bug #13511736)

- In Visual Studio's Server Explorer, right-clicking on a table in the Tables tree and selecting Create Trigger could cause an error, `Object reference not set to an instance of an object`. (Bug #13511801)

- In “LINQ to Entity” queries, including a child entity (1-n) and its entities (n-n) returned the wrong results. For example:

  ```
  db.Authors.Include("Books.Editions").AsEnumerable().First();
  ```

  (Bug #13491698, Bug #62801)

- After an `UPDATE` statement, Connector/Net would generate incorrect `SELECT` SQL statements if a value in the `WHERE` clause was not also present in the `SET` clause of the `UPDATE`. (Bug #13491689, Bug #62134)

- The class `MySql.Data.Types.MySqlDateTime` was not serializable. (Bug #11750161, Bug #40555)

- Connector/NET incorrectly maps `PrimitiveTypeKind.Byte` to `tinyint`, instead of `utinyint`. And `PrimitiveTypeKind.SByte` mapping was added, to `tinyint`. (Bug #62135, Bug #13061713)

- Connector/NET would incorrectly map decimal values to ANSI strings. (Bug #62246, Bug #13050570)

- On Model First changed column types generated in SQL scripts to produce more suitable `MySql` types. (Bug #59244, Bug #12707104)

Changes in MySQL Connector/Net 6.3.8 (2011-12-16)

This release fixes bugs since 6.3.7.

Bugs Fixed

- In Visual Studio Table Designer, if you tried to save a new table using an existing table name, subsequently you would not be prompted to choose a new name, preventing you from saving the table. (Bug #13785918)

- Visual Studio 2010 Table Designer could give an error “Object reference not set to an instance of an object” for schemas with certain combinations of column names and foreign key references. The SQL syntax was incorrect for the `ALTER TABLE` statement generated by the Table Designer. (Bug #13591545, Bug #63714)

- When creating a project in VisualStudio using a .NET framework such as 3.0 or 3.5 (anything less than 4.0), the Connector/Net library (`MySql.Data.dll`) was not listed in the **Add References** dialog box. The workaround was to browse to the library and add it manually. (Bug #13491678, Bug #60462)

- In table designer for Visual Studio, you could not create a foreign key that referenced the same table as source and destination. When adding a new relationship, the **Referenced table** list did not offer the original table as one of the choices. (Bug #13481340)
- In Table Designer for Visual Studio, trying to delete foreign keys from an `InnoDB` table showed an error, and the change was not saved. (Bug #13481362)
- When a new column was added in Table Designer without selecting an associated data type, an error would occur trying to save the column definition. (Bug #13481298)
- When creating a foreign key relationship in Table Designer, changes to the `ON UPDATE` and `ON CASCADE` settings were not reflected in the actual table definition, as displayed by `SHOW CREATE TABLE`. (Bug #13481348)
- Removing a method was not affecting the indexes list of the table object, as defined within the Table Designer. (Bug #13481313)
- The columns added in descending sort order were not included in the index, as defined within the Server Explorer. (Bug #13481709)
- The comment property and index type were not added in the definition of the index, as defined within the Server Explorer. (Bug #13481314)
- Creating a table through the Server Explorer Window on Visual Studio 2010 could fail with a MySQL syntax error. The properties in the `CREATE TABLE` statement could be listed in incorrect order. (Bug #13475830)
- The Connector/Net installed for all users, and thus was not available in the `Add/Remove Programs` dialog for users other than the one who installed it. (Bug #13447941)
- The default value for `VARCHAR` and `CHAR` field types would contain single quotation marks. (Bug #13442506)
- When creating a tableadapter through a Dataset form in Visual Studio, the `MaxLength` of the field for a `CHAR` column could be set to 3 times the length of the table column. Although this many bytes could be needed to hold a UTF-8 character value, the length value was not appropriate for restricting the length of a `TextBox`. (Bug #12860224, Bug #62094)
- When adding a `MEDIUMTEXT` or `LONGTEXT` column Visual Studio, the facet `Fixed length` had to be set to `false`, even though these types allow arbitrary lengths. (Bug #12848277, Bug #54915)
- Using a combination of `ListView`, `EntityDataSource` with `TypeFilter` and `Include EntityCollection Navigation Property`, and `DataPager` caused a `NullReferenceException` error in the `System.Web.UI.WebControls.EntityDataSourceView.ExecuteSelect` function. (Bug #12776517, Bug #61714)
- Executing a “LINQ to Entity” query could result in a `NullReferenceException` error. (Bug #12776598, Bug #61729)
- Connector/NET experienced poor performance when adding parameters to the `MySQLCommand`. (Bug #62653, Bug #13331475)
- The Unicode quotation mark character `U+0022` was not escaped by the `MySQLHelper` class. (Bug #62585, Bug #13092886)
- Using a return parameter without a name resulted in an `IndexOutOfRangeException` exception. (Bug #62416, Bug #13006969)
- The `Mono` runtime did not support hashed passwords. (Bug #62203, Bug #13041618)
- Modified `MySqlConnection.BeginTransaction` to throw a `NotSupportedException` for `Snapshot` isolation level. (Bug #61589, Bug #12698020)

- `SchemaDefinition-5.5.ssdl` was modified to treat `CHAR(36)` columns as a GUID. (Bug #61657, Bug #12708208)
- `SqlFragment.QuoteIdentifier` was modified to add MySQL quotes around identifiers. (Bug #61635, Bug #12707285)
- `MySqlScript` was modified to enable correct processing of the `DELIMITER` command when not followed by a new line. (Bug #61680, Bug #12732279)
- `MySqlDataReader.Close` was modified to use Default behavior when clearing remaining result sets. (Bug #61690, Bug #12723423)
- Modified `ProviderManifest.xml` to map `TIMESTAMP` database columns to the `DateTime` .NET type. (Bug #55351, Bug #12652602)
- The ASP.NET membership provider was modified to create and query all related tables using lowercase names. (Bug #61108, Bug #12702009)

Changes in MySQL Connector/Net 6.3.7 (2011-06-22)

This release fixes bugs since 6.3.6.

Functionality Added or Changed

- Calling a stored procedure with output parameters caused a marked performance decrease. (Bug #60366, Bug #12425959)

Bugs Fixed

- `MySQLConnectionStringBuilder.ContainsKey()` incorrectly returned `false` when testing whether a keyword was part of the connection string. (Bug #11766671, Bug #59835)
- A `NullReferenceException` was thrown on disposal of a `TransactionScope` object. (Bug #59346, Bug #11766272)
- MySQL Connector/Net generated an exception when executing a query consisting of ';', for example:

```
mycmd(";",mycon)
mycmd.executenonquery()
```

  The exception generated was:

```
System.IndexOutOfRangeException: Index was outside the bounds of the array.
   at MySql.Data.MySqlClient.MySqlCommand.TrimSemicolons(String sql)
   at MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior)
   at MySql.Data.MySqlClient.MySqlCommand.ExecuteReader()
   at MySql.Data.MySqlClient.MySqlCommand.ExecuteNonQuery()
```

  (Bug #59537, Bug #11766433)

- MySQL Connector/Net 6.3.6 did not work with Visual Studio 2010. (Bug #60723, Bug #12394470)
- `MysqlDataReader.GetSchemaTable` returned incorrect values and types. (Bug #59989, Bug #11776346)
- Setting `Membership.ApplicationName` had no effect. (Bug #59438, Bug #11770465)
- All queries other than `INSERT` were executed individually instead of as a batch even though batching was enabled for the connection. (Bug #59616, Bug #11850286)
- The setup wizard failed with the error “Setup Wizard ended prematurely because of an error”. This was because it assumed .NET Framework version 4.0 was located on the C: drive, when it was actually located on the E: drive. (Bug #59301)

- Fixed Entity Framework provider `GROUP BY` clause generation by adding all group-by keys to the `SELECT` statement. (Bug #46742, Bug #12622129)

Changes in MySQL Connector/Net 6.3.6 (2011-01-03)

This release fixes bugs since 6.3.5.

Functionality Added or Changed

- Changed how the procedure schema collection is retrieved. If the connection string contains "`use procedure bodies=true`" then a `SELECT` is performed on the `mysql.proc` table directly, as this is up to 50 times faster than the current Information Schema implementation. If the connection string contains "`use procedure bodies=false`", then the Information Schema collection is queried. (Bug #36694)

Bugs Fixed

- The `MySqlTokenizer` contained unnecessary `Substring` and `Trim` calls:

```
string token = sql.Substring(startIndex, stopIndex - startIndex).Trim();
```

  The variable `token` was not used anywhere in the code. (Bug #58757)

- `MembershipProvider` did not generate hashes correctly if the algorithm was keyed. The Key of the algorithm should have been set if the `HashAlgorithm` was `KeyedHashAlgorithm`. (Bug #58906)

- When attempting to create an ADO.NET Entity Data Model, MySQL connections were not available. (Bug #58278)

- `MySqlCommand.ExecuteReader(CommandBehavior)` threw a `NullReferenceException` when being called with `CommandBehavior.CloseConnection`, if the SQL statement contained a syntax error, or contained invalid data such as an invalid column name. (Bug #58652)

- The ADO.NET Entity Data Model could not add stored procedures from MySQL Server 5.0.45 but worked fine using MySQL Server 5.1. (Bug #55349)

- Code introduced to fix bug #54863 proved problematic on .NET version 3.5 and above. (Bug #58853)

- `ReadFieldLength()` returned incorrect value for `BIGINT` autoincrement columns. (Bug #58373)

- Calling the `Read()` method on a `DataReader` obtained from `MySqlHelper.ExecuteReader` generated the following exception:

```
Unhandled Exception: MySql.Data.MySqlClient.MySqlException: Invalid attempt to R
ead when reader is closed.
   at MySql.Data.MySqlClient.MySqlDataReader.Read()
   at MySqlTest.MainClass.Main(String[] args)
```

  (Bug #57501)

- MySQL Connector/Net did not support the `utf8mb4` character set. When attempting to connect to `utf8mb4` tables or columns, an exception `KeyNotFoundException` was generated. (Bug #58244)

- Default values returned for text columns were not quoted. This meant that the `COLUMN_DEFAULT` field of the `GetSchema` columns collection did not return a valid SQL expression. (Bug #56509)

- When using MySQL Connector/Net on Mono 2.8 using .NET 4.0, attempting to connect to a MySQL database generated the following exception:

```
Unhandled Exception: System.MissingMethodException: Method not found:
 'System.Data.Common.DbConnection.EnlistTransaction'.
  at (wrapper remoting-invoke-with-check)
 MySql.Data.MySqlClient.MySqlConnection:Open ()
```

(Bug #56509)

- When the tracing driver was used and an SQL statement was longer than 300 characters, an ArgumentOutOfRangeExcpetion occurred if the statement also contained a quoted character, and the 300th character was in the middle of a quoted token. (Bug #57641)
- MySQL Connector/Net for .NET/Mono attempted to dynamically load the assembly `Mono.Posix.dll` when a Unix socket was used to connect to the server. This failed and the connector was not able to use a Unix socket unless the `Mono.Posix.dll` assembly was previously loaded by the program. (Bug #56410)
- Installation of MySQL Connector/Net 6.3.5 failed. The error reported was:

```
MySQL Connector Net 6.3.5 Setup Wizard ended
prematurely because of an error. Your system has not been modified.
```

(Bug #57654)

- In the ADO.NET Entity Data Model Wizard, the time to update a model scaled abnormally as the number of entities increased. (Bug #48791, Bug #12596237)

Changes in MySQL Connector/Net 6.3.5 (2010-10-12)

This release fixes bugs since 6.3.4.

Bugs Fixed

- A typed dataset did not get the table name. (Bug #57894, Bug #11764989)
- Setting `MySqlCommand.CommandTimeout` to 0 had no effect. It should have resulted in an infinite timeout. (Bug #57265)
- When an output parameter was declared as type `MySqlDbType.Bit`, it failed to return with the correct value. (Bug #56756)
- When performing a row-by-row update, only the first row was updated and all other rows were ignored. (Bug #57092)
- Setting the `Default Command Timeout` connection string option had no effect. (Bug #56806)
- MySQL Connector/Net experienced two problems as follows:

  1. A call to `System.Data.Objects.ObjectContext.DatabaseExists()` returned false, even if the database existed.
  2. A call to `System.Data.Objects.ObjectContext.CreateDatabase()` created a database but with a name other than the one specified in the connection string. It then failed to use it when EDM objects were processed.

  (Bug #56859)
- `MySqlHelper.ExecuteReader` did not include an overload accepting `MySqlParameter` objects when using a `MySqlConnection`. However, `MySqlHelper` did include an overload for `MySqlParameter` objects when using a string object containing the connection string to the database. (Bug #56755)
- MySQL Connector/Net 6.1.3 (GA) would not install on a Windows Server 2008 (Web Edition) clean installation. There were two problems:
  - If .NET framework version 4.0 was not installed, installation failed because c:\windows \microsoft.net\v4.0.* did not exist.
  - If .NET 4.0 was subsequently installed, then the following error was generated:

```
InstallFiles: File: MySql.Data.Entity.dll,  Directory: ,  Size: 229888
MSI (s) (E0:AC) [15:20:26:196]: Assembly Error:The assembly is built by a runtime newer
than the currently loaded runtime, and cannot be loaded.
MSI (s) (E0:AC) [15:20:26:196]: Note: 1: 1935 2:  3: 0x8013101B 4: IStream 5: Commit 6:
MSI (s) (E0:A0) [15:20:26:196]: Note: 1: 1304 2: MySql.Data.Entity.dll
Error 1304. Error writing to file: MySql.Data.Entity.dll. Verify that you have access to
that directory.
```

(Bug #56580)

Changes in MySQL Connector/Net 6.3.4 (2010-09-01, Generally Available)

First GA release. This release fixes bugs since 6.3.3.

Bugs Fixed

- Attempting to read `Double.MinValue` from a `DOUBLE` column in MySQL table generated the following exception:

```
System.OverflowException : Value was either too large or too small for a Double.

--OverflowException
at System.Number.ParseDouble(String value, NumberStyles options, NumberFormatInfo
numfmt)
at MySql.Data.Types.MySqlDouble.MySql.Data.Types.IMySqlValue.ReadValue(MySqlPacket
packet, Int64 length, Boolean nullVal)
at MySql.Data.MySqlClient.NativeDriver.ReadColumnValue(Int32 index, MySqlField field,
IMySqlValue valObject)
at MySql.Data.MySqlClient.ResultSet.ReadColumnData(Boolean outputParms)
at MySql.Data.MySqlClient.ResultSet.NextRow(CommandBehavior behavior)
at MySql.Data.MySqlClient.MySqlDataReader.Read()
```

(Bug #55644)

- The calculation of `lockAge` in the Session Provider sometimes generated a `System.Data.SqlTypes.SqlNullValueException`. (Bug #55701)

- If using MySQL Server 5.0.x it was not possible to alter stored routines in Visual Studio. If the stored routine was clicked, and the context sensitive menu option, Alter Routine, selected, the following error was generated:

```
Unable to load object with error: Object reference not
set to an instance of an object
```

(Bug #55170)

- Calling `MySqlDataAdapter.Update(DataTable)` resulted in an unacceptable performance hit when updating large amounts of data. (Bug #55609)

- Stored procedure enumeration code generated an error if a procedure was used in a dataset that did not return any resultsets. (Bug #50671)

- EventLog was not disposed in the SessionState provider. (Bug #52550)

- When attempting to carry out an operation such as:

```
from p in db.Products where p.PostedDate>=DateTime.Now select p;
```

Where `p.PostedDate` is a `DateTimeOffset`, and the underlying column type is a `TIMESTAMP`, the following exception was generated:

```
MySqlException occurred
Unable to serialize date/time value
```

MySQL Connector/Net has now been changed so that all `TIMESTAMP` columns will be surfaced as `DateTime`. (Bug #52550)

- The `INSERT` command was significantly slower with MySQL Connector/Net 6.x compared to 5.x, when compression was enabled. (Bug #48243)
- Opening a connection in the Visual Studio Server Explorer and choosing to alter an existing routine required another authentication at the server. (Bug #44715)

Changes in MySQL Connector/Net 6.3.3 (2010-07-27)

This release fixes bugs since 6.3.2.

Bugs Fixed

- MySQL Connector/Net 6.3.2 failed to install on Windows Vista. (Bug #53975)
- MySQL Connector/Net did not process `Thread.Abort()` correctly, and failed to cancel queries currently running on the server. (Bug #54012)
- MySQL Connector/Net did not throw an `EndOfStreamException` exception when `net_write_timeout` was exceeded. (Bug #53439)
- The icon for the MySQL Web Configuration Tool was not displayed in Visual Studio for Web Application Projects. (Bug #54571)
- `MySqlDataAdapter.Update()` generated concurrency violations for custom stored procedure driven update commands that used `UpdateRowSource.FirstReturnedRecord`. (Bug #54895)
- Several calls to `DataAdapter.Update()` with intervening changes to `DataTable` resulted in `ConcurrencyException` exceptions being generated. (Bug #54863)
- MySQL Connector/Net generated a null reference exception when `TransactionScope` was used by multiple threads. (Bug #54681)
- If `MySqlDataAdapter` was used with an `INSERT` command where the `VALUES` clause contained an expression with parentheses in it, and set the `adapter.UpdateBatchSize` parameter to be greater than one, then the call to `adapter.Update` either generated an exception or failed to batch the commands, executing each insert individually. (Bug #54386)
- The `MySqlHelper` object did not have an overloaded version of the `ExecuteReader` method that accepted a `MySqlConnection` object. (Bug #54570)
- Garbage Collector disposal of a `MySqlConnection` object caused the following exception:

```
System.IO.EndOfStreamException: Attempted to read past the end of the stream.
MySql.Data.MySqlClient.MySqlStream.ReadFully(Stream stream, Byte[] buffer, Int32 offset,
Int32 count)
MySql.Data.MySqlClient.MySqlStream.LoadPacket()
Outer Exception Reading from the stream has failed.
...
```

  (Bug #53457)

- After a timeout exception, if an attempt was made to reuse a connection returned to the connection pool the following exception was generated:

```
[MySqlException (0x80004005): There is already an open DataReader associated with this
Connection which must be closed first.]
   MySql.Data.MySqlClient.MySqlCommand.CheckState() +278
   MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior) +43
   MySql.Data.MySqlClient.MySqlCommand.ExecuteReader() +6
   Controls.SimpleCommand.ExecuteReader(String SQL) in ...:323
   Albums.GetImagesByAlbum(SimpleCommand Cmd, Int32 iAlbum, String Order, String Limit)
in ...:13
   Forecast.Page_Load(Object sender, EventArgs e) in ...:70
   System.Web.UI.Control.OnLoad(EventArgs e) +99
   System.Web.UI.Control.LoadRecursive() +50
```

```
   System.Web.UI.Page.ProcessRequestMain(Boolean includeStagesBeforeAsyncPoint, Boolean
includeStagesAfterAsyncPoint) +627
```

(Bug #53357)

- The method `MySql.Data.Common.QueryNormalizer.CollapseValueList` generated an `ArgumentOutOfRangeException`. (Bug #54152, Bug #53865)
- Membership schema creation failed if the default schema collation was not Latin1. (Bug #53174)
- `CHAR(36)` columns were not recognized as GUIDs when used in views with entity models. (Bug #52085)
- The MySQL Connector/Net installation failed due to `machine.config` files not being present in configuration folders.

  MySQL Connector/Net has been changed to skip over configuration folders that do not contain a `machine.config` file. (Bug #52352)
- When an application was subjected to increased concurrent load, MySQL Connector/Net generated the following error when calling stored procedures:

```
A DataTable named \'Procedure Parameters\'
already belongs to this DataSet.
```

(Bug #49118)

- When the connection string option “Connection Reset = True” was used, a connection reset used the previously used encoding for the subsequent authentication operation. This failed, for example, if UCS2 was used to read the last column before the reset. (Bug #47153)
- When batching was used in `MySqlDataAdapter`, a connection was not opened automatically in `MySqlDataAdapter.Update()`. This resulted in an `InvalidOperationException` exception being generated, with the message text “connection must be valid and open”.

  MySQL Connector/Net has been changed to behave more like SQL Server: if the connection is closed, it is opened for the duration of update operation. (Bug #38411)
- Database name was emitted into typed datasets. This prevented users using the configured default database. (Bug #33870)

Changes in MySQL Connector/Net 6.3.2 (2010-05-24, beta)

First Beta release. This release fixes bugs since 6.3.1.

Functionality Added or Changed

- Procedure caching had a problem whereby if you created a procedure, dropped it, and recreated it with a different number of parameters an exception was generated.

  MySQL Connector/Net has been changed so that if the procedure is recreated with a different number of parameters, it will still be recognized. (Bug #52562)
- MySQL Connector/Net has been changed to include `MySqlDataReader.GetFieldType(string columnname)`. Further, `MySqlDataReader.GetOrdinal()` now includes the name of the column in the exception if the column is not found. (Bug #47467)

Bugs Fixed

- After an exception, the internal datareader, `MySqlCommand.Connection.Reader`, was not properly closed (it was not set to null). If another query was subsequently executed on that command object an exception was generated with the message “There is already an open DataReader associated with this Connection which must be closed first.” (Bug #55558)

- MySQL Connector/Net generated an exception when used to read a `TEXT` column containing more than 32767 bytes. (Bug #54040)
- In MySQL Connector/Net, the `MySqlConnection.Abort()` method contained a `try...catch` construct, with an empty `catch` block. This meant that any exception generated at this point would not be caught. (Bug #52769)
- The procedure cache affected the MySQL Connector/Net performance, reducing it by around 65%. This was due to unnecessary calls of `String.Format()`, related to debug logging. Even though the logging was disabled the string was still being formatted, resulting in impaired performance. (Bug #52475)
- If `FunctionsReturnString=true` was used in the connection string, the decimal separator (according to locale) was not interpreted. (Bug #52187)
- In MySQL Connector/Net, the `LoadCharsetMap()` function of the `CharSetMap` class set the following incorrect mapping:

  ```
  mapping.Add("latin1", new CharacterSet("latin1", 1));
  ```

  This meant that, for example, the Euro sign was not handled correctly.

  The correct mapping should have been:

  ```
  mapping.Add("latin1", new CharacterSet("windows-1252", 1));
  ```

  This is because MySQL's `latin1` character set is the same as the `windows-cp1252` character set and it extends the official ISO 8859-1 or IANA latin1. (Bug #51927)
- A non-terminated string in SQL threw a CLR exception rather than a syntax exception. (Bug #51788)
- When using table per type inheritance and listing the contents of the parent table, the result of the query was a list of child objects, even though there was no related child record with the same parent Id. (Bug #49850)
- MySQL Connector/Net 6.3.1 failed to install. (Bug #51407, Bug #51604)
- When calling `ExecuteNonQuery` on a command object, the following exception occurred:

  ```
  Index and length must refer to a location within the string.
  Parameter name: length
  ```

  (Bug #51610)

Changes in MySQL Connector/Net 6.3.1 (2010-03-02)

This release fixes bugs since 6.3.0.

Functionality Added or Changed

- Connector/Net was not compatible with Visual Studio wizards that used square brackets to delimit symbols.

  Connector/Net has been changed to include a new connection string option `Sql Server mode` that supports use of square brackets to delimit symbols. (Bug #35852)

Bugs Fixed

- Binary Columns were not displayed in the Query Builder of Visual Studio. (Bug #50171)
- `MySqlCommand.Parameters.Clear()` did not work. (Bug #50444)
- When the `UpdateBatchSize` property was set to a value greater than 1, only the first row was applied to the database. (Bug #50123)

- The method `Command.TrimSemicolons` used `StringBuilder`, and therefore allocated memory for the query even if it did not need to be trimmed. This led to excessive memory consumption when executing a number of large queries. (Bug #51149)

- Specifying a connection string where an option had no value generated an error, rather than the value being set to the default. For example, a connection string such as the following would result in an error:

```
server=localhost;user=root;compress=;database=test;port=3306;password=123456;
```

  (Bug #51209)

- When trying to create stored procedures from an SQL script, a `MySqlException` was thrown when attempting to redefine the `DELIMITER`:

```
MySql.Data.MySqlClient.MySqlException was unhandled
Message="You have an error in your SQL syntax; check the manual that corresponds to your
MySQL server version for the right syntax to use near 'DELIMITER' at line 1"
Source="MySql.Data"
ErrorCode=-2147467259
Number=1064
StackTrace:
à MySql.Data.MySqlClient.MySqlStream.ReadPacket()
à MySql.Data.MySqlClient.NativeDriver.ReadResult(UInt64& affectedRows, Int64&
lastInsertId)
à MySql.Data.MySqlClient.MySqlDataReader.GetResultSet()
à MySql.Data.MySqlClient.MySqlDataReader.NextResult()
à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior)
à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader()
à MySql.Data.MySqlClient.MySqlCommand.ExecuteNonQuery()
à MySql.Data.MySqlClient.MySqlScript.Execute()
```

  Note: The `MySqlScript` class has been fixed to support the delimiter statement as it is found in SQL scripts. (Bug #46429)

- A connection string set in `web.config` could not be reused after Visual Studio 2008 Professional was shut down. It continued working for the existing controls, but did not work for new controls added. (Bug #41629)

Changes in MySQL Connector/Net 6.3.0 (2010-02-16, alpha)

First alpha release of 6.3.

Functionality Added or Changed

- Nested transaction scopes were not supported. MySQL Connector/Net now implements nested transaction scopes. A per-thread stack of scopes is maintained, which is necessary to handle nested scopes with the `RequiresNew` or `Suppress` options. (Bug #45098)

- Support for MySQL Server 4.1 has been removed from MySQL Connector/Net starting with version 6.3.0. The connector will now throw an exception if you try to connect to a server of version less than 5.0.

Bugs Fixed

- The method `MySqlDataReader.GetSchemaTable()` returned 0 in the `NumericPrecision` field for decimal and newdecimal columns. (Bug #48171)

- Attempting to execute a load data local infile on a file where the user did not have write permissions, or the file was open in an editor gave an access denied error. (Bug #48944)

- When adding a data set in Visual Studio 2008, the following error was generated:

```
Relations couldn't be added. Column 'REFERENCED_TABLE_CATALOG' does not belong to table.
```

This was due to a 'REFERENCED_TABLE_CATALOG' column not being included in the foreign keys collection. (Bug #48974)

Changes in MySQL Connector/Net Version 6.2.x

Changes in MySQL Connector/Net 6.2.6 (Not yet released)

This release fixes bugs since 6.2.5.

Version 6.2.6 has no changelog entries.

Changes in MySQL Connector/Net 6.2.5 (2011-07-01)

This release fixes bugs since 6.2.4.

Bugs Fixed

- `MySQLConnectionStringBuilder.ContainsKey()` incorrectly returned `false` when testing whether a keyword was part of the connection string. (Bug #11766671, Bug #59835)
- Modified `MySqlConnection.BeginTransaction` to throw a `NotSupportedException` for `Snapshot` isolation level. (Bug #61589, Bug #12698020)
- `SchemaDefinition-5.5.ssdl` was modified to treat `CHAR(36)` columns as a GUID. (Bug #61657, Bug #12708208)
- `SqlFragment.QuoteIdentifier` was modified to add MySQL quotes around identifiers. (Bug #61635, Bug #12707285)
- Modified `ProviderManifest.xml` to map `TIMESTAMP` database columns to the `DateTime` .NET type. (Bug #55351, Bug #12652602)
- A `NullReferenceException` was thrown on disposal of a `TransactionScope` object. (Bug #59346, Bug #11766272)
- MySQL Connector/Net generated an exception when executing a query consisting of ';', for example:

```
mycmd(";",mycon)
mycmd.executenonquery()
```

  The exception generated was:

```
System.IndexOutOfRangeException: Index was outside the bounds of the array.
   at MySql.Data.MySqlClient.MySqlCommand.TrimSemicolons(String sql)
   at MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior)
   at MySql.Data.MySqlClient.MySqlCommand.ExecuteReader()
   at MySql.Data.MySqlClient.MySqlCommand.ExecuteNonQuery()
```

  (Bug #59537, Bug #11766433)
- A typed dataset did not get the table name. (Bug #57894, Bug #11764989)
- `MysqlDataReader.GetSchemaTable` returned incorrect values and types. (Bug #59989, Bug #11776346)
- Setting `Membership.ApplicationName` had no effect. (Bug #59438, Bug #11770465)
- All queries other than `INSERT` were executed individually instead of as a batch even though batching was enabled for the connection. (Bug #59616, Bug #11850286)
- The `MySqlTokenizer` contained unnecessary `Substring` and `Trim` calls:

```
string token = sql.Substring(startIndex, stopIndex - startIndex).Trim();
```

  The variable `token` was not used anywhere in the code. (Bug #58757)

- `MembershipProvider` did not generate hashes correctly if the algorithm was keyed. The Key of the algorithm should have been set if the `HashAlgorithm` was `KeyedHashAlgorithm`. (Bug #58906)
- `MySqlCommand.ExecuteReader(CommandBehavior)` threw a `NullReferenceException` when being called with `CommandBehavior.CloseConnection`, if the SQL statement contained a syntax error, or contained invalid data such as an invalid column name. (Bug #58652)
- The ADO.NET Entity Data Model could not add stored procedures from MySQL Server 5.0.45 but worked fine using MySQL Server 5.1. (Bug #55349)
- Code introduced to fix bug #54863 proved problematic on .NET version 3.5 and above. (Bug #58853)
- `ReadFieldLength()` returned incorrect value for `BIGINT` autoincrement columns. (Bug #58373)
- MySQL Connector/Net did not support the `utf8mb4` character set. When attempting to connect to `utf8mb4` tables or columns, an exception `KeyNotFoundException` was generated. (Bug #58244)
- Default values returned for text columns were not quoted. This meant that the `COLUMN_DEFAULT` field of the `GetSchema` columns collection did not return a valid SQL expression. (Bug #56509)
- MySQL Connector/Net for .NET/Mono attempted to dynamically load the assembly `Mono.Posix.dll` when a Unix socket was used to connect to the server. This failed and the connector was not able to use a Unix socket unless the `Mono.Posix.dll` assembly was previously loaded by the program. (Bug #56410)
- Setting `MySqlCommand.CommandTimeout` to 0 had no effect. It should have resulted in an infinite timeout. (Bug #57265)
- When an output parameter was declared as type `MySqlDbType.Bit`, it failed to return with the correct value. (Bug #56756)
- When performing a row-by-row update, only the first row was updated and all other rows were ignored. (Bug #57092)
- Setting the `Default Command Timeout` connection string option had no effect. (Bug #56806)
- `MySqlHelper.ExecuteReader` did not include an overload accepting `MySqlParameter` objects when using a `MySqlConnection`. However, `MySqlHelper` did include an overload for `MySqlParameter` objects when using a string object containing the connection string to the database. (Bug #56755)
- Fixed Entity Framework provider `GROUP BY` clause generation by adding all group-by keys to the `SELECT` statement. (Bug #46742, Bug #12622129)

Changes in MySQL Connector/Net 6.2.4 (2010-08-30)

This release fixes bugs since 6.2.3.

Functionality Added or Changed

- Procedure caching had a problem whereby if you created a procedure, dropped it, and recreated it with a different number of parameters an exception was generated.

  MySQL Connector/Net has been changed so that if the procedure is recreated with a different number of parameters, it will still be recognized. (Bug #52562)

Bugs Fixed

- Attempting to read `Double.MinValue` from a `DOUBLE` column in MySQL table generated the following exception:

```
System.OverflowException : Value was either too large or too small for a Double.

--OverflowException
at System.Number.ParseDouble(String value, NumberStyles options, NumberFormatInfo
numfmt)
at MySql.Data.Types.MySqlDouble.MySql.Data.Types.IMySqlValue.ReadValue(MySqlPacket
packet, Int64 length, Boolean nullVal)
at MySql.Data.MySqlClient.NativeDriver.ReadColumnValue(Int32 index, MySqlField field,
IMySqlValue valObject)
at MySql.Data.MySqlClient.ResultSet.ReadColumnData(Boolean outputParms)
at MySql.Data.MySqlClient.ResultSet.NextRow(CommandBehavior behavior)
at MySql.Data.MySqlClient.MySqlDataReader.Read()
```

(Bug #55644)

- The calculation of `lockAge` in the Session Provider sometimes generated a `System.Data.SqlTypes.SqlNullValueException`. (Bug #55701)
- If using MySQL Server 5.0.x it was not possible to alter stored routines in Visual Studio. If the stored routine was clicked, and the context sensitive menu option, Alter Routine, selected, the following error was generated:

```
Unable to load object with error: Object reference not
set to an instance of an object
```

(Bug #55170)

- After an exception, the internal datareader, `MySqlCommand.Connection.Reader`, was not properly closed (it was not set to null). If another query was subsequently executed on that command object an exception was generated with the message “There is already an open DataReader associated with this Connection which must be closed first.” (Bug #55558)
- MySQL Connector/Net did not process `Thread.Abort()` correctly, and failed to cancel queries currently running on the server. (Bug #54012)
- MySQL Connector/Net did not throw an `EndOfStreamException` exception when `net_write_timeout` was exceeded. (Bug #53439)
- The icon for the MySQL Web Configuration Tool was not displayed in Visual Studio for Web Application Projects. (Bug #54571)
- `MySqlDataAdapter.Update()` generated concurrency violations for custom stored procedure driven update commands that used `UpdateRowSource.FirstReturnedRecord`. (Bug #54895)
- Several calls to `DataAdapter.Update()` with intervening changes to `DataTable` resulted in `ConcurrencyException` exceptions being generated. (Bug #54863)
- If `MySqlDataAdapter` was used with an `INSERT` command where the `VALUES` clause contained an expression with parentheses in it, and set the `adapter.UpdateBatchSize` parameter to be greater than one, then the call to `adapter.Update` either generated an exception or failed to batch the commands, executing each insert individually. (Bug #54386)
- The `MySqlHelper` object did not have an overloaded version of the `ExecuteReader` method that accepted a `MySqlConnection` object. (Bug #54570)
- Garbage Collector disposal of a `MySqlConnection` object caused the following exception:

```
System.IO.EndOfStreamException: Attempted to read past the end of the stream.
MySql.Data.MySqlClient.MySqlStream.ReadFully(Stream stream, Byte[] buffer, Int32 offset,
Int32 count)
MySql.Data.MySqlClient.MySqlStream.LoadPacket()
Outer Exception Reading from the stream has failed.
...
```

(Bug #53457)

- After a timeout exception, if an attempt was made to reuse a connection returned to the connection pool the following exception was generated:

```
[MySqlException (0x80004005): There is already an open DataReader associated with this
Connection which must be closed first.]
   MySql.Data.MySqlClient.MySqlCommand.CheckState() +278
   MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior) +43
   MySql.Data.MySqlClient.MySqlCommand.ExecuteReader() +6
   Controls.SimpleCommand.ExecuteReader(String SQL) in ...:323
   Albums.GetImagesByAlbum(SimpleCommand Cmd, Int32 iAlbum, String Order, String Limit)
in ...:13
   Forecast.Page_Load(Object sender, EventArgs e) in ...:70
   System.Web.UI.Control.OnLoad(EventArgs e) +99
   System.Web.UI.Control.LoadRecursive() +50
   System.Web.UI.Page.ProcessRequestMain(Boolean includeStagesBeforeAsyncPoint, Boolean
includeStagesAfterAsyncPoint) +627
```

  (Bug #53357)

- The method `MySql.Data.Common.QueryNormalizer.CollapseValueList` generated an `ArgumentOutOfRangeException`. (Bug #54152, Bug #53865)

- In the ADO.NET Entity Data Model Wizard, the time to update a model scaled abnormally as the number of entities increased. (Bug #48791, Bug #12596237)

- Stored procedure enumeration code generated an error if a procedure was used in a dataset that did not return any resultsets. (Bug #50671)

- EventLog was not disposed in the SessionState provider. (Bug #52550)

- The `INSERT` command was significantly slower with MySQL Connector/Net 6.x compared to 5.x, when compression was enabled. (Bug #48243)

- Membership schema creation failed if the default schema collation was not Latin1. (Bug #53174)

- `CHAR(36)` columns were not recognized as GUIDs when used in views with entity models. (Bug #52085)

- When an application was subjected to increased concurrent load, MySQL Connector/Net generated the following error when calling stored procedures:

```
A DataTable named \'Procedure Parameters\'
already belongs to this DataSet.
```

  (Bug #49118)

- In MySQL Connector/Net, the `MySqlConnection.Abort()` method contained a `try...catch` construct, with an empty `catch` block. This meant that any exception generated at this point would not be caught. (Bug #52769)

- The procedure cache affected the MySQL Connector/Net performance, reducing it by around 65%. This was due to unnecessary calls of `String.Format()`, related to debug logging. Even though the logging was disabled the string was still being formatted, resulting in impaired performance. (Bug #52475)

- If `FunctionsReturnString=true` was used in the connection string, the decimal separator (according to locale) was not interpreted. (Bug #52187)

- In MySQL Connector/Net, the `LoadCharsetMap()` function of the `CharSetMap` class set the following incorrect mapping:

```
mapping.Add("latin1", new CharacterSet("latin1", 1));
```

  This meant that, for example, the Euro sign was not handled correctly.

  The correct mapping should have been:

```
mapping.Add("latin1", new CharacterSet("windows-1252", 1));
```

This is because MySQL's `latin1` character set is the same as the `windows-cp1252` character set and it extends the official ISO 8859-1 or IANA latin1. (Bug #51927)

- Periodically the session provider threw an `SqlNullValueException` exception. When this happened, the row within the `my_aspnet_Sessions` table had `locked` always set to '1'. The locked status never changed back to '0' and the user experienced the exception on every page, until their browser was closed and reopened (recreating a new sessionID), or the `locked` value was manually changed to '0'. (Bug #52175)
- When the connection string option “Connection Reset = True” was used, a connection reset used the previously used encoding for the subsequent authentication operation. This failed, for example, if UCS2 was used to read the last column before the reset. (Bug #47153)
- Opening a connection in the Visual Studio Server Explorer and choosing to alter an existing routine required another authentication at the server. (Bug #44715)
- When batching was used in `MySqlDataAdapter`, a connection was not opened automatically in `MySqlDataAdapter.Update()`. This resulted in an `InvalidOperationException` exception being generated, with the message text “connection must be valid and open”.

  MySQL Connector/Net has been changed to behave more like SQL Server: if the connection is closed, it is opened for the duration of update operation. (Bug #38411)
- Database name was emitted into typed datasets. This prevented users using the configured default database. (Bug #33870)

Changes in MySQL Connector/Net 6.2.3 (2010-04-10)

This release fixes bugs since 6.2.2.

Functionality Added or Changed

- MySQL Connector/Net has been changed to include `MySqlDataReader.GetFieldType(string columnname)`. Further, `MySqlDataReader.GetOrdinal()` now includes the name of the column in the exception if the column is not found. (Bug #47467)

Bugs Fixed

- A non-terminated string in SQL threw a CLR exception rather than a syntax exception. (Bug #51788)
- When using table per type inheritance and listing the contents of the parent table, the result of the query was a list of child objects, even though there was no related child record with the same parent Id. (Bug #49850)
- When calling `ExecuteNonQuery` on a command object, the following exception occurred:

```
Index and length must refer to a location within the string.
Parameter name: length
```

(Bug #51610)

- Binary Columns were not displayed in the Query Builder of Visual Studio. (Bug #50171)
- `MySqlCommand.Parameters.Clear()` did not work. (Bug #50444)
- When the `UpdateBatchSize` property was set to a value greater than 1, only the first row was applied to the database. (Bug #50123)
- The method `Command.TrimSemicolons` used `StringBuilder`, and therefore allocated memory for the query even if it did not need to be trimmed. This led to excessive memory consumption when executing a number of large queries. (Bug #51149)

- Specifying a connection string where an option had no value generated an error, rather than the value being set to the default. For example, a connection string such as the following would result in an error:

```
server=localhost;user=root;compress=;database=test;port=3306;password=123456;
```

  (Bug #51209)

- When the `MySqlScript.execute()` method was called, the following exception was generated:

```
InvalidOperationException : The CommandText property has not been properly initialized.
```

  (Bug #50344)

- When using the Compact Framework the following exception occurred when attempting to connect to a MySQL Server:

```
System.InvalidOperationException was unhandled
  Message="Timeouts are not supported on this stream."
```

  (Bug #50321)

- A `FormatException` was generated when an empty string was returned from a stored function. (Bug #49642)

- `MySqlDataReader.GetUInt64` returned an incorrect value when reading a `BIGINT UNSIGNED` column containing a value greater than 2147483647. (Bug #49794)

- Calling a User Defined Function using Entity SQL in the Entity Framework caused a `NullReferenceException`. (Bug #45277)

- When trying to create stored procedures from an SQL script, a `MySqlException` was thrown when attempting to redefine the `DELIMITER`:

```
MySql.Data.MySqlClient.MySqlException was unhandled
Message="You have an error in your SQL syntax; check the manual that corresponds to your
MySQL server version for the right syntax to use near 'DELIMITER' at line 1"
Source="MySql.Data"
ErrorCode=-2147467259
Number=1064
StackTrace:
à MySql.Data.MySqlClient.MySqlStream.ReadPacket()
à MySql.Data.MySqlClient.NativeDriver.ReadResult(UInt64& affectedRows, Int64&
lastInsertId)
à MySql.Data.MySqlClient.MySqlDataReader.GetResultSet()
à MySql.Data.MySqlClient.MySqlDataReader.NextResult()
à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior)
à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader()
à MySql.Data.MySqlClient.MySqlCommand.ExecuteNonQuery()
à MySql.Data.MySqlClient.MySqlScript.Execute()
```

  Note: The `MySqlScript` class has been fixed to support the delimiter statement as it is found in SQL scripts. (Bug #46429)

- A connection string set in `web.config` could not be reused after Visual Studio 2008 Professional was shut down. It continued working for the existing controls, but did not work for new controls added. (Bug #41629)

Changes in MySQL Connector/Net 6.2.2 (2009-12-22, Generally Available)

First GA release of 6.2. This release fixes bugs since 6.2.1.

Bugs Fixed

- The method `MySqlDataReader.GetSchemaTable()` returned 0 in the `NumericPrecision` field for decimal and newdecimal columns. (Bug #48171)

- Attempting to execute a load data local infile on a file where the user did not have write permissions, or the file was open in an editor gave an access denied error. (Bug #48944)
- When adding a data set in Visual Studio 2008, the following error was generated:

```
Relations couldn't be added. Column 'REFERENCED_TABLE_CATALOG' does not belong to table.
```

  This was due to a 'REFERENCED_TABLE_CATALOG' column not being included in the foreign keys collection. (Bug #48974)
- MySQL Connector/Net generated an invalid operation exception during a transaction rollback:

```
System.InvalidOperationException: Connection must be valid and open to rollback
transaction
   at MySql.Data.MySqlClient.MySqlTransaction.Rollback()
   at MySql.Data.MySqlClient.MySqlConnection.CloseFully()
   at
MySql.Data.MySqlClient.MySqlPromotableTransaction.System.Transactions.IPromotableSinglePhaseNotification.
singlePhaseEnlistment)
...
```

  (Bug #35330)
- Connection objects were not garbage collected when not in use. (Bug #31996)

Changes in MySQL Connector/Net 6.2.1 (2009-11-16, beta)

This release fixes bugs since 6.2.0.

Functionality Added or Changed

- The `MySqlParameter` class now has a property named `PossibleValues`. This property is NULL unless the parameter is created by `MySqlCommandBuilder.DeriveParameters`. Further, it will be NULL unless the parameter is of type enum or set - in this case it will be a list of strings that are the possible values for the column. This feature is designed as an aid to the developer. (Bug #48586)
- MySQL Connector/Net now supports the processing of certificates when connecting to an SSL-enabled MySQL Server. For further information see the connection string option SSL Mode in the section Connector/Net Connection String Options Reference and the tutorial Tutorial: Using SSL with MySQL Connector/Net.
- Starting with MySQL Connector/Net 6.2, there is a background job that runs every three minutes and removes connections from pool that have been idle (unused) for more than three minutes. The pool cleanup frees resources on both client and server side. This is because on the client side every connection uses a socket, and on the server side every connection uses a socket and a thread.

  Prior to this change, connections were never removed from the pool, and the pool always contained the peak number of open connections. For example, a web application that peaked at 1000 concurrent database connections would consume 1000 threads and 1000 open sockets at the server, without ever freeing up those resources from the connection pool.
- Prior to MySQL Connector/Net 6.2, `MySqlCommand.CommandTimeout` included user processing time, that is processing time not related to direct use of the connector. Timeout was implemented through a .NET Timer, that triggered after `CommandTimeout` seconds.

  MySQL Connector/Net 6.2 introduced timeouts that are aligned with how Microsoft handles `SqlCommand.CommandTimeout`. This property is the cumulative timeout for all network reads and writes during command execution or processing of the results. A timeout can still occur in the `MySqlReader.Read` method after the first row is returned, and does not include user processing time, only IO operations.

  Further details on this can be found in the relevant Microsoft documentation.

Bugs Fixed

- When building the `MySql.Data` project with .NET Framework 3.5 installed, the following build output was displayed:

  ```
  Project file contains ToolsVersion="4.0", which is not supported by this version of
  MSBuild. Treating the project as if it had ToolsVersion="3.5".
  ```

  The project had been created using the .NET Framework 4.0, which was beta, instead of using the 3.5 framework. (Bug #48271)

- When used, the `Encrypt` connection string option caused a “Keyword not supported” exception to be generated.

  This option is in fact obsolete, and the option SSL Mode should be used instead. Although the `Encrypt` option has been fixed so that it does not generate an exception, it will be removed completely in version 6.4. (Bug #48290)

- Cloning of `MySqlCommand` was not typesafe. To clone a `MySqlCommand` it was necessary to do:

  ```
  MySqlCommand clone = (MySqlCommand)((ICloneable)comm).Clone();
  ```

  MySQL Connector/Net was changed so that it was possible to do:

  ```
  MySqlCommand clone = comm.Clone();
  ```

  (Bug #48460)

- An entity model created from a schema containing a table with a column of type `UNSIGNED BIGINT` and a view of the table did not behave correctly. When an entity was created and mapped to the view, the column that was of type `UNSIGNED BIGINT` was displayed as `BIGINT`. (Bug #47872)

- It was not possible to retrieve a value from a MySQL server table, if the value was larger than that supported by the .NET type `System.Decimal`.

  MySQL Connector/Net was changed to expose the `MySqlDecimal` type, along with the supporting method `GetMySqlDecimal`. (Bug #48100)

- MySQL Connector/Net session support did not work with MySQL Server versions prior to 5.0, as the Session Provider used a call to `TIMESTAMPDIFF`, which was not available on servers prior to 5.0. (Bug #47219)

Changes in MySQL Connector/Net 6.2.0 (2009-10-21, alpha)

The first alpha release of 6.2.

Bugs Fixed

- When using a `BINARY(16)` column to represent a GUID and having specified “old guids = true” in the connection string, the values were returned correctly until a null value was encountered in that field. After the null value was encountered a format exception was thrown with the following message:

  ```
  Guid should contain 32 digits with 4 dashes (xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx).
  ```

  (Bug #47928)

- The Session Provider created invalid “session expires” on a random basis.

  This was due to the fact that the Session Provider was incorrectly reading from the root `web.config`, rather than from the application specific `web.config`. (Bug #47815)

- When loading the `MySQLClient-mono.sln` file included with the Connector/Net source into Mono Develop, the following error occurred:

  ```
  /home/tbedford/connector-net-src/6.1/MySQLClient-mono.sln(22):
  ```

```
Unsupported or unrecognized project:
'/home/tbedford/connector-net-src/6.1/Installer/Installer.wixproj'
```

If the file was modified to remove this problem, then attempting to build the solution generated the following error:

```
/home/tbedford/connector-net-src/6.1/MySql.Data/Provider/Source/Connection.cs(280,46):
error CS0115: `MySql.Data.MySqlClient.MySqlConnection.DbProviderFactory' is marked as an
override but no suitable property found to override
```

(Bug #47048)

Changes in MySQL Connector/Net Version 6.1.x

Changes in MySQL Connector/Net 6.1.7 (Not released, Generally Available)

This release fixes bugs since 6.1.6.

Version 6.1.7 has no changelog entries.

Changes in MySQL Connector/Net 6.1.6 (Not released, Generally Available)

This release fixes bugs since 6.1.5.

Version 6.1.6 has no changelog entries.

Changes in MySQL Connector/Net 6.1.5 (2010-08-30, Generally Available)

This release fixes bugs since 6.1.4.

Bugs Fixed

- Attempting to read `Double.MinValue` from a `DOUBLE` column in MySQL table generated the following exception:

```
System.OverflowException : Value was either too large or too small for a Double.

--OverflowException
at System.Number.ParseDouble(String value, NumberStyles options, NumberFormatInfo
numfmt)
at MySql.Data.Types.MySqlDouble.MySql.Data.Types.IMySqlValue.ReadValue(MySqlPacket
packet, Int64 length, Boolean nullVal)
at MySql.Data.MySqlClient.NativeDriver.ReadColumnValue(Int32 index, MySqlField field,
IMySqlValue valObject)
at MySql.Data.MySqlClient.ResultSet.ReadColumnData(Boolean outputParms)
at MySql.Data.MySqlClient.ResultSet.NextRow(CommandBehavior behavior)
at MySql.Data.MySqlClient.MySqlDataReader.Read()
```

(Bug #55644)

- The calculation of `lockAge` in the Session Provider sometimes generated a `System.Data.SqlTypes.SqlNullValueException`. (Bug #55701)

- If using MySQL Server 5.0.x it was not possible to alter stored routines in Visual Studio. If the stored routine was clicked, and the context sensitive menu option, Alter Routine, selected, the following error was generated:

```
Unable to load object with error: Object reference not
set to an instance of an object
```

(Bug #55170)

- MySQL Connector/Net did not throw an `EndOfStreamException` exception when `net_write_timeout` was exceeded. (Bug #53439)

- The icon for the MySQL Web Configuration Tool was not displayed in Visual Studio for Web Application Projects. (Bug #54571)
- `MySqlDataAdapter.Update()` generated concurrency violations for custom stored procedure driven update commands that used `UpdateRowSource.FirstReturnedRecord`. (Bug #54895)
- Several calls to `DataAdapter.Update()` with intervening changes to `DataTable` resulted in `ConcurrencyException` exceptions being generated. (Bug #54863)
- If `MySqlDataAdapter` was used with an `INSERT` command where the `VALUES` clause contained an expression with parentheses in it, and set the `adapter.UpdateBatchSize` parameter to be greater than one, then the call to `adapter.Update` either generated an exception or failed to batch the commands, executing each insert individually. (Bug #54386)
- The `MySqlHelper` object did not have an overloaded version of the `ExecuteReader` method that accepted a `MySqlConnection` object. (Bug #54570)
- Garbage Collector disposal of a `MySqlConnection` object caused the following exception:

```
System.IO.EndOfStreamException: Attempted to read past the end of the stream.
MySql.Data.MySqlClient.MySqlStream.ReadFully(Stream stream, Byte[] buffer, Int32 offset,
Int32 count)
MySql.Data.MySqlClient.MySqlStream.LoadPacket()
Outer Exception Reading from the stream has failed.
...
```

  (Bug #53457)

- After a timeout exception, if an attempt was made to reuse a connection returned to the connection pool the following exception was generated:

```
[MySqlException (0x80004005): There is already an open DataReader associated with this
Connection which must be closed first.]
   MySql.Data.MySqlClient.MySqlCommand.CheckState() +278
   MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior) +43
   MySql.Data.MySqlClient.MySqlCommand.ExecuteReader() +6
   Controls.SimpleCommand.ExecuteReader(String SQL) in ...:323
   Albums.GetImagesByAlbum(SimpleCommand Cmd, Int32 iAlbum, String Order, String Limit)
in ...:13
   Forecast.Page_Load(Object sender, EventArgs e) in ...:70
   System.Web.UI.Control.OnLoad(EventArgs e) +99
   System.Web.UI.Control.LoadRecursive() +50
   System.Web.UI.Page.ProcessRequestMain(Boolean includeStagesBeforeAsyncPoint, Boolean
includeStagesAfterAsyncPoint) +627
```

  (Bug #53357)

- The method `MySql.Data.Common.QueryNormalizer.CollapseValueList` generated an `ArgumentOutOfRangeException`. (Bug #54152, Bug #53865)
- In the ADO.NET Entity Data Model Wizard, the time to update a model scaled abnormally as the number of entities increased. (Bug #48791, Bug #12596237)
- Stored procedure enumeration code generated an error if a procedure was used in a dataset that did not return any resultsets. (Bug #50671)
- EventLog was not disposed in the SessionState provider. (Bug #52550)
- The `INSERT` command was significantly slower with MySQL Connector/Net 6.x compared to 5.x, when compression was enabled. (Bug #48243)
- Membership schema creation failed if the default schema collation was not Latin1. (Bug #53174)
- `CHAR(36)` columns were not recognized as GUIDs when used in views with entity models. (Bug #52085)

- When an application was subjected to increased concurrent load, MySQL Connector/Net generated the following error when calling stored procedures:

```
A DataTable named \'Procedure Parameters\'
already belongs to this DataSet.
```

  (Bug #49118)

- When the connection string option “Connection Reset = True” was used, a connection reset used the previously used encoding for the subsequent authentication operation. This failed, for example, if UCS2 was used to read the last column before the reset. (Bug #47153)

- Opening a connection in the Visual Studio Server Explorer and choosing to alter an existing routine required another authentication at the server. (Bug #44715)

- When batching was used in `MySqlDataAdapter`, a connection was not opened automatically in `MySqlDataAdapter.Update()`. This resulted in an `InvalidOperationException` exception being generated, with the message text “connection must be valid and open”.

  MySQL Connector/Net has been changed to behave more like SQL Server: if the connection is closed, it is opened for the duration of update operation. (Bug #38411)

- Database name was emitted into typed datasets. This prevented users using the configured default database. (Bug #33870)

Changes in MySQL Connector/Net 6.1.4 (2010-04-28, Generally Available)

This release fixes bugs since 6.1.3.

Functionality Added or Changed

- Procedure caching had a problem whereby if you created a procedure, dropped it, and recreated it with a different number of parameters an exception was generated.

  MySQL Connector/Net has been changed so that if the procedure is recreated with a different number of parameters, it will still be recognized. (Bug #52562)

- MySQL Connector/Net has been changed to include `MySqlDataReader.GetFieldType(string columnname)`. Further, `MySqlDataReader.GetOrdinal()` now includes the name of the column in the exception if the column is not found. (Bug #47467)

Bugs Fixed

- In MySQL Connector/Net, the `MySqlConnection.Abort()` method contained a `try...catch` construct, with an empty `catch` block. This meant that any exception generated at this point would not be caught. (Bug #52769)

- If `FunctionsReturnString=true` was used in the connection string, the decimal separator (according to locale) was not interpreted. (Bug #52187)

- In MySQL Connector/Net, the `LoadCharsetMap()` function of the `CharSetMap` class set the following incorrect mapping:

```
mapping.Add("latin1", new CharacterSet("latin1", 1));
```

  This meant that, for example, the Euro sign was not handled correctly.

  The correct mapping should have been:

```
mapping.Add("latin1", new CharacterSet("windows-1252", 1));
```

  This is because MySQL's `latin1` character set is the same as the `windows-cp1252` character set and it extends the official ISO 8859-1 or IANA latin1. (Bug #51927)

- A non-terminated string in SQL threw a CLR exception rather than a syntax exception. (Bug #51788)
- When using table per type inheritance and listing the contents of the parent table, the result of the query was a list of child objects, even though there was no related child record with the same parent Id. (Bug #49850)
- When calling `ExecuteNonQuery` on a command object, the following exception occurred:

  ```
  Index and length must refer to a location within the string.
  Parameter name: length
  ```

  (Bug #51610)
- Binary Columns were not displayed in the Query Builder of Visual Studio. (Bug #50171)
- `MySqlCommand.Parameters.Clear()` did not work. (Bug #50444)
- When the `UpdateBatchSize` property was set to a value greater than 1, only the first row was applied to the database. (Bug #50123)
- The method `Command.TrimSemicolons` used `StringBuilder`, and therefore allocated memory for the query even if it did not need to be trimmed. This led to excessive memory consumption when executing a number of large queries. (Bug #51149)
- When the `MySqlScript.execute()` method was called, the following exception was generated:

  ```
  InvalidOperationException : The CommandText property has not been properly initialized.
  ```

  (Bug #50344)
- A `FormatException` was generated when an empty string was returned from a stored function. (Bug #49642)
- `MySqlDataReader.GetUInt64` returned an incorrect value when reading a `BIGINT UNSIGNED` column containing a value greater than 2147483647. (Bug #49794)
- Calling a User Defined Function using Entity SQL in the Entity Framework caused a `NullReferenceException`. (Bug #45277)
- The method `MySqlDataReader.GetSchemaTable()` returned 0 in the `NumericPrecision` field for decimal and newdecimal columns. (Bug #48171)
- Attempting to execute a load data local infile on a file where the user did not have write permissions, or the file was open in an editor gave an access denied error. (Bug #48944)
- When adding a data set in Visual Studio 2008, the following error was generated:

  ```
  Relations couldn't be added. Column 'REFERENCED_TABLE_CATALOG' does not belong to table.
  ```

  This was due to a 'REFERENCED_TABLE_CATALOG' column not being included in the foreign keys collection. (Bug #48974)
- When trying to create stored procedures from an SQL script, a `MySqlException` was thrown when attempting to redefine the `DELIMITER`:

  ```
  MySql.Data.MySqlClient.MySqlException was unhandled
  Message="You have an error in your SQL syntax; check the manual that corresponds to your
  MySQL server version for the right syntax to use near 'DELIMITER' at line 1"
  Source="MySql.Data"
  ErrorCode=-2147467259
  Number=1064
  StackTrace:
  à MySql.Data.MySqlClient.MySqlStream.ReadPacket()
  à MySql.Data.MySqlClient.NativeDriver.ReadResult(UInt64& affectedRows, Int64&
  lastInsertId)
  ```

```
à MySql.Data.MySqlClient.MySqlDataReader.GetResultSet()
à MySql.Data.MySqlClient.MySqlDataReader.NextResult()
à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior)
à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader()
à MySql.Data.MySqlClient.MySqlCommand.ExecuteNonQuery()
à MySql.Data.MySqlClient.MySqlScript.Execute()
```

Note: The `MySqlScript` class has been fixed to support the delimiter statement as it is found in SQL scripts. (Bug #46429)

- A connection string set in `web.config` could not be reused after Visual Studio 2008 Professional was shut down. It continued working for the existing controls, but did not work for new controls added. (Bug #41629)

Changes in MySQL Connector/Net 6.1.3 (2009-11-16, Generally Available)

This release fixes bugs since 6.1.2.

Bugs Fixed

- When building the `MySql.Data` project with .NET Framework 3.5 installed, the following build output was displayed:

```
Project file contains ToolsVersion="4.0", which is not supported by this version of
MSBuild. Treating the project as if it had ToolsVersion="3.5".
```

The project had been created using the .NET Framework 4.0, which was beta, instead of using the 3.5 framework. (Bug #48271)

- Cloning of `MySqlCommand` was not typesafe. To clone a `MySqlCommand` it was necessary to do:

```
MySqlCommand clone = (MySqlCommand)((ICloneable)comm).Clone();
```

MySQL Connector/Net was changed so that it was possible to do:

```
MySqlCommand clone = comm.Clone();
```

(Bug #48460)

- An entity model created from a schema containing a table with a column of type `UNSIGNED BIGINT` and a view of the table did not behave correctly. When an entity was created and mapped to the view, the column that was of type `UNSIGNED BIGINT` was displayed as `BIGINT`. (Bug #47872)

- For some character sets such as UTF-8, a `CHAR` column would sometimes be incorrectly interpreted as a `GUID` by MySQL Connector/Net.

  MySQL Connector/Net was changed so that a column would only be interpreted as a `GUID` if it had a character length of 36, as opposed to a byte length of 36. (Bug #47985)

- It was not possible to retrieve a value from a MySQL server table, if the value was larger than that supported by the .NET type `System.Decimal`.

  MySQL Connector/Net was changed to expose the `MySqlDecimal` type, along with the supporting method `GetMySqlDecimal`. (Bug #48100)

- If `MySqlConnection.GetSchema` was called for "Indexes" on a table named “b`a`d” as follows:

```
DataTable schemaPrimaryKeys = connection.GetSchema(
  "Indexes",
  new string[] { null, schemaName, "b`a`d"});
```

Then the following exception was generated:

```
You have an error in your SQL syntax; check the manual that corresponds to
your MySQL server version for the right syntax to use near 'a`d`' at line 1
```

(Bug #48101)

- When using a `BINARY(16)` column to represent a GUID and having specified “old guids = true” in the connection string, the values were returned correctly until a null value was encountered in that field. After the null value was encountered a format exception was thrown with the following message:

```
Guid should contain 32 digits with 4 dashes (xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx).
```

(Bug #47928)

- The Session Provider created invalid “session expires” on a random basis.

  This was due to the fact that the Session Provider was incorrectly reading from the root `web.config`, rather than from the application specific `web.config`. (Bug #47815)

- Attempting to build MySQL Connector/Net 6.1 `MySQL.Data` from source code on Windows failed with the following error:

```
...\clones\6.1\MySql.Data\Provider\Source\NativeDriver.cs(519,29): error CS0122:
'MySql.Data.MySqlClient.MySqlPacket.MySqlPacket()' is inaccessible due to its protection level
```

(Bug #47354)

- When tables were auto created for the Session State Provider they were set to use the MySQL Server's default collation, rather than the default collation set for the containing database. (Bug #47332)

- When loading the `MySQLClient-mono.sln` file included with the Connector/Net source into Mono Develop, the following error occurred:

```
/home/tbedford/connector-net-src/6.1/MySQLClient-mono.sln(22):
Unsupported or unrecognized project:
'/home/tbedford/connector-net-src/6.1/Installer/Installer.wixproj'
```

  If the file was modified to remove this problem, then attempting to build the solution generated the following error:

```
/home/tbedford/connector-net-src/6.1/MySql.Data/Provider/Source/Connection.cs(280,46):
error CS0115: `MySql.Data.MySqlClient.MySqlConnection.DbProviderFactory' is marked as an
override but no suitable property found to override
```

(Bug #47048)

Changes in MySQL Connector/Net 6.1.2 (2009-09-08, Generally Available)

This is the first GA release of 6.1. This release fixes bugs since 6.1.1.

Bugs Fixed

- The MySQL Connector/Net Session State Provider truncated session data to 64KB, due to its column types being set to `BLOB`. (Bug #47339)

- MySQL Connector/Net generated the following exception when using the Session State provider:

```
You have an error in your SQL syntax; check the manual that corresponds to your MySQL
server version for the right syntax to use near 'MINUTEWHERE SessionId =
'dtmgga55x35oi255nrfrxe45' AND ApplicationId = 1 AND Loc' at line 1
Description: An unhandled exception occurred during the execution of the current web
request. Please review the stack trace for more information about the error and where it
originated in the code.

Exception Details: MySql.Data.MySqlClient.MySqlException: You have an error in your SQL
syntax; check the manual that corresponds to your MySQL server version for the right
syntax to use near 'MINUTEWHERE SessionId = 'dtmgga55x35oi255nrfrxe45' AND ApplicationId =
```

```
1 AND Loc' at line 1
```

(Bug #46939)

- If an error occurred during connection to a MySQL Server, deserializing the error message from the packet buffer caused a `NullReferenceException` to be thrown. When the method `MySqlPacket::ReadString()` attempted to retrieve the error message, the following line of code threw the exception:

```
string s = encoding.GetString(bits, (int)buffer.Position, end - (int)buffer.Position);
```

This was due to the fact that the encoding field had not been initialized correctly. (Bug #46844)

- Input parameters were missing from Stored Procedures when using them with ADO.NET Data Entities. (Bug #44985)
- MySQL Connector/Net did not time out correctly. The command timeout was set to 30 secs, but MySQL Connector/Net hung for several hours. (Bug #43761)

Changes in MySQL Connector/Net 6.1.1 (2009-08-20, beta)

This is the first Beta release of 6.1.

Bugs Fixed

- In the `MySqlDataReader` class the `GetSByte` function returned a `byte` value instead of an `sbyte` value. (Bug #46620)
- An exception was generated when using `TIMESTAMP` columns with the Entity Framework. (Bug #46311)
- Insert into two tables failed when using the Entity Framework. The exception generated was:

```
The value given is not an instance of type 'Edm.Int32'
```

(Bug #45077)

- Conversion of MySQL `TINYINT(1)` to `boolean` failed. (Bug #46205, Bug #46359, Bug #41953)
- Calling the Entity Framework `SaveChanges()` method of any MySQL ORM Entity with a column type `TIME`, generated an error message:

```
Unknown PrimitiveKind Time
```

(Bug #45457)

- The Entity Framework provider was not calling `DBSortExpression` correctly when the `Skip` and `Take` methods were used, such as in the following statement:

```
TestModel.tblquarantine.OrderByDescending(q => q.MsgDate).Skip(100).Take(100).ToList();
```

This resulted in the data being unsorted. (Bug #45723)

- MySQL Connector/Net sometimes hung, without generating an exception. This happened if a read from a stream failed returning a 0, causing the code in `LoadPacket()` to enter an infinite loop. (Bug #46308)
- The MySQL Connector/Net Profile Provider, `MySql.Web.Profile.MySQLProfileProvider`, generated an error when running on Mono. When an attempt was made to save a string in `Profile.Name` the string was not saved to the `my_aspnet_Profiles` table. If an attempt was made to force the save with `Profile.Save()` the following error was generated:

```
Server Error in '/mono' Application

--------------------------------------------------------------------------------
```

```
The requested feature is not implemented.
Description: HTTP 500. Error processing request.

Version information: Mono Version: 2.0.50727.1433; ASP.NET Version: 2.0.50727.1433
```

(Bug #46375)

- When populating a MySQL database table in Visual Studio using the Table Editor, if a `VARCHAR(10)` column was changed to a `VARCHAR(20)` column an exception was generated:

```
SystemArgumentException: DataGridViewComboBoxCell value is not valid.
To replace this default dialog please handle the DataError Event.
```

(Bug #46100)

- The MySQL Connector/Net 6.0.4 installer failed with an error. The error message generated was:

```
There is a problem with this Windows Installer package. A DLL required for this
install to complete could not be run. Contact your support personnel or package vendor.
```

When OK was clicked to acknowledge the error the installer exited. (Bug #45474)

- When using MySQL Connector/Net 6.0.4 and a MySQL Server 4.1 an exception was generated when trying to execute:

```
connection.GetSchema("Columns", ...);
```

The exception generated was:

```
'connection.GetSchema("Columns")' threw an exception of type
'System.ArgumentException'System.Data.DataTable {System.ArgumentException}
base{"Input string was not in a correct format.Couldn't store <'Select'> in
NUMERIC_PRECISION Column.  Expected type is UInt64."}System.Exception
{System.ArgumentException}
```

(Bug #46270)

- The MySQL Connector/Net method `StoredProcedure.GetParameters(string)` ignored the programmer's setting of the `UseProcedureBodies` option. This broke any application for which the application's parameter names did not match the parameter names in the Stored Procedure, resulting in an `ArgumentException` with the message “Parameter 'foo' not found in the collection.” and the following stack trace:

```
MySql.Data.dll!MySql.Data.MySqlClient.MySqlParameterCollection.GetParameterFlexible(stri
ng parameterName = "pStart", bool throwOnNotFound = true) Line 459C#

0x5f bytes
```

(Bug #46213)

- Errors occurred when using the Entity Framework with cultures that used a comma as the decimal separator. This was because the formatting for `SINGLE`, `DOUBLE` and `DECIMAL` values was not handled correctly. (Bug #44455)
- When reading data, such as with a `MySqlDataAdapter` on a `MySqlConnection`, MySQL Connector/Net could potentially enter an infinite loop in `CompressedStream.ReadNextpacket()` if compression was enabled. (Bug #43678)
- When attempting to connect to MySQL using the Compact Framework version of MySQL Connector/Net, an `IndexOutOfRangeException` exception was generated on trying to open the connection. (Bug #43736)
- In the case of long network inactivity, especially when connection pooling was used, connections were sometimes dropped, for example, by firewalls.

  Note: The bugfix introduced a new `keepalive` parameter, which prevents disconnects by sending an empty TCP packet after a specified timeout. (Bug #40684)
- MySQL Connector/Net CHM documentation stated that MySQL Server 3.23 was supported. (Bug #42110)
- An error occurred when building MySQL Connector/Net from source code checked out from the public SVN repository. This happened on Linux using Mono and Nant. The Mono JIT compiler version was 1.2.6.0. The Nant version was 0.85.

  When an attempt was made to build (for example) the MySQL Connector/Net 5.2 branch using the command:

  ```
  $ nant -buildfile:Client.build
  ```

  The following error occurred:

  ```
  BUILD FAILED

  Error loading buildfile.
  Encoding name 'Windows-1252' not supported.
  Parameter name: name
  ```

  (Bug #42411)
- Calling a Stored Procedure with an output parameter through MySQL Connector/Net resulted in a memory leak. Calling the same Stored Procedure without an output parameter did not result in a memory leak. (Bug #36027)

Changes in MySQL Connector/Net 6.1.0 (2009-07-15, alpha)

This is the first Alpha release of 6.1.

Functionality Added or Changed

- Website Configuration Dialog - This is a new wizard that is activated by clicking a button on the toolbar at the top of the Visual Studio Solution Explorer. It works in conjunction with the ASP.Net administration pages, making it easier to activate and set advanced options for the different MySQL web providers included.

- Session State Provider - This enables you to store the state of your website in a MySQL server.
- Support for native output parameters - This is supported when connected to a server that supports native output parameters. This includes servers as of 5.5.3 and 6.0.8.
- Changed GUID type - The backend representation of a guid type has been changed to be CHAR(36). This is so you can use the server UUID() function to populate a GUID table. UUID generates a 36 character string. Developers of older applications can add `old guids=true` to the connection string and the old BINARY(16) type will be used instead.

Changes in MySQL Connector/Net Version 6.0.x

Changes in MySQL Connector/Net 6.0.8 (Not released)

Fixes bugs since 6.0.7.

Version 6.0.8 has no changelog entries.

Changes in MySQL Connector/Net 6.0.7 (2010-08-30)

Fixes bugs since 6.0.6.

Bugs Fixed

- Attempting to read `Double.MinValue` from a `DOUBLE` column in MySQL table generated the following exception:

```
System.OverflowException : Value was either too large or too small for a Double.

--OverflowException
at System.Number.ParseDouble(String value, NumberStyles options, NumberFormatInfo
numfmt)
at MySql.Data.Types.MySqlDouble.MySql.Data.Types.IMySqlValue.ReadValue(MySqlPacket
packet, Int64 length, Boolean nullVal)
at MySql.Data.MySqlClient.NativeDriver.ReadColumnValue(Int32 index, MySqlField field,
IMySqlValue valObject)
at MySql.Data.MySqlClient.ResultSet.ReadColumnData(Boolean outputParms)
at MySql.Data.MySqlClient.ResultSet.NextRow(CommandBehavior behavior)
at MySql.Data.MySqlClient.MySqlDataReader.Read()
```

  (Bug #55644)

- `MySqlDataAdapter.Update()` generated concurrency violations for custom stored procedure driven update commands that used `UpdateRowSource.FirstReturnedRecord`. (Bug #54895)
- Several calls to `DataAdapter.Update()` with intervening changes to `DataTable` resulted in `ConcurrencyException` exceptions being generated. (Bug #54863)
- If `MySqlDataAdapter` was used with an `INSERT` command where the `VALUES` clause contained an expression with parentheses in it, and set the `adapter.UpdateBatchSize` parameter to be greater than one, then the call to `adapter.Update` either generated an exception or failed to batch the commands, executing each insert individually. (Bug #54386)
- The `MySqlHelper` object did not have an overloaded version of the `ExecuteReader` method that accepted a `MySqlConnection` object. (Bug #54570)
- Garbage Collector disposal of a `MySqlConnection` object caused the following exception:

```
System.IO.EndOfStreamException: Attempted to read past the end of the stream.
MySql.Data.MySqlClient.MySqlStream.ReadFully(Stream stream, Byte[] buffer, Int32 offset,
Int32 count)
MySql.Data.MySqlClient.MySqlStream.LoadPacket()
Outer Exception Reading from the stream has failed.
...
```

  (Bug #53457)

- After a timeout exception, if an attempt was made to reuse a connection returned to the connection pool the following exception was generated:

```
[MySqlException (0x80004005): There is already an open DataReader associated with this
Connection which must be closed first.]
   MySql.Data.MySqlClient.MySqlCommand.CheckState() +278
   MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior) +43
   MySql.Data.MySqlClient.MySqlCommand.ExecuteReader() +6
   Controls.SimpleCommand.ExecuteReader(String SQL) in ...:323
   Albums.GetImagesByAlbum(SimpleCommand Cmd, Int32 iAlbum, String Order, String Limit)
in ...:13
   Forecast.Page_Load(Object sender, EventArgs e) in ...:70
   System.Web.UI.Control.OnLoad(EventArgs e) +99
   System.Web.UI.Control.LoadRecursive() +50
   System.Web.UI.Page.ProcessRequestMain(Boolean includeStagesBeforeAsyncPoint, Boolean
includeStagesAfterAsyncPoint) +627
```

  (Bug #53357)

- The method `MySql.Data.Common.QueryNormalizer.CollapseValueList` generated an `ArgumentOutOfRangeException`. (Bug #54152, Bug #53865)

- In the ADO.NET Entity Data Model Wizard, the time to update a model scaled abnormally as the number of entities increased. (Bug #48791, Bug #12596237)

- Stored procedure enumeration code generated an error if a procedure was used in a dataset that did not return any resultsets. (Bug #50671)

- EventLog was not disposed in the SessionState provider. (Bug #52550)

- The `INSERT` command was significantly slower with MySQL Connector/Net 6.x compared to 5.x, when compression was enabled. (Bug #48243)

- Membership schema creation failed if the default schema collation was not Latin1. (Bug #53174)

- When an application was subjected to increased concurrent load, MySQL Connector/Net generated the following error when calling stored procedures:

```
A DataTable named \'Procedure Parameters\'
already belongs to this DataSet.
```

  (Bug #49118)

- When the connection string option “Connection Reset = True” was used, a connection reset used the previously used encoding for the subsequent authentication operation. This failed, for example, if UCS2 was used to read the last column before the reset. (Bug #47153)

- Opening a connection in the Visual Studio Server Explorer and choosing to alter an existing routine required another authentication at the server. (Bug #44715)

- When batching was used in `MySqlDataAdapter`, a connection was not opened automatically in `MySqlDataAdapter.Update()`. This resulted in an `InvalidOperationException` exception being generated, with the message text “connection must be valid and open”.

  MySQL Connector/Net has been changed to behave more like SQL Server: if the connection is closed, it is opened for the duration of update operation. (Bug #38411)

- Database name was emitted into typed datasets. This prevented users using the configured default database. (Bug #33870)

Changes in MySQL Connector/Net 6.0.6 (2010-04-28)

Fixes bugs since 6.0.5.

Functionality Added or Changed

- Procedure caching had a problem whereby if you created a procedure, dropped it, and recreated it with a different number of parameters an exception was generated.

  MySQL Connector/Net has been changed so that if the procedure is recreated with a different number of parameters, it will still be recognized. (Bug #52562)

- MySQL Connector/Net has been changed to include `MySqlDataReader.GetFieldType(string columnname)`. Further, `MySqlDataReader.GetOrdinal()` now includes the name of the column in the exception if the column is not found. (Bug #47467)

Bugs Fixed

- If using MySQL Server 5.0.x it was not possible to alter stored routines in Visual Studio. If the stored routine was clicked, and the context sensitive menu option, Alter Routine, selected, the following error was generated:

  ```
  Unable to load object with error: Object reference not
  set to an instance of an object
  ```

  (Bug #55170)

- In MySQL Connector/Net, the `MySqlConnection.Abort()` method contained a `try...catch` construct, with an empty `catch` block. This meant that any exception generated at this point would not be caught. (Bug #52769)

- If `FunctionsReturnString=true` was used in the connection string, the decimal separator (according to locale) was not interpreted. (Bug #52187)

- In MySQL Connector/Net, the `LoadCharsetMap()` function of the `CharSetMap` class set the following incorrect mapping:

  ```
  mapping.Add("latin1", new CharacterSet("latin1", 1));
  ```

  This meant that, for example, the Euro sign was not handled correctly.

  The correct mapping should have been:

  ```
  mapping.Add("latin1", new CharacterSet("windows-1252", 1));
  ```

  This is because MySQL's `latin1` character set is the same as the `windows-cp1252` character set and it extends the official ISO 8859-1 or IANA latin1. (Bug #51927)

- A non-terminated string in SQL threw a CLR exception rather than a syntax exception. (Bug #51788)

- When using table per type inheritance and listing the contents of the parent table, the result of the query was a list of child objects, even though there was no related child record with the same parent Id. (Bug #49850)

- When calling `ExecuteNonQuery` on a command object, the following exception occurred:

  ```
  Index and length must refer to a location within the string.
  Parameter name: length
  ```

  (Bug #51610)

- Binary Columns were not displayed in the Query Builder of Visual Studio. (Bug #50171)

- `MySqlCommand.Parameters.Clear()` did not work. (Bug #50444)

- When the `UpdateBatchSize` property was set to a value greater than 1, only the first row was applied to the database. (Bug #50123)

- The method `Command.TrimSemicolons` used `StringBuilder`, and therefore allocated memory for the query even if it did not need to be trimmed. This led to excessive memory consumption when executing a number of large queries. (Bug #51149)

- When the `MySqlScript.execute()` method was called, the following exception was generated:

```
InvalidOperationException : The CommandText property has not been properly initialized.
```

  (Bug #50344)

- A `FormatException` was generated when an empty string was returned from a stored function. (Bug #49642)

- `MySqlDataReader.GetUInt64` returned an incorrect value when reading a `BIGINT UNSIGNED` column containing a value greater than 2147483647. (Bug #49794)

- Calling a User Defined Function using Entity SQL in the Entity Framework caused a `NullReferenceException`. (Bug #45277)

- The method `MySqlDataReader.GetSchemaTable()` returned 0 in the `NumericPrecision` field for decimal and newdecimal columns. (Bug #48171)

- Attempting to execute a load data local infile on a file where the user did not have write permissions, or the file was open in an editor gave an access denied error. (Bug #48944)

- When adding a data set in Visual Studio 2008, the following error was generated:

```
Relations couldn't be added. Column 'REFERENCED_TABLE_CATALOG' does not belong to table.
```

  This was due to a 'REFERENCED_TABLE_CATALOG' column not being included in the foreign keys collection. (Bug #48974)

- When trying to create stored procedures from an SQL script, a `MySqlException` was thrown when attempting to redefine the `DELIMITER`:

```
MySql.Data.MySqlClient.MySqlException was unhandled
Message="You have an error in your SQL syntax; check the manual that corresponds to your
MySQL server version for the right syntax to use near 'DELIMITER' at line 1"
Source="MySql.Data"
ErrorCode=-2147467259
Number=1064
StackTrace:
à MySql.Data.MySqlClient.MySqlStream.ReadPacket()
à MySql.Data.MySqlClient.NativeDriver.ReadResult(UInt64& affectedRows, Int64&
lastInsertId)
à MySql.Data.MySqlClient.MySqlDataReader.GetResultSet()
à MySql.Data.MySqlClient.MySqlDataReader.NextResult()
à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior behavior)
à MySql.Data.MySqlClient.MySqlCommand.ExecuteReader()
à MySql.Data.MySqlClient.MySqlCommand.ExecuteNonQuery()
à MySql.Data.MySqlClient.MySqlScript.Execute()
```

  Note: The `MySqlScript` class has been fixed to support the delimiter statement as it is found in SQL scripts. (Bug #46429)

- A connection string set in `web.config` could not be reused after Visual Studio 2008 Professional was shut down. It continued working for the existing controls, but did not work for new controls added. (Bug #41629)

Changes in MySQL Connector/Net 6.0.5 (2009-11-12)

This is a new release, fixing recently discovered bugs.

Bugs Fixed

- Cloning of `MySqlCommand` was not typesafe. To clone a `MySqlCommand` it was necessary to do:

```
MySqlCommand clone = (MySqlCommand)((ICloneable)comm).Clone();
```

  MySQL Connector/Net was changed so that it was possible to do:

```
MySqlCommand clone = comm.Clone();
```

(Bug #48460)

- An entity model created from a schema containing a table with a column of type `UNSIGNED BIGINT` and a view of the table did not behave correctly. When an entity was created and mapped to the view, the column that was of type `UNSIGNED BIGINT` was displayed as `BIGINT`. (Bug #47872)
- It was not possible to retrieve a value from a MySQL server table, if the value was larger than that supported by the .NET type `System.Decimal`.

  MySQL Connector/Net was changed to expose the `MySqlDecimal` type, along with the supporting method `GetMySqlDecimal`. (Bug #48100)
- If `MySqlConnection.GetSchema` was called for "Indexes" on a table named “b`a`d” as follows:

  ```
  DataTable schemaPrimaryKeys = connection.GetSchema(
    "Indexes",
    new string[] { null, schemaName, "b`a`d"});
  ```

  Then the following exception was generated:

  ```
  You have an error in your SQL syntax; check the manual that corresponds to
  your MySQL server version for the right syntax to use near 'a`d`' at line 1
  ```

  (Bug #48101)
- When loading the `MySQLClient-mono.sln` file included with the Connector/Net source into Mono Develop, the following error occurred:

  ```
  /home/tbedford/connector-net-src/6.1/MySQLClient-mono.sln(22):
  Unsupported or unrecognized project:
  '/home/tbedford/connector-net-src/6.1/Installer/Installer.wixproj'
  ```

  If the file was modified to remove this problem, then attempting to build the solution generated the following error:

  ```
  /home/tbedford/connector-net-src/6.1/MySql.Data/Provider/Source/Connection.cs(280,46):
  error CS0115: `MySql.Data.MySqlClient.MySqlConnection.DbProviderFactory' is marked as an
  override but no suitable property found to override
  ```

  (Bug #47048)
- If an error occurred during connection to a MySQL Server, deserializing the error message from the packet buffer caused a `NullReferenceException` to be thrown. When the method `MySqlPacket::ReadString()` attempted to retrieve the error message, the following line of code threw the exception:

  ```
  string s = encoding.GetString(bits, (int)buffer.Position, end - (int)buffer.Position);
  ```

  This was due to the fact that the encoding field had not been initialized correctly. (Bug #46844)
- In the `MySqlDataReader` class the `GetSByte` function returned a `byte` value instead of an `sbyte` value. (Bug #46620)
- An exception was generated when using `TIMESTAMP` columns with the Entity Framework. (Bug #46311)
- Insert into two tables failed when using the Entity Framework. The exception generated was:

  ```
  The value given is not an instance of type 'Edm.Int32'
  ```

  (Bug #45077)
- Conversion of MySQL `TINYINT(1)` to `boolean` failed. (Bug #46205, Bug #46359, Bug #41953)

- Calling the Entity Framework `SaveChanges()` method of any MySQL ORM Entity with a column type `TIME`, generated an error message:

```
Unknown PrimitiveKind Time
```

  (Bug #45457)

- The Entity Framework provider was not calling `DBSortExpression` correctly when the `Skip` and `Take` methods were used, such as in the following statement:

```
TestModel.tblquarantine.OrderByDescending(q => q.MsgDate).Skip(100).Take(100).ToList();
```

  This resulted in the data being unsorted. (Bug #45723)

- MySQL Connector/Net sometimes hung, without generating an exception. This happened if a read from a stream failed returning a 0, causing the code in `LoadPacket()` to enter an infinite loop. (Bug #46308)

- The MySQL Connector/Net Profile Provider, `MySql.Web.Profile.MySQLProfileProvider`, generated an error when running on Mono. When an attempt was made to save a string in `Profile.Name` the string was not saved to the `my_aspnet_Profiles` table. If an attempt was made to force the save with `Profile.Save()` the following error was generated:

```
Server Error in '/mono' Application

--------------------------------------------------------------------------------

The requested feature is not implemented.
Description: HTTP 500. Error processing request.

Stack Trace:

System.NotImplementedException: The requested feature is not implemented.

(System.Configuration.SettingsContext context,
System.Configuration.SettingsPropertyValueCollection collection) [0x00000]

--------------------------------------------------------------------------------
Version information: Mono Version: 2.0.50727.1433; ASP.NET Version: 2.0.50727.1433
```

  (Bug #46375)

- When populating a MySQL database table in Visual Studio using the Table Editor, if a `VARCHAR(10)` column was changed to a `VARCHAR(20)` column an exception was generated:

```
SystemArgumentException: DataGridViewComboBoxCell value is not valid.
To replace this default dialog please handle the DataError Event.
```

  (Bug #46100)

- The MySQL Connector/Net 6.0.4 installer failed with an error. The error message generated was:

```
There is a problem with this Windows Installer package. A DLL required for this
install to complete could not be run. Contact your support personnel or package vendor.
```

  When OK was clicked to acknowledge the error the installer exited. (Bug #45474)

- When using MySQL Connector/Net 6.0.4 and a MySQL Server 4.1 an exception was generated when trying to execute:

```
connection.GetSchema("Columns", ...);
```

  The exception generated was:

```
'connection.GetSchema("Columns")' threw an exception of type
'System.ArgumentException'System.Data.DataTable {System.ArgumentException}
base{"Input string was not in a correct format.Couldn't store <'Select'> in
NUMERIC_PRECISION Column.  Expected type is UInt64."}System.Exception
{System.ArgumentException}
```

(Bug #46270)

- The MySQL Connector/Net method `StoredProcedure.GetParameters(string)` ignored the programmer's setting of the `UseProcedureBodies` option. This broke any application for which the application's parameter names did not match the parameter names in the Stored Procedure, resulting in an `ArgumentException` with the message “Parameter 'foo' not found in the collection.” and the following stack trace:

```
MySql.Data.dll!MySql.Data.MySqlClient.MySqlParameterCollection.GetParameterFlexible(stri
ng parameterName = "pStart", bool throwOnNotFound = true) Line 459C#

System.Data.dll!System.Data.Common.DbDataAdapter.Fill(System.Data.DataSet dataSet) +
0x5f bytes
```

(Bug #46213)

- The `EscapeString` code carried out escaping by calling `string.Replace` multiple times. This resulted in a performance bottleneck, as for every line a new string was allocated and another was disposed of by the garbage collector. (Bug #45699)

- In MySQL Connector/Net 6.0.4 using `GetProcData` generated an error because the `parameters` data table was only created if MySQL Server was at least version 6.0.6, or if the `UseProcedureBodies` connection string option was set to true.

  Also the `DeriveParameters` command generated a null reference exception. This was because the `parameters` data table, which was null, was used in a `for each` loop. (Bug #45952)

- Adding the `Allow Batch=False` option to the connection string caused MySQL Connector/Net to generate the error:

```
You have an error in your SQL syntax; check the manual that corresponds to your MySQL
server version for the right syntax to use near 'SET character_set_results=NULL' at line 1
```

(Bug #45502)

- A MySQL Connector/Net test program that connected to MySQL Server using the connection string option `compress=true` crashed, but only when running on Mono. The program worked as expected when running on Microsoft Windows.

  This was due to a bug in Mono. MySQL Connector/Net was modified to avoid using `WeakReferences` in the `Compressed` stream class, which was causing the crash. (Bug #45463)

- Input parameters were missing from Stored Procedures when using them with ADO.NET Data Entities. (Bug #44985)

- Errors occurred when using the Entity Framework with cultures that used a comma as the decimal separator. This was because the formatting for `SINGLE`, `DOUBLE` and `DECIMAL` values was not handled correctly. (Bug #44455)
- When reading data, such as with a `MySqlDataAdapter` on a `MySqlConnection`, MySQL Connector/Net could potentially enter an infinite loop in `CompressedStream.ReadNextpacket()` if compression was enabled. (Bug #43678)
- When attempting to connect to MySQL using the Compact Framework version of MySQL Connector/Net, an `IndexOutOfRangeException` exception was generated on trying to open the connection. (Bug #43736)
- In the case of long network inactivity, especially when connection pooling was used, connections were sometimes dropped, for example, by firewalls.

  Note: The bugfix introduced a new `keepalive` parameter, which prevents disconnects by sending an empty TCP packet after a specified timeout. (Bug #40684)
- MySQL Connector/Net CHM documentation stated that MySQL Server 3.23 was supported. (Bug #42110)
- An error occurred when building MySQL Connector/Net from source code checked out from the public SVN repository. This happened on Linux using Mono and Nant. The Mono JIT compiler version was 1.2.6.0. The Nant version was 0.85.

  When an attempt was made to build (for example) the MySQL Connector/Net 5.2 branch using the command:

  ```
  $ nant -buildfile:Client.build
  ```

  The following error occurred:

  ```
  BUILD FAILED

  Error loading buildfile.
  Encoding name 'Windows-1252' not supported.
  Parameter name: name
  ```

  (Bug #42411)
- MySQL Connector/Net generated the following exception:

  ```
  System.NullReferenceException: Object reference not set to an instance of an object.
        bei MySql.Data.MySqlClient.MySqlCommand.TimeoutExpired(Object commandObject)
        bei System.Threading._TimerCallback.TimerCallback_Context(Object state)
        bei System.Threading.ExecutionContext.runTryCode(Object userData)
        bei
        System.Runtime.CompilerServices.RuntimeHelpers.ExecuteCodeWithGuaranteedCleanup(TryCode
        code, CleanupCode backoutCode, Object userData)
        bei System.Threading.ExecutionContext.RunInternal(ExecutionContext executionContext,
        ContextCallback callback, Object state)
        bei System.Threading.ExecutionContext.Run(ExecutionContext executionContext,
        ContextCallback callback, Object state)
        bei System.Threading._TimerCallback.PerformTimerCallback(Object state)
  ```

  (Bug #40005)
- After a Reference to "C:\Program Files\MySQL\MySQL Connector Net 5.2.4\Compact Framework \MySql.Data.CF.dll" was added to a Windows Mobile 5.0 project, the project then failed to build, generating a Microsoft Visual C# compiler error.

  The error generated was:

  ```
  Error 2 The type 'System.Runtime.CompilerServices.CompilerGeneratedAttribute'
  has no constructors defined MysqlTest
  Error 3 Internal Compiler Error (0xc0000005 at address 5A7E3714):
  ```

```
likely culprit is 'COMPILE'.
```

(Bug #42261)

- Using a `DataAdapter` with a linked `MySqlCommandBuilder` the following exception was thrown when trying to call `da.Update(DataRow[] rows)`:

```
Connection must be valid and open
```

(Bug #34657)

- Calling a Stored Procedure with an output parameter through MySQL Connector/Net resulted in a memory leak. Calling the same Stored Procedure without an output parameter did not result in a memory leak. (Bug #36027)

Changes in MySQL Connector/Net 6.0.4 (2009-06-16)

This is the first post-GA release, fixing recently discovered bugs.

Bugs Fixed

- If a certain socket exception occurred when trying to establish a MySQL database connection, MySQL Connector/Net displayed an exception message that appeared to be unrelated to the underlying problem. This masked the problem and made diagnosing problems more difficult.

  For example, if, when establishing a database connection using TCP/IP, Windows on the local machine allocated an ephemeral port that conflicted with a socket address still in use, then Windows/.NET would throw a socket exception with the following error text:

```
Only one usage of each socket address (protocol/network address/port) is normally
permitted IP ADDRESS/PORT.
```

  However, MySQL Connector/Net masked this socket exception and displayed an exception with the following text:

```
Unable to connect to any of the specified MySQL hosts.
```

  (Bug #45021)

- The Data Set editor generated an error when attempts were made to modify insert, update or delete commands:

```
Error in WHERE clause near '@'.
Unable to parse query text.
```

  (Bug #44512)

- MySQL Connector/Net was missing the capability to validate the server's certificate when using encryption. This made it possible to conduct a man-in-the-middle attack against the connection, which defeated the security provided by SSL. (Bug #38700)

- A SQL query string containing an escaped backslash caused an exception to be generated:

```
Index and length must refer to a location within the string.
Parameter name: length
at System.String.InternalSubStringWithChecks(Int32 startIndex, Int32 length, Boolean
fAlwaysCopy)
at MySql.Data.MySqlClient.MySqlTokenizer.NextParameter()
at MySql.Data.MySqlClient.Statement.InternalBindParameters(String sql,
MySqlParameterCollection parameters, MySqlPacket packet)
at MySql.Data.MySqlClient.Statement.BindParameters()
at MySql.Data.MySqlClient.PreparableStatement.Execute()
at MySql.Data.MySqlClient.MySqlCommand.ExecuteReader(CommandBehavior be#havior)
at MySql.Data.MySqlClient.MySqlCommand.ExecuteNonQuery()
```

  (Bug #44960)

- The Microsoft Visual Studio solution file `MySQL-VS2005.sln` was invalid. Several projects could not be loaded and thus it was not possible to build MySQL Connector/Net from source. (Bug #44822)
- When creating a new DataSet the following error was generated:

```
Failed to open a connection to database.
Cannot load type with name 'MySQL.Data.VisualStudio.StoredProcedureColumnEnumerator'
```

  (Bug #44460)
- The DataReader in MySQL Connector/Net 6.0.3 considered a BINARY(16) field as a GUID with a length of 16. (Bug #44507)
- The MySQL Connector/Net MySQLRoleProvider reported that there were no roles, even when roles existed. (Bug #44414)

Changes in MySQL Connector/Net 6.0.3 (2009-04-28)

First GA release.

Functionality Added or Changed

- The `MySqlTokenizer` failed to split fieldnames from values if they were not separated by a space. This also happened if the string contained certain characters. As a result `MySqlCommand.ExecuteNonQuery` raised an index out of range exception.

  The resulting errors are illustrated by the following examples. Note, the example statements do not have delimiting spaces around the `=` operator.

```
INSERT INTO anytable SET Text='test--test';
```

  The tokenizer incorrectly interpreted the value as containing a comment.

```
UPDATE anytable SET Project='123-456',Text='Can you explain this ?',Duration=15 WHERE
      ID=4711;'
```

  A `MySqlException` was generated, as the `?` in the value was interpreted by the tokenizer as a parameter sign. The error message generated was:

```
Fatal error encountered during command execution.
EXCEPTION: MySqlException - Parameter '?'' must be defined.
```

  (Bug #44318)

Bugs Fixed

- Column types for `SchemaProvider` and `ISSchemaProvider` did not match.

  When the source code in `SchemaProvider.cs` and `ISSchemaProvider.cs` were compared it was apparent that they were not using the same column types. The base provider used SQL such as `SHOW CREATE TABLE`, while `ISSchemaProvider` used the schema information tables. Column types used by the base class were `INT64` and the column types used by `ISSchemaProvider` were `UNSIGNED`. (Bug #44123)
- `MySQL.Data` was not displayed as a Reference inside Microsoft Visual Studio 2008 Professional.

  When a new C# project was created in Microsoft Visual Studio 2008 Professional, `MySQL.Data` was not displayed when References, Add Reference was selected. (Bug #44141)

Changes in MySQL Connector/Net 6.0.2 (2009-04-07, beta)

This is a new development release, fixing recently discovered bugs.

Bugs Fixed

- MySQL Connector/Net 6.0.1 did not load in Microsoft Visual Studio 2008 and Visual Studio 2005 Pro.

  The following error message was generated:

  ```
  .NET Framework Data Provider for MySQL: The data provider object factory service was not
  found.
  ```

  (Bug #44064)

Changes in MySQL Connector/Net 6.0.1 (2009-04-02, beta)

This is a new Beta development release, fixing recently discovered bugs.

Bugs Fixed

- Generating an Entity Data Model (EDM) schema with a table containing columns with data types `MEDIUMTEXT` and `LONGTEXT` generated a runtime error message “Max value too long or too short for Int32”. (Bug #43480)
- An insert and update error was generated by the decimal data type in the Entity Framework, when a German collation was used. (Bug #43574)

Changes in MySQL Connector/Net 6.0.0 (2009-03-02, alpha)

This is a new Alpha development release.

Bugs Fixed

- A null reference exception was generated when `MySqlConnection.ClearPool(connection)` was called. (Bug #42801)

Changes in MySQL Connector/Net Version 5.3.x

Changes in MySQL Connector/Net 5.3.0 (Not released)

Version 5.3.0 has no changelog entries.

Changes in MySQL Connector/Net Version 5.2.x

Changes in MySQL Connector/Net 5.2.8 (Not released)

Version 5.2.8 has no changelog entries.

Changes in MySQL Connector/Net 5.2.7 (2009-07-15)

Bugs Fixed

- The `EscapeString` code carried out escaping by calling `string.Replace` multiple times. This resulted in a performance bottleneck, as for every line a new string was allocated and another was disposed of by the garbage collector. (Bug #45699)
- A MySQL Connector/Net test program that connected to MySQL Server using the connection string option `compress=true` crashed, but only when running on Mono. The program worked as expected when running on Microsoft Windows.

  This was due to a bug in Mono. MySQL Connector/Net was modified to avoid using `WeakReferences` in the `Compressed` stream class, which was causing the crash. (Bug #45463)
- MySQL Connector/Net generated the following exception:

  ```
  System.NullReferenceException: Object reference not set to an instance of an object.
        bei MySql.Data.MySqlClient.MySqlCommand.TimeoutExpired(Object commandObject)
        bei System.Threading._TimerCallback.TimerCallback_Context(Object state)
        bei System.Threading.ExecutionContext.runTryCode(Object userData)
  ```

```
      bei
      System.Runtime.CompilerServices.RuntimeHelpers.ExecuteCodeWithGuaranteedCleanup(TryCode
      code, CleanupCode backoutCode, Object userData)
      bei System.Threading.ExecutionContext.RunInternal(ExecutionContext executionContext,
      ContextCallback callback, Object state)
      bei System.Threading.ExecutionContext.Run(ExecutionContext executionContext,
      ContextCallback callback, Object state)
      bei System.Threading._TimerCallback.PerformTimerCallback(Object state)
```

(Bug #40005)

- After a Reference to "C:\Program Files\MySQL\MySQL Connector Net 5.2.4\Compact Framework \MySql.Data.CF.dll" was added to a Windows Mobile 5.0 project, the project then failed to build, generating a Microsoft Visual C# compiler error.

  The error generated was:

  ```
  Error 2 The type 'System.Runtime.CompilerServices.CompilerGeneratedAttribute'
  has no constructors defined MysqlTest
  Error 3 Internal Compiler Error (0xc0000005 at address 5A7E3714):
  likely culprit is 'COMPILE'.
  ```

  (Bug #42261)

- If a certain socket exception occurred when trying to establish a MySQL database connection, MySQL Connector/Net displayed an exception message that appeared to be unrelated to the underlying problem. This masked the problem and made diagnosing problems more difficult.

  For example, if, when establishing a database connection using TCP/IP, Windows on the local machine allocated an ephemeral port that conflicted with a socket address still in use, then Windows/.NET would throw a socket exception with the following error text:

  ```
  Only one usage of each socket address (protocol/network address/port) is normally
  permitted IP ADDRESS/PORT.
  ```

  However, MySQL Connector/Net masked this socket exception and displayed an exception with the following text:

  ```
  Unable to connect to any of the specified MySQL hosts.
  ```

  (Bug #45021)

- The Microsoft Visual Studio solution file `MySQL-VS2005.sln` was invalid. Several projects could not be loaded and thus it was not possible to build MySQL Connector/Net from source. (Bug #44822)

- The MySQL Connector/Net MySQLRoleProvider reported that there were no roles, even when roles existed. (Bug #44414)

- When a TableAdapter was created on a DataSet, it was not possible to use a stored procedure with variables. The following error was generated:

  ```
  The method or operation is not implemented
  ```

  (Bug #39409)

Changes in MySQL Connector/Net 5.2.6 (2009-04-28)

Functionality Added or Changed

- A new connection string option has been added: `use affected rows`. When `true` the connection will report changed rows instead of found rows. (Bug #44194)

Bugs Fixed

- Calling `GetSchema()` on `Indexes` or `IndexColumns` failed where index or column names were restricted.

In `SchemaProvider.cs`, methods `GetIndexes()` and `GetIndexColumns()` passed their restrictions directly to `GetTables()`. This only worked if the restrictions were no more specific than `schemaName` and `tableName`. If `IndexName` was given, this was passed to `GetTables()` where it was treated as `TableType`. As a result no tables were returned, unless the index name happened to be `BASE TABLE` or `VIEW`. This meant that both methods failed to return any rows. (Bug #43991)

- `GetSchema("MetaDataCollections")` should have returned a table with a column named “NumberOfRestrictions” not “NumberOfRestriction”.

  This can be confirmed by referencing the Microsoft Documentation. (Bug #43990)

- Requests sent to the MySQL Connector/Net role provider to remove a user from a role failed. The query log showed the query was correctly executed within a transaction which was immediately rolled back. The rollback was caused by a missing call to the `Complete` method of the transaction. (Bug #43553)

- A null reference exception was generated when `MySqlConnection.ClearPool(connection)` was called. (Bug #42801)

- The `GetGuid()` method of `MySqlDataReader` did not treat `BINARY(16)` column data as a GUID. When operating on such a column a `FormatException` exception was generated. (Bug #41452)

- When using `MySqlBulkLoader.Load()`, the text file is opened by `NativeDriver.SendFileToServer`. If it encountered a problem opening the file as a stream, an exception was generated and caught. An attempt to clean up resources was then made in the `finally{}` clause by calling `fs.Close()`, but since the stream was never successfully opened, this was an attempt to execute a method of a null reference. (Bug #43332)

- `MySQLMembershipProvider.ValidateUser` only used the `userId` to validate. However, it should also use the `applicationId` to perform the validation correctly.

  The generated query was, for example:

  ```
  SELECT Password, PasswordKey, PasswordFormat, IsApproved, Islockedout
        FROM my_aspnet_Membership WHERE userId=13
  ```

  Note that `applicationId` is not used. (Bug #42574)

- When ASP.NET membership was configured to not require password question and answer using `requiresQuestionAndAnswer="false"`, a `SqlNullValueException` was generated when using `MembershipUser.ResetPassword()` to reset the user password. (Bug #41408)

- There was an error in the `ProfileProvider` class in the `private ProfileInfoCollection GetProfiles()` function. The column of the final table was named “lastUpdatdDate” ('e' is missing) instead of the correct “lastUpdatedDate”. (Bug #41654)

- When `MySql.Web.Profile.MySQLProfileProvider` was configured, it was not possible to assign a name other than the default name `MySQLProfileProvider`.

  If the name `SCC_MySQLProfileProvider` was assigned, an exception was generated when attempting to use `Page.Context.Profile['custom prop']`.

  The exception generated was:

  ```
  The profile default provider was not found.
  ```

  Note that the exception stated: 'the profile **default provider**...', even though a different name was explicitly requested. (Bug #40871)

- If a `Stored Procedure` contained spaces in its parameter list, and was then called from MySQL Connector/Net, an exception was generated. However, the same `Stored Procedure` called from the MySQL Query Analyzer or the MySQL Client worked correctly.

The exception generated was:

```
Parameter '0' not found in the collection.
```

(Bug #41034)

- The `DATETIME` format contained an erroneous space. (Bug #41021)
- When `ExecuteNonQuery` was called with a command type of `Stored Procedure` it worked for one user but resulted in a hang for another user with the same database permissions.

  However, if `CALL` was used in the command text and `ExecuteNonQuery` was used with a command type of `Text`, the call worked for both users. (Bug #40139)

Changes in MySQL Connector/Net 5.2.5 (2008-11-19)

Bugs Fixed

- Visual Studio 2008 displayed the following error three times on start-up:

```
"Package Load Failure

Package 'MySql.Data.VisualStudio.MySqlDataProviderPackage, MySql.VisualStudio,
Version=5.2.4, Culture=neutral, PublicKeyToken=null' has failed to load properly (GUID =
{79A115C9-B133-4891-9E7B-242509DAD272}).  Please contact the package vendor for
assistance.  Application restart is recommended, due to possible environment corruption.
Would you like to disable loading the package in the future?  You may use
'devenve/resetskippkgs' to re-enable package loading."
```

(Bug #40726)

Changes in MySQL Connector/Net 5.2.4 (2008-11-13)

Bugs Fixed

- `MySqlDataReader` did not feature a `GetSByte` method. (Bug #40571)
- `GetDefaultCollation` and `GetMaxLength` were not thread safe. These functions called the database to get a set of parameters and cached them in two static dictionaries in the function `InitCollections`. However, if many threads called them they would try to insert the same keys in the collections resulting in duplicate key exceptions. (Bug #40231)
- The connection string option `Functions Return String` did not set the correct encoding for the result string. Even though the connection string option `Functions Return String=true;` is set, the result of `SELECT DES_DECRYPT()` contained “??” instead of the correct national character symbols. (Bug #40076)
- When working with stored procedures MySQL Connector/Net generated an exception `Unknown "table parameters" in information_schema`. (Bug #40382)
- If connection pooling was not set explicitly in the connection string, MySQL Connector/Net added “;Pooling=False” to the end of the connection string when `MySqlCommand.ExecuteReader()` was called.

  If connection pooling was explicitly set in the connection string, when `MySqlConnection.Open()` was called it converted “Pooling=True” to “pooling=True”.

  If `MySqlCommand.ExecuteReader()` was subsequently called, it concatenated “;Pooling=False” to the end of the connection string. The resulting connection string was thus terminated with “pooling=True;Pooling=False”. This disabled connection pooling completely. (Bug #40091)
- After the `ConnectionString` property was initialized using the public setter of `DbConnectionStringBuilder`, the `GetConnectionString` method of

`MySqlConnectionStringBuilder` incorrectly returned `null` when `true` was assigned to the `includePass` parameter. (Bug #39728)

- If, when using the `MySqlTransaction` transaction object, an exception was thrown, the transaction object was not disposed of and the transaction was not rolled back. (Bug #39817)
- When using `ProfileProvider`, attempting to update a previously saved property failed. (Bug #39330)
- Reading a negative time value greater than -01:00:00 returned the absolute value of the original time value. (Bug #39294)
- Inserting a negative time value (negative `TimeSpan`) into a `Time` column through the use of `MySqlParameter` caused `MySqlException` to be thrown. (Bug #39275)
- The Web Provider did not work at all on a remote host, and did not create a database when using `autogenerateschema="true"`. (Bug #39072)
- MySQL Connector/Net called hashed password methods not supported in Mono 2.0 Preview 2. (Bug #38895)
- When a data connection was created in the server explorer of Visual Studio 2008 Team, an error was generated when trying to expand stored procedures that had parameters.

  Also, if **TableAdapter** was right-clicked and then Add, Query, Use Existing Stored Procedures selected, if you then attempted to select a stored procedure, the window would close and no error message would be displayed. (Bug #39252)

Changes in MySQL Connector/Net 5.2.3 (2008-08-19)

Functionality Added or Changed

- Error string was returned after a 28000 second `wait_timeout` [538]. This has been changed to generate a `ConnectionState.Closed` event. (Bug #38119)
- String escaping functionality has been moved from the `MySqlString` class to the `MySqlHelper` class, where it can be accessed by the `EscapeString` method. (Bug #36205)
- Changed how the procedure schema collection is retrieved. If `use procedure bodies=true` then the `mysql.proc` table is selected directly as this is up to 50 times faster than the current `information_schema` implementation. If `use procedure bodies=false`, then the `information_schema` collection is queried. (Bug #36694)

Bugs Fixed

- MySQL Connector/Net uninstaller did not clean up all installed files. (Bug #38534)
- The `GetOrdinal()` method failed to return the ordinal if the column name string contained an accent. (Bug #38721)
- There was a short circuit evaluation error in the `MySqlCommand.CheckState()` method. When the statement `connection == null` was true a `NullReferenceException` was thrown and not the expected `InvalidOperationException`. (Bug #38276)
- The provider did not silently create the user if the user did not exist. (Bug #38243)
- Unnecessary network traffic was generated for the normal case where the web provider schema was up to date. (Bug #37469)
- Executing a command that resulted in a fatal exception did not close the connection. (Bug #37991)
- When a prepared insert query is run that contains an `UNSIGNED TINYINT` in the parameter list, the complete query and data that should be inserted is corrupted and no error is thrown. (Bug #37968)

- In a .NET application MySQL Connector/Net modifies the connection string so that it contains several occurrences of the same option with different values. This is illustrated by the example that follows.

  The original connection string:

  ```
  host=localhost;database=test;uid=*****;pwd=*****;
  connect timeout=25; auto enlist=false;pooling=false;
  ```

  The connection string after closing `MySqlDataReader`:

  ```
  host=localhost;database=test;uid=*****;pwd=*****;
  connect timeout=25;auto enlist=false;pooling=false;
  Allow User Variables=True;Allow User Variables=False;
  Allow User Variables=True;Allow User Variables=False;
  ```

  (Bug #37955)

- `MySqlReader.GetOrdinal()` performance enhancements break existing functionality. (Bug #37239)

- `GetSchema` did not work correctly when querying for a collection, if using a non-English locale. (Bug #35459)

- When reading back a stored double or single value using the .NET provider, the value had less precision than the one stored. (Bug #33322)

- The `autogenerateschema` option produced tables with incorrect collations. (Bug #36444)

- Using the MySQL Visual Studio plugin and a MySQL 4.1 server, certain field types (`ENUM`) would not be identified correctly. Also, when looking for tables, the plugin would list all tables matching a wildcard pattern of the database name supplied in the connection string, instead of only tables within the specified database. (Bug #30603)

Changes in MySQL Connector/Net 5.2.2 (2008-05-12)

Bugs Fixed

- Product documentation incorrectly stated '?' is the preferred parameter marker. (Bug #37349)

- There was a high level of contention in the connection pooling code that could lead to delays when opening connections and submitting queries. The connection pooling code has been modified to try and limit the effects of the contention issue. (Bug #34001)

- An incorrect value for a bit field would returned in a multi-row query if a preceding value for the field returned `NULL`. (Bug #36313)

- When using the `MySQLProfileProvider`, setting profile details and then reading back saved data would result in the default values being returned instead of the updated values. (Bug #36000)

- The `DbCommandBuilder.QuoteIdentifer` method was not implemented. (Bug #35492)

- Tables with `GEOMETRY` field types would return an unknown data type exception. (Bug #36081)

- When creating a connection, setting the `ConnectionString` property of `MySqlConnection` to `NULL` would throw an exception. (Bug #35619)

- When using encrypted passwords, the `GetPassword()` function would return the wrong string. (Bug #35336)

- An error would be raised when calling `GetPassword()` with a `NULL` value. (Bug #35332)

- When retrieving data where a field has been identified as containing a GUID value, the incorrect value would be returned when a previous row contained a `NULL` value for that field. (Bug #35041)

- When using `SqlDataSource` to open a connection, the connection would not automatically be closed when access had completed. (Bug #34460)
- Using the `TableAdapter` wizard in combination with a suitable `SELECT` statement, only the associated `INSERT` statement would also be created, rather than the required `DELETE` and `UPDATE` statements. (Bug #31338)
- When creating a new stored procedures, the new parameter code which permits the use of the `@` symbol would interfere with the specification of a `DEFINER`. (Bug #34940)
- Using the `TableAdapter Wizard` would fail when generating commands that used stored procedures due to the change in supported parameter characters. (Bug #34941)
- Fixed profile provider that would throw an exception if you were updating a profile that already existed.
- Fixed problem in datagrid code related to creating a new table. This problem may have been introduced with .NET 2.0 SP1.

Changes in MySQL Connector/Net 5.2.1 (2008-02-27)

Bugs Fixed

- A race condition could occur within the procedure cache resulting the cache contents overflowing beyond the configured cache size. (Bug #34338)
- When altering a stored procedure within Visual Studio, the parameters to the procedure could be lost. (Bug #34359)
- Attempting to use an isolation level other than the default with a transaction scope would use the default isolation level. (Bug #34448)
- A number of issues were identified in the case, connection and schema areas of the code for `MembershipProvider`, `RoleProvider`, `ProfileProvider`. (Bug #34495)
- When executing statements that used stored procedures and functions, the new parameter code could fail to identify the correct parameter format. (Bug #34699)
- When using web providers, the MySQL Connector/Net would check the schema and cache the application id, even when the connection string had been set. The effect would be to break the membership provider list. (Bug #34451)
- The installer would fail to the DDEX provider binary if the Visual Studio 2005 component was not selected. The result would lead to MySQL Connector/Net not loading properly when using the interface to a MySQL server within Visual Studio. (Bug #34674)
- When using the provider to generate or update users and passwords, the password checking algorithm would not validate the password strength or requirements correctly. (Bug #34792)
- The provider code has been updated to fix a number of outstanding issues.
- Fixed problem with Visual Studio 2008 integration that caused pop-up menus on server explorer nodes to not function

Changes in MySQL Connector/Net 5.2.0 (2008-02-11)

Functionality Added or Changed

- Performing `GetValue()` on a field `TINYINT(1)` returned a `BOOLEAN`. While not a bug, this caused problems in software that expected an `INT` to be returned. A new connection string option `Treat Tiny As Boolean` has been added with a default value of `true`. If set to `false` the provider will treat `TINYINT(1)` as `INT`. (Bug #34052)

- Added ClearPool and ClearAllPools features.
- DDEX provider now works under Visual Studio 2008 beta 2.
- Added support for `DbDataAdapter UpdateBatchSize`. Batching is fully supported including collapsing inserts down into the multi-value form if possible.

Bugs Fixed

- In an open connection where the server had disconnected unexpectedly, the status information of the connection would not be updated properly. (Bug #33909)
- The status of connections reported through the state change handler was not being updated correctly. (Bug #34082)
- When accessing tables from different databases within the same `TransactionScope`, the same user/password combination would be used for each database connection. MySQL Connector/Net does not handle multiple connections within the same transaction scope. An error is now returned if you attempt this process, instead of using the incorrect authorization information. (Bug #34204)
- Some speed improvements have been implemented in the `TokenizeSql` process used to identify elements of SQL statements. (Bug #34220)
- Incorporated some connection string cache optimizations sent to us by Maxim Mass. (Bug #34000)
- Commands executed from within the state change handler would fail with a `NULL` exception. (Bug #30964)
- Memory usage could increase and decrease significantly when updating or inserting a large number of rows. (Bug #31090)
- Column name metadata was not using the character set as defined within the connection string being used. (Bug #31185)
- Data cached from the connection string could return invalid information because the internal routines were not using case-sensitive semantics. This lead to updated connection string options not being recognized if they were of a different case than the existing cached values. (Bug #31433)
- When running a stored procedure multiple times on the same connection, the memory usage could increase indefinitely. (Bug #30116)
- Using compression in the MySQL connection with MySQL Connector/Net would be slower than using native (uncompressed) communication. (Bug #27865)
- The `MySqlDbType.Datetime` has been replaced with `MySqlDbType.DateTime`. The old format has been obsoleted. (Bug #26344)

Changes in MySQL Connector/Net Version 5.1.x

Changes in MySQL Connector/Net 5.1.8 (Not released)

Version 5.1.8 has no changelog entries.

Changes in MySQL Connector/Net 5.1.7 (2008-08-21)

Bugs Fixed

- There was a short circuit evaluation error in the `MySqlCommand.CheckState()` method. When the statement `connection == null` was true a `NullReferenceException` was thrown and not the expected `InvalidOperationException`. (Bug #38276)
- Documentation incorrectly stated that “the DataColumn class in .NET 1.0 and 1.1 does not permit columns with type of UInt16, UInt32, or UInt64 to be autoincrement columns”. (Bug #37350)

- As `MySqlDbType.DateTime` is not available in `VB.Net` the warning `The datetime enum value is obsolete` was always shown during compilation. (Bug #37406)
- An unknown `MySqlErrorCode` was encountered when opening a connection with an incorrect password. (Bug #37398)
- Executing a command that resulted in a fatal exception did not close the connection. (Bug #37991)
- In a .NET application MySQL Connector/Net modifies the connection string so that it contains several occurrences of the same option with different values. This is illustrated by the example that follows.

  The original connection string:

  ```
  host=localhost;database=test;uid=*****;pwd=*****;
  connect timeout=25; auto enlist=false;pooling=false;
  ```

  The connection string after closing `MySqlDataReader`:

  ```
  host=localhost;database=test;uid=*****;pwd=*****;
  connect timeout=25;auto enlist=false;pooling=false;
  Allow User Variables=True;Allow User Variables=False;
  Allow User Variables=True;Allow User Variables=False;
  ```

  (Bug #37955)
- `GetSchema` did not work correctly when querying for a collection, if using a non-English locale. (Bug #35459)
- When reading back a stored double or single value using the .NET provider, the value had less precision than the one stored. (Bug #33322)
- `SemaphoreFullException` is generated when application is closed. (Bug #36688)
- Using the MySQL Visual Studio plugin and a MySQL 4.1 server, certain field types (`ENUM`) would not be identified correctly. Also, when looking for tables, the plugin would list all tables matching a wildcard pattern of the database name supplied in the connection string, instead of only tables within the specified database. (Bug #30603)

Changes in MySQL Connector/Net 5.1.6 (2008-05-12)

Bugs Fixed

- An incorrect value for a bit field would returned in a multi-row query if a preceding value for the field returned `NULL`. (Bug #36313)
- The `DbCommandBuilder.QuoteIdentifer` method was not implemented. (Bug #35492)
- When creating a connection pool, specifying an invalid IP address will cause the entire application to crash, instead of providing an exception. (Bug #36432)
- The `MembershipProvider` will raise an exception when the connection string is configured with `enablePasswordRetrival = true` and `RequireQuestionAndAnswer = false`. (Bug #36159)
- When calling `GetNumberOfUsersOnline` an exception is raised on the submitted query due to a missing parameter. (Bug #36157)
- Tables with `GEOMETRY` field types would return an unknown data type exception. (Bug #36081)
- When creating a connection, setting the `ConnectionString` property of `MySqlConnection` to `NULL` would throw an exception. (Bug #35619)
- A race condition could occur within the procedure cache resulting the cache contents overflowing beyond the configured cache size. (Bug #34338)

- When altering a stored procedure within Visual Studio, the parameters to the procedure could be lost. (Bug #34359)
- Attempting to use an isolation level other than the default with a transaction scope would use the default isolation level. (Bug #34448)
- When using `SqlDataSource` to open a connection, the connection would not automatically be closed when access had completed. (Bug #34460)
- Using the `TableAdapter` wizard in combination with a suitable `SELECT` statement, only the associated `INSERT` statement would also be created, rather than the required `DELETE` and `UPDATE` statements. (Bug #31338)

Changes in MySQL Connector/Net 5.1.5 (Not released)

Version 5.1.5 has no changelog entries.

Changes in MySQL Connector/Net 5.1.4 (2007-11-20)

Bugs Fixed

- Trying to use a connection that was not open could return an ambiguous and misleading error message. (Bug #31262)
- A syntax error in a set of batch statements could leave the data adapter in a state that appears hung. (Bug #31930)
- MySQL Connector/Net would incorrectly report success when enlisting in a distributed transaction, although distributed transactions are not supported. (Bug #31703)
- A date string could be returned incorrectly by `MySqlDateTime.ToString()` when the date returned by MySQL was `0000-00-00 00:00:00`. (Bug #32010)
- Commands executed from within the state change handler would fail with a `NULL` exception. (Bug #30964)
- Memory usage could increase and decrease significantly when updating or inserting a large number of rows. (Bug #31090)
- Column name metadata was not using the character set as defined within the connection string being used. (Bug #31185)
- Data cached from the connection string could return invalid information because the internal routines were not using case-sensitive semantics. This lead to updated connection string options not being recognized if they were of a different case than the existing cached values. (Bug #31433)
- Installing over a failed uninstall of a previous version could result in multiple clients being registered in the `machine.config`. This would prevent certain aspects of the MySQL connection within Visual Studio to work properly. (Bug #31731)
- Creation of parameter objects with noninput direction using a constructor would fail. This was cause by some old legacy code preventing their use. (Bug #32093)
- Setting the size of a string parameter after the value could cause an exception. (Bug #32094)
- When running a stored procedure multiple times on the same connection, the memory usage could increase indefinitely. (Bug #30116)
- Extracting data through XML functions within a query returns the data as `System.Byte[]`. This was due to MySQL Connector/Net incorrectly identifying `BLOB` fields as binary, rather than text. (Bug #30233)

- When accessing certain statements, the command would timeout before the command completed. Because this cannot always be controlled through the individual command timeout options, a `default command timeout` has been added to the connection string options. (Bug #27958)
- Column types with only 1-bit (such as `BOOLEAN` and `TINYINT(1)` were not returned as boolean fields. (Bug #27959)
- The `MySqlDbType.Datetime` has been replaced with `MySqlDbType.DateTime`. The old format has been obsoleted. (Bug #26344)
- The server error code was not updated in the `Data[]` hash, which prevented `DbProviderFactory` users from accessing the server error code. (Bug #27436)
- Changing the connection string of a connection to one that changes the parameter marker after the connection had been assigned to a command but before the connection is opened could cause parameters to not be found. (Bug #13991)

Changes in MySQL Connector/Net 5.1.3 (2007-09-21, beta)

This is a new Beta development release, fixing recently discovered bugs.

Bugs Fixed

- An incorrect `ConstraintException` could be raised on an `INSERT` when adding rows to a table with a multiple-column unique key index. (Bug #30204)
- The availability of a MySQL server would not be reset when using pooled connections (`pooling=true`). This would lead to the server being reported as unavailable, even if the server become available while the application was still running. (Bug #29409)
- Calling `SHOW CREATE PROCEDURE` for routines with a hyphen in the catalog name produced a syntax error. (Bug #29526)
- Using the membership/role providers when `validationKey` or `decryptionKey` parameters are set to `AutoGenerate`, an exception would be raised when accessing the corresponding values. (Bug #29235)
- *Visual Studio Plugin*: Adding a new query based on a stored procedure that uses the `SELECT` statement would terminate the query/TableAdapter wizard. (Bug #29098)
- An exception would be thrown when using the Manage Role functionality within the web administrator to assign a role to a user. (Bug #29236)
- Using `TransactionScope` would cause an `InvalidOperationException`. (Bug #28709)
- The Saudi Hijri calendar was not supported. (Bug #29931)
- A `DATE` field would be updated with a date/time value, causing a `MySqlDataAdapter.Update()` exception. (Bug #30077)
- Connecting to a MySQL server earlier than version 4.1 would raise a `NullException`. (Bug #29476)
- Certain operations would not check the `UsageAdvisor` setting, causing log messages from the Usage Advisor even when it was disabled. (Bug #29124)
- Using the same connection string multiple times would result in `Database=`*`dbname`* appearing multiple times in the resulting string. (Bug #29123)
- A `FormatException` error would be raised if a parameter had not been found, instead of `Resources.ParameterMustBeDefined`. (Bug #29312)

Changes in MySQL Connector/Net 5.1.2 (2007-06-18)

This is a new Beta development release, fixing recently discovered bugs.

Bugs Fixed

- Log messages would be truncated to 300 bytes. (Bug #28706)
- Creating a user would fail due to the application name being set incorrectly. (Bug #28648)
- Accessing the results from a large query when using data compression in the connection would fail to return all the data. (Bug #28204)
- *Visual Studio Plugin*: Query Builder would fail to show `TINYTEXT` columns, and any columns listed after a `TINYTEXT` column correctly. (Bug #28437)
- *Visual Studio Plugin*: Adding a new query based on a stored procedure that used a `UPDATE`, `INSERT` or `DELETE` statement would terminate the query/TableAdapter wizard. (Bug #28536)
- *Visual Studio Plugin*: Update commands would not be generated correctly when using the TableAdapter wizard. (Bug #26347)

Changes in MySQL Connector/Net 5.1.1 (2007-05-23)

Bugs Fixed

- Running the statement `SHOW PROCESSLIST` would return columns as byte arrays instead of native columns. (Bug #28448)
- Building a connection string within a tight loop would show slow performance. (Bug #28167)
- Using `MySQLDataAdapter.FillSchema()` on a stored procedure would raise an exception: `Invalid attempt to access a field before calling Read()`. (Bug #27668)
- Installation of the MySQL Connector/Net on Windows would fail if VisualStudio had not already been installed. (Bug #28260)
- `DATETIME` fields from versions of MySQL before 4.1 would be incorrectly parsed, resulting in a exception. (Bug #23342)
- The `UNSIGNED` flag for parameters in a stored procedure would be ignored when using `MySqlCommandBuilder` to obtain the parameter information. (Bug #27679)
- MySQL Connector/Net would look for the wrong table when executing `User.IsRole().` (Bug #28251)
- Fixed password property on `MySqlConnectionStringBuilder` to use `PasswordPropertyText` attribute. This causes dots to show instead of actual password text.

Changes in MySQL Connector/Net 5.1.0 (2007-05-01)

Functionality Added or Changed

- Added Membership and Role provider contributed by Sean Wright (thanks!).
- GetSchema will now report objects relative to the currently selected database. What this means is that passing in null as a database restriction will report objects on the currently selected database only.
- Rewrote stored procedure parsing code using a new SQL tokenizer. Really nasty procedures including nested comments are now supported.
- Now compiles for .NET CF 2.0.

Changes in MySQL Connector/Net Version 5.0.x

Changes in MySQL Connector/Net 5.0.10 (Not released)

Version 5.0.10 has no changelog entries.

Changes in MySQL Connector/Net 5.0.9 (Not released)

Version 5.0.9 has no changelog entries.

Changes in MySQL Connector/Net 5.0.8 (2007-08-21)

Note

This version introduces a new installer technology.

Bugs Fixed

- An incorrect `ConstraintException` could be raised on an `INSERT` when adding rows to a table with a multiple-column unique key index. (Bug #30204)
- The availability of a MySQL server would not be reset when using pooled connections (`pooling=true`). This would lead to the server being reported as unavailable, even if the server become available while the application was still running. (Bug #29409)
- Fixed bug where MySQL Connector/Net was hand building some date time patterns rather than using the patterns provided under CultureInfo. This caused problems with some calendars that do not support the same ranges as Gregorian.. (Bug #29931)
- Calling `SHOW CREATE PROCEDURE` for routines with a hyphen in the catalog name produced a syntax error. (Bug #29526)
- A `DATE` field would be updated with a date/time value, causing a `MySqlDataAdapter.Update()` exception. (Bug #30077)
- Log messages would be truncated to 300 bytes. (Bug #28706)
- Certain operations would not check the `UsageAdvisor` setting, causing log messages from the Usage Advisor even when it was disabled. (Bug #29124)
- Extracting data through XML functions within a query returns the data as `System.Byte[]`. This was due to MySQL Connector/Net incorrectly identifying `BLOB` fields as binary, rather than text. (Bug #30233)
- Using the same connection string multiple times would result in `Database=`*`dbname`* appearing multiple times in the resulting string. (Bug #29123)
- A `FormatException` error would be raised if a parameter had not been found, instead of `Resources.ParameterMustBeDefined`. (Bug #29312)
- Accessing the results from a large query when using data compression in the connection will fail to return all the data. (Bug #28204)
- Fixed some serious issues with command timeout and cancel that could present as exceptions about thread ownership. The issue was that not all queries cancel the same. Some produce resultsets while others don't. ExecuteReader had to be changed to check for this.
- Fixed problem where a command timing out just after it actually finished would cause an exception to be thrown on the command timeout thread which would then be seen as an unhandled exception.
- Fixed problem where any attempt to not read all the records returned from a select where each row of the select is greater than 1024 bytes would hang the driver.

- Fixed the database schema collection so that it works on servers that are not properly respecting the `lower_case_table_names` [492] setting.
- Fixed problem where we were not closing prepared statement handles when commands are disposed. This could lead to using up all prepared statement handles on the server.
- Fixed problem where `MySqlConnection.BeginTransaction` checked the drivers status var before checking if the connection was open. The result was that the driver could report an invalid condition on a previously opened connection.

Changes in MySQL Connector/Net 5.0.7 (2007-05-18)

Bugs Fixed

- When cloning an open `MySqlClient.MySqlConnection` with the `Persist Security Info=False` option set, the cloned connection is not usable because the security information has not been cloned. (Bug #27269)
- Running the statement `SHOW PROCESSLIST` would return columns as byte arrays instead of native columns. (Bug #28448)
- Enlisting a null transaction would affect the current connection object, such that further enlistment operations to the transaction are not possible. (Bug #26754)
- The `CreateFormat` column of the `DataTypes` collection did not contain a format specification for creating a new column type. (Bug #25947)
- Using logging (with the `logging=true` parameter to the connection string) would not generate a log file. (Bug #27765)
- Building a connection string within a tight loop would show slow performance. (Bug #28167)
- The `characterset` property would not be identified during a connection (also affected Visual Studio Plugin). (Bug #26147, Bug #27240)
- Using `MySQLDataAdapter.FillSchema()` on a stored procedure would raise an exception: `Invalid attempt to access a field before calling Read()`. (Bug #27668)
- Attempting to change the `Connection Protocol` property within a `PropertyGrid` control would raise an exception. (Bug #26472)
- `DATETIME` fields from versions of MySQL before 4.1 would be incorrectly parsed, resulting in a exception. (Bug #23342)
- The `UNSIGNED` flag for parameters in a stored procedure would be ignored when using `MySqlCommandBuilder` to obtain the parameter information. (Bug #27679)
- If you close an open connection with an active transaction, the transaction is not automatically rolled back. (Bug #27289)

Changes in MySQL Connector/Net 5.0.6 (2007-03-22)

Bugs Fixed

- `cmd.Parameters.RemoveAt("Id")` will cause an error if the last item is requested. (Bug #27187)
- `MySqlParameterCollection` and parameters added with `Insert` method can not be retrieved later using `ParameterName`. (Bug #27135)
- MySQL Visual Studio Plugin 1.1.2 does not work with MySQL Connector/Net 5.0.5. (Bug #26960)
- Exception thrown when using large values in `UInt64` parameters. (Bug #27093)

- Publisher listed in "Add/Remove Programs" is not consistent with other MySQL products. (Bug #27253)
- `DESCRIBE ...` SQL statement returns byte arrays rather than data on MySQL versions older than 4.1.15. (Bug #27221)

Changes in MySQL Connector/Net 5.0.5 (2007-03-07)

Functionality Added or Changed

- Added `Use Procedure Bodies` connection string option to enable calling procedures without using procedure metadata.
- Fixed problem with calling stored functions when a return parameter was not given.
- Fixed problem with parameter name hashing where the hashes were not getting updated when parameters were removed from the collection.
- Return parameters created with DeriveParameters now have the name `RETURN_VALUE`.
- Added `MySqlParameterCollection.AddWithValue` and marked the `Add(name, value)` method as obsolete.
- Fixed problem that prevented use of `SchemaOnly` or `SingleRow` command behaviors with stored procedures or prepared statements.
- Assembly now properly appears in the Visual Studio 2005 Add/Remove Reference dialog.
- Reverted behavior that required parameter names to start with the parameter marker. We apologize for this back and forth but we mistakenly changed the behavior to not match what `SqlClient` supports. We now support using either syntax for adding parameters however we also respond exactly like `SqlClient` in that if you ask for the index of a parameter using a syntax different from when you added the parameter, the result will be -1.

Bugs Fixed

- `BINARY` and `VARBINARY` columns would be returned as a string, not binary, data type. (Bug #25605)
- `MySqlConnection` throws an exception when connecting to MySQL v4.1.7. (Bug #25726)
- Incorrect values/formats would be applied when the `OldSyntax` connection string option was used. (Bug #25950)
- High CPU utilization would be experienced when there is no idle connection waiting when using pooled connections through `MySqlPool.GetConnection`. (Bug #24373)
- Opening a connection would be slow due to host name lookup. (Bug #26152)
- The `UpdateRowSource.FirstReturnedRecord` method does not work. (Bug #25569)
- When closing and then re-opening a connection to a database, the character set specification is lost. (Bug #25614)
- Filling a table schema through a stored procedure triggers a runtime error. (Bug #25609)
- Returned data types of a `DataTypes` collection do not contain the right correct CLR data type. (Bug #25907)
- When connecting to a MySQL Server earlier than version 4.1, the connection would hang when reading data. (Bug #25458)
- Registry would be incorrectly populated with installation locations. (Bug #25928)
- `MySqlConnection.GetSchema` fails with `NullReferenceException` for Foreign Keys. (Bug #26660)

- Times with negative values would be returned incorrectly. (Bug #25912)
- MySQL Connector/Net would not compile properly when used with Mono 1.2. (Bug #24263)
- MySQL Connector/Net would fail to install under Windows Vista. (Bug #26430)
- Using `ExecuteScalar()` with more than one query, where one query fails, will hang the connection. (Bug #25443)
- When a `MySqlConversionException` is raised on a remote object, the client application would receive a `SerializationException` instead. (Bug #24957)
- A critical `ConnectionPool` error would result in repeated `System.NullReferenceException`. (Bug #25603)
- When connecting to a server, the return code from the connection could be zero, even though the host name was incorrect. (Bug #24802)
- `GetSchema` and `DataTypes` would throw an exception due to an incorrect table name. (Bug #25906)
- `SELECT` did not work correctly when using a `WHERE` clause containing a UTF-8 string. (Bug #25651)
- Applications would crash when calling with `CommandType` set to `StoredProcedure`.

Changes in MySQL Connector/Net 5.0.4 (Not released)

This is a new Beta development release, fixing recently discovered bugs.

Version 5.0.4 has no changelog entries.

Changes in MySQL Connector/Net 5.0.3 (2007-01-05)

Functionality Added or Changed

- SSL support has been updated.
- The ShapZipLib library has been replaced with the deflate support provided within .NET 2.0.
- Support for the embedded server and client library have been removed from this release. Support will be added back to a later release.
- Improved speed and performance by re-architecting certain sections of the code.
- The `ViewColumns GetSchema` collection has been updated.
- The `CommandBuilder.DeriveParameters` function has been updated to the procedure cache.
- Metadata from stored procedures and stored function execution are cached.
- The `MySqlCommand` object now supports asynchronous query methods. This is implemented useg the `BeginExecuteNonQuery` and `EndExecuteNonQuery` methods.
- PerfMon hooks have been added to monitor the stored procedure cache hits and misses.
- Usage Advisor has been implemented. The Usage Advisor checks your queries and will report if you are using the connection inefficiently.

Bugs Fixed

- When using a `DbNull.Value` as the value for a parameter value, and then later setting a specific value type, the command would fail with an exception because the wrong type was implied from the `DbNull.Value`. (Bug #24565)
- Using `Driver.IsTooOld()` would return the wrong value. (Bug #24661)

- Nested transactions (which are unsupported)do not raise an error or warning. (Bug #22400)
- When adding parameter objects to a command object, if the parameter direction is set to `ReturnValue` before the parameter is added to the command object then when the command is executed it throws an error. (Bug #25013)
- Deleting a connection to a disconnected server when using the Visual Studio Plugin would cause an assertion failure. (Bug #23687)
- Additional text added to error message (Bug #25178)
- An exception would be raised, or the process would hang, if `SELECT` [627] privileges on a database were not granted and a stored procedure was used. (Bug #25033)
- Stored procedure executions are not thread safe. (Bug #23905)

Changes in MySQL Connector/Net 5.0.2 (2006-11-06)

Functionality Added or Changed

- **Important change:** Due to a number of issues with the use of server-side prepared statements, MySQL Connector/Net 5.0.2 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

  To enable server-side prepared statements you must add the following configuration property to your connector string properties:

  ```
  ignore prepare=false
  ```

  The default value of this property is true.
- Implemented a stored procedure cache. By default, the connector caches the metadata for the last 25 procedures that are seen. You can change the number of procedures that are cached by using the `procedure cache` connection string.
- An `Ignore Prepare` option has been added to the connection string options. If enabled, prepared statements will be disabled application-wide. The default for this option is true.

Bugs Fixed

- An exception would be thrown when calling `GetSchemaTable` and `fields` was null. (Bug #23538)
- During installation, an antivirus error message would be raised (indicating a malicious script problem). (Bug #23245)
- One system where IPv6 was enabled, MySQL Connector/Net would incorrectly resolve host names. (Bug #23758)
- A `System.FormatException` exception would be raised when invoking a stored procedure with an `ENUM` input parameter. (Bug #23268)
- Using Windows Vista (RC2) as a nonprivileged user would raise a `Registry key 'Global' access denied`. (Bug #22882)
- Column names with accented characters were not parsed properly causing malformed column names in result sets. (Bug #23657)
- Creating a connection through the Server Explorer when using the Visual Studio Plugin would fail. The installer for the Visual Studio Plugin has been updated to ensure that MySQL Connector/Net 5.0.2 must be installed. (Bug #23071)
- Within Mono, using the `PreparedStatement` interface could result in an error due to a `BitArray` copying error. (Bug #18186)

- MySQL Connector/Net did not work as a data source for the `SqlDataSource` object used by ASP.NET 2.0. (Bug #16126)

Changes in MySQL Connector/Net 5.0.1 (2006-10-01)

Bugs Fixed

- The `MySqlexception` class is now derived from the `DbException` class. (Bug #21874)
- Starting a transaction on a connection created by `MySql.Data.MySqlClient.MySqlClientFactory`, using `BeginTransaction` without specifying an isolation level, causes the SQL statement to fail with a syntax error. (Bug #22042)
- The `#` would not be accepted within column/table names, even though it was valid. (Bug #21521)
- MySQL Connector/Net on a Turkish operating system, may fail to execute certain SQL statements correctly. (Bug #22452)
- Submitting an empty string to a command object through `prepare` raises an `System.IndexOutOfRangeException`, rather than a MySQL Connector/Net exception. (Bug #18391)
- Incorrect field/data lengths could be returned for `VARCHAR` UTF8 columns. (Bug #14592)
- You can now install the MySQL Connector/Net MSI package from the command line using the `/passive`, `/quiet`, `/q` options. (Bug #19994)
- Executing multiple queries as part of a transaction returns `There is already an openDataReader associated with this Connection which must be closed first`. (Bug #7248)
- Using `ExecuteScalar` with a datetime field, where the value of the field is "0000-00-00 00:00:00", a `MySqlConversionException` exception would be raised. (Bug #11991)
- An `MySql.Data.Types.MySqlConversionException` would be raised when trying to update a row that contained a date field, where the date field contained a zero value (0000-00-00 00:00:00). (Bug #9619)

Changes in MySQL Connector/Net 5.0.0 (2006-08-08)

Functionality Added or Changed

- Implemented `MySqlConnectionBuilder` class.
- Completely refactored how column values are handled to avoid boxing in some cases.
- Implemented Usage Advisor.
- Added Async query methods.
- Implemented classes and interfaces for ADO.Net 2.0 support.
- Added perfmon hooks for stored procedure cache hits and misses.
- Implemented `MySqlClientFactory` class.
- Added internal implemention of SHA1 so we don't have to distribute the OpenNetCF on mobile devices.
- Added procedure metadata caching.
- Reworked connection string classes to be simpler and faster.
- Reimplemented PacketReader/PacketWriter support into `MySqlStream` class.

- Added usage advisor warnings for requesting column values by the wrong type.
- Refactored test suite to test all protocols in a single pass.
- Replaced use of ICSharpCode with .NET 2.0 internal deflate support.

Bugs Fixed

- CommandText: Question mark in comment line is being parsed as a parameter. (Bug #6214)

Changes in MySQL Connector/Net Version 1.0.x

Changes in MySQL Connector/Net 1.0.11 (Not released)

Version 1.0.11 has no changelog entries.

Changes in MySQL Connector/Net 1.0.10 (2007-08-24)

Bugs Fixed

- An incorrect `ConstraintException` could be raised on an `INSERT` when adding rows to a table with a multiple-column unique key index. (Bug #30204)
- The availability of a MySQL server would not be reset when using pooled connections (`pooling=true`). This would lead to the server being reported as unavailable, even if the server become available while the application was still running. (Bug #29409)
- `BINARY` and `VARBINARY` columns would be returned as a string, not binary, data type. (Bug #25605)
- `MySqlParameterCollection` and parameters added with `Insert` method can not be retrieved later using `ParameterName`. (Bug #27135)
- High CPU utilization would be experienced when there is no idle connection waiting when using pooled connections through `MySqlPool.GetConnection`. (Bug #24373)
- Publisher listed in "Add/Remove Programs" is not consistent with other MySQL products. (Bug #27253)
- When a `MySqlConversionException` is raised on a remote object, the client application would receive a `SerializationException` instead. (Bug #24957)
- A critical `ConnectionPool` error would result in repeated `System.NullReferenceException`. (Bug #25603)

Changes in MySQL Connector/Net 1.0.9 (2007-02-02)

Functionality Added or Changed

- **Important change:** Due to a number of issues with the use of server-side prepared statements, MySQL Connector/Net 5.0.2 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

  To enable server-side prepared statements you must add the following configuration property to your connector string properties:

  ```
  ignore prepare=false
  ```

  The default value of this property is true.
- Implemented a stored procedure cache. By default, the connector caches the metadata for the last 25 procedures that are seen. You can change the number of procedures that are cached by using the `procedure cache` connection string.

- An `Ignore Prepare` option has been added to the connection string options. If enabled, prepared statements will be disabled application-wide. The default for this option is true.
- Improved `CommandBuilder.DeriveParameters` to first try and use the procedure cache before querying for the stored procedure metadata. Return parameters created with `DeriveParameters` now have the name `RETURN_VALUE`.
- **Important change:** Binaries for .NET 1.0 are no longer supplied with this release. If you need support for .NET 1.0, you must build from source.
- The ICSharpCode ZipLib is no longer used by the Connector, and is no longer distributed with it.

Bugs Fixed

- When using a `DbNull.Value` as the value for a parameter value, and then later setting a specific value type, the command would fail with an exception because the wrong type was implied from the `DbNull.Value`. (Bug #24565)
- An `System.OverflowException` would be raised when accessing a varchar field over 255 bytes. (Bug #23749)
- Using `Driver.IsTooOld()` would return the wrong value. (Bug #24661)
- Nested transactions do not raise an error or warning. (Bug #22400)
- Additional text added to error message. (Bug #25178)
- When adding parameter objects to a command object, if the parameter direction is set to `ReturnValue` before the parameter is added to the command object then when the command is executed it throws an error. (Bug #25013)
- `MySqlConnection` throws a `NullReferenceException` and `ArgumentNullException` when connecting to MySQL v4.1.7. (Bug #25726)
- When closing and then re-opening a connection to a database, the character set specification is lost. (Bug #25614)
- Trying to fill a table schema through a stored procedure triggers a runtime error. (Bug #25609)
- One system where IPv6 was enabled, MySQL Connector/Net would incorrectly resolve host names. (Bug #23758)
- Times with negative values would be returned incorrectly. (Bug #25912)
- The `CommandBuilder` would mistakenly add insert parameters for a table column with auto incrementation enabled. (Bug #23862)
- Using `ExecuteScalar()` with more than one query, where one query fails, will hang the connection. (Bug #25443)
- When connecting to a server, the return code from the connection could be zero, even though the host name was incorrect. (Bug #24802)
- Stored procedure executions are not thread safe. (Bug #23905)
- `SELECT` did not work correctly when using a `WHERE` clause containing a UTF-8 string. (Bug #25651)
- Within Mono, using the `PreparedStatement` interface could result in an error due to a `BitArray` copying error. (Bug #18186)

Changes in MySQL Connector/Net 1.0.8 (2006-10-20)

Functionality Added or Changed

- The method for retrieving stored procedure metadata has been changed so that users without `SELECT` [627] privileges on the `mysql.proc` table can use a stored procedure.
- Stored procedures are now cached.

Bugs Fixed

- The `#` would not be accepted within column/table names, even though it was valid. (Bug #21521)
- MySQL Connector/Net on a Turkish operating system, may fail to execute certain SQL statements correctly. (Bug #22452)
- Calling `Close` on a connection after calling a stored procedure would trigger a `NullReferenceException`. (Bug #20581)
- When working with multiple threads, character set initialization would generate errors. (Bug #17106)
- Submitting an empty string to a command object through `prepare` raises an `System.IndexOutOfRangeException`, rather than a MySQL Connector/Net exception. (Bug #18391)
- Called `MySqlCommandBuilder.DeriveParameters` for a stored procedure that has no paramers would cause an application crash. (Bug #15077)
- The connection string parser did not permit single or double quotation marks in the password. (Bug #16659)
- The CommandBuilder ignored Unsigned flag at Parameter creation. (Bug #17375)
- CHAR type added to MySqlDbType. (Bug #17749)
- Parameter substitution in queries where the order of parameters and table fields did not match would substitute incorrect values. (Bug #19261)
- The `MySqlDateTime` class did not contain constructors. (Bug #15112)
- When running a query that included a date comparison, a DateReader error would be raised. (Bug #19481)
- When using an unsigned 64-bit integer in a stored procedure, the unsigned bit would be lost stored. (Bug #16934)
- Incorrect field/data lengths could be returned for `VARCHAR` UTF8 columns. (Bug #14592)
- A `SELECT` query on a table with a date with a value of `'0000-00-00'` would hang the application. (Bug #17736)
- You can now install the MySQL Connector/Net MSI package from the command line using the `/passive`, `/quiet`, `/q` options. (Bug #19994)
- The DiscoverParameters function would fail when a stored procedure used a `NUMERIC` parameter type. (Bug #19515)
- Unsigned data types were not properly supported. (Bug #16788)
- `DataReader` would show the value of the previous row (or last row with nonnull data) if the current row contained a `datetime` field with a null value. (Bug #16884)
- `IDataRecord.GetString` would raise `NullPointerException` for null values in returned rows. Method now throws `SqlNullValueException`. (Bug #19294)
- An exception would be raised when using an output parameter to a `System.String` value. (Bug #17814)

- When using `MySqlDataAdapter`, connections to a MySQL server may remain open and active, even though the use of the connection has been completed and the data received. (Bug #8131)
- Executing multiple queries as part of a transaction returns `There is already an openDataReader associated with this Connection which must be closed first`. (Bug #7248)
- Using `ExecuteScalar` with a datetime field, where the value of the field is "0000-00-00 00:00:00", a `MySqlConversionException` exception would be raised. (Bug #11991)
- An `MySql.Data.Types.MySqlConversionException` would be raised when trying to update a row that contained a date field, where the date field contained a zero value (0000-00-00 00:00:00). (Bug #9619)

Changes in MySQL Connector/Net 1.0.7 (2005-11-21)

Bugs Fixed

- Calling a stored procedure where a parameter contained special characters (such as `'@'`) would produce an exception. Note that `ANSI_QUOTES` [572] had to be enabled to make this possible. (Bug #13753)
- A `#42000Query was empty` exception occurred when executing a query built with `MySqlCommandBuilder`, if the query string ended with a semicolon. (Bug #14631)
- The parameter collection object's `Add()` method added parameters to the list without first checking to see whether they already existed. Now it updates the value of the existing parameter object if it exists. (Bug #13927)
- Added support for the `cp932` character set. (Bug #13806)
- The `Ping()` method did not update the `State` property of the `Connection` object. (Bug #13658)
- Implemented the `MySqlCommandBuilder.DeriveParameters` method that is used to discover the parameters for a stored procedure. (Bug #13632)
- A statement that contained multiple references to the same parameter could not be prepared. (Bug #13541)
- Unsigned `tinyint` (NET byte) would lead to and incorrectly determined parameter type from the parameter value. (Bug #18570)

Changes in MySQL Connector/Net 1.0.6 (2005-10-03)

Bugs Fixed

- Field names that contained the following characters caused errors: `()%<>/` (Bug #13036)
- MySQL Connector/Net 1.0.5 could not connect on Mono. (Bug #13345)
- The MySQL Connector/Net 1.0.5 installer would not install alongside MySQL Connector/Net 1.0.4. (Bug #12835)
- Serializing a parameter failed if the first value passed in was `NULL`. (Bug #13276)
- The `nant` build sequence had problems. (Bug #12978)

Changes in MySQL Connector/Net 1.0.5 (2005-08-29)

Bugs Fixed

- The `ConnectionString` property could not be set when a `MySqlConnection` object was added with the designer. (Bug #12551, Bug #8724)

- With multiple hosts in the connection string, MySQL Connector/Net would not connect to the last host in the list. (Bug #12628)
- MySQL Connector/Net could not connect to MySQL 4.1.14. (Bug #12771)
- A call to a stored procedure caused an exception if the stored procedure had no parameters. (Bug #11542)
- Added support to call a stored function from MySQL Connector/Net. (Bug #10644)
- MySQL Connector/Net interpreted the new decimal data type as a byte array. (Bug #11294)
- Trying to use a stored procedure when `Connection.Database` was not populated generated an exception. (Bug #11450)
- Connection could fail when .NET thread pool had no available worker threads. (Bug #10637)
- Certain malformed queries would trigger a `Connection must be valid and open` error message. (Bug #11490)
- Trying to read a `TIMESTAMP` column generated an exception. (Bug #7951)
- Decimal parameters caused syntax errors. (Bug #10152, Bug #11550, Bug #10486)
- Parameters were not recognized when they were separated by linefeeds. (Bug #9722)
- The `cp1250` character set was not supported. (Bug #11621)
- Calling `MySqlConnection.clone` when a connection string had not yet been set on the original connection would generate an error. (Bug #10281)
- The `MySqlCommandBuilder` class could not handle queries that referenced tables in a database other than the default database. (Bug #8382)
- MySQL Connector/Net could not work properly with certain regional settings. (WL#8228)

Changes in MySQL Connector/Net 1.0.4 (2005-01-20)

Bugs Fixed

- `MySqlCommand.Connection` returns an IDbConnection. (Bug #7258)
- Quote character \222 not quoted in `EscapeString`. (Bug #7724)
- Clone method bug in `MySqlCommand`. (Bug #7478)
- Calling prepare causing exception. (Bug #7243)
- `MySqlDataReader.GetString(index)` returns non-Null value when field is `Null`. (Bug #7612)
- `MySqlAdapter.Fill` method throws error message `Non-negative number required`. (Bug #7345)
- Problem with Multiple resultsets. (Bug #7436)
- `MySqlReader.GetInt32` throws exception if column is unsigned. (Bug #7755)
- `GetBytes` was not working. (Bug #7704)
- Fixed problem that causes named pipes to not work with some blob functionality.
- Fixed another small problem with prepared statements.
- Added or filled out several more topics in the API reference documentation.
- Fixed problem with shared memory connections.

Changes in MySQL Connector/Net 1.0.3 (2004-10-12, gamma)

Bugs Fixed

- Inserting `DateTime` causes `System.InvalidCastException` to be thrown. (Bug #7132)
- Integer "out" parameter from stored procedure returned as string. (Bug #6668)
- Int64 Support in `MySqlCommand` Parameters. (Bug #6863)
- Invalid query string when using inout parameters (Bug #7133)
- Errors in parsing stored procedure parameters. (Bug #6902)
- InvalidCast when using `DATE_ADD`-function. (Bug #6879)
- `MySqlDateTime` in Datatables sorting by Text, not Date. (Bug #7032)
- `MySqlDataReader.GetChar(int i)` throws `IndexOutOfRange` exception. (Bug #6770)
- An Open Connection has been Closed by the Host System. (Bug #6634)
- Fixed Invalid character set index: 200. (Bug #6547)
- Exception stack trace lost when re-throwing exceptions. (Bug #6983)
- Test suite fails with MySQL 4.0 because of case sensitivity of table names. (Bug #6831)
- Made MySQL the default named pipe name.
- Now `SHOW COLLATION` is used upon connection to retrieve the full list of charset ids.
- Changed the name of the test suite to `MySql.Data.Tests.dll`.
- Added Ping method to `MySqlConnection`.
- Added `ServerThread` property to `MySqlConnection` to expose server thread id.
- Fixed problem where multiple resultsets having different numbers of columns would cause a problem.
- Fixed major problem with detecting null values when using prepared statements.
- Installer now includes options to install into GAC and create Start Menu items.
- Connections now do not have to give a database on the connection string.

Changes in MySQL Connector/Net 1.0.2 (2004-11-15, gamma)

Bugs Fixed

- Fixed Objects not being disposed (Bug #6649)
- Fixed double type handling in MySqlParameter(string parameterName, object value). (Bug #6428)
- Fixed #HY000 Illegal mix of collations (latin1_swedish_ci,IMPLICIT) and (utf8_general_ (Bug #6322)
- Fixed Installation directory ignored using custom installation (Bug #6329)
- Fixed Charset-map for UCS-2 (Bug #6541)
- Fixed Zero date "0000-00-00" is returned wrong when filling Dataset (Bug #6429)
- Fixed problem where calling stored procedures might cause an "Illegal mix of collations" problem.
- Fixed Long inserts take very long time (Bu #5453)

- Fixed problem where setting command text leaves the command in a prepared state
- Updated the installer to include the new samples
- Provider is now using character set specified by server as default
- Fixed problem with MySqlBinary where string values could not be used to update extended text columns
- Added charset connection string option
- Added the TableEditor CS and VB sample

Changes in MySQL Connector/Net 1.0.1 (2004-10-27, beta)

Bugs Fixed

- Setting `DbType` threw a `NullReferenceException`. (Bug #5469)
- Fixed constructor initialize problems in MySqlCommand() (Bug #5613)
- Fixed System.OverflowException when using `YEAR` data type. (Bug #6036)
- Fixed Yet Another "object reference not set to an instance of an object" (Bug #5496)
- Fixed Parsing the ';' char (Bug #5876)
- Fixed MySqlDataReader and 'show tables from ...' behavior (Bug #5256)
- Fixed problem where MySqlParameterCollection.Add() would throw unclear exception when given a null value (Bug #5621)
- Cannot run a stored procedure populating mysqlcommand.parameters (Bug #5474)
- Fixed IndexOutOfBounds when reading `BLOB` with `DataReader` with `GetString(index)`. (Bug #6230)
- Fixed MySqlDateTime sets IsZero property on all subseq.records after first zero found (Bug #6006)
- `MySqlCommand` saw instances of `"?"` as parameters in string literals. (Bug #5392)
- Possible bug in MySqlParameter(string, object) constructor (Bug #5602)
- Fixed NET Connector source missing resx files (Bug #6216)
- Fixed serializing of floating point parameters (double, numeric, single, decimal) (Bug #5900)
- Fixed Method TokenizeSql() uses only a limited set of valid characters for parameters (Bug #6217)
- `DataReader` reported all rows as `NULL` if one row was `NULL`. (Bug #5388)
- Fixed Can't display Chinese correctly (Bug #5288)
- Fixed missing Reference in DbType setter (Bug #5897)
- Fixed GetBoolean returns wrong values (Bug #6227)
- IsNullable error (Bug #5796)
- Fixed DBNull Values causing problems with retrieving/updating queries. (Bug #5798)
- Calling `GetChars` on a `LONGTEXT` column threw an exception. (Bug #5458)
- Virtualized driver subsystem so future releases could easily support client or embedded server support

- CP1252 is now used for Latin1 only when the server is 4.1.2 and later
- Refactored compression code into CompressedStream to clean up NativeDriver
- Fixed problem where Min Pool Size was not being respected
- Fixed problem where connector was not issuing a CMD_QUIT before closing the socket
- Fixed Russian character support as well
- Fixed problem with ConnectionInternal where a key might be added more than once
- Implemented SequentialAccess
- Using PacketWriter instead of Packet for writing to streams
- Added Aggregate function test (wasn't really a bug)
- Field buffers being reused to decrease memory allocations and increase speed
- Fixed problem where connection lifetime on the connect string was not being respected
- Added test case for resetting the command text on a prepared command
- Fixed problem where using old syntax while using the interfaces caused problems
- Fixed problem in PacketReader where it could try to allocate the wrong buffer size in EnsureCapacity

Changes in MySQL Connector/Net 1.0.0 (2004-09-01)

Bugs Fixed

- Removed some last references to ByteFX.
- Fixed problem with using compression.
- Updated many of the test cases.
- Thai encoding not correctly supported. (Bug #3889)
- Added `COPYING.rtf` file for use in installer.
- Removed all of the XML comment warnings.
- Bumped version number to 1.0.0 for beta 1 release.

Changes in MySQL Connector/Net Version 0.9.0 (30 August 2004)

- Added test fixture for prepared statements.
- All type classes now implement a `SerializeBinary` method for sending their data to a `PacketWriter`.
- Added `PacketWriter` class that will enable future low-memory large object handling.
- Fixed many small bugs in running prepared statements and stored procedures.
- Changed command so that an exception will not be thrown in executing a stored procedure with parameters in old syntax mode.
- `SingleRow` behavior now working right even with limit.
- `GetBytes` now only works on binary columns.
- Logger now truncates long SQL commands so blob columns do not blow out our log.

- Host and database now have a default value of "" unless otherwise set.
- Connection Timeout seems to be ignored. (Bug #5214)
- Added test case for bug# 5051: GetSchema not working correctly.
- Fixed problem where `GetSchema` would return false for `IsUnique` when the column is key.
- `MySqlDataReader GetXXX` methods now using the field level `MySqlValue` object and not performing conversions.
- `DataReader` returning `NULL` for time column. (Bug #5097)
- Added test case for `LOAD DATA LOCAL INFILE`.
- Added replacetext custom nant task.
- Added `CommandBuilderTest` fixture.
- Added Last One Wins feature to `CommandBuilder`.
- Fixed persist security info case problem.
- Fixed `GetBool` so that 1, true, "true", and "yes" all count as true.
- Make parameter mark configurable.
- Added the "old syntax" connection string parameter to enable use of @ parameter marker.
- `MySqlCommandBuilder`. (Bug #4658)
- `ByteFX.MySqlClient` caches passwords if `Persist Security Info` is false. (Bug #4864)
- Updated license banner in all source files to include FLOSS exception.
- Added new .Types namespace and implementations for most current MySql types.
- Added `MySqlField41` as a subclass of `MySqlField`.
- Changed many classes to now use the new .Types types.
- Changed type `enum int` to `Int32`, `short` to `Int16`, and `bigint` to `Int64`.
- Added dummy types `UInt16`, `UInt32`, and `UInt64` to allow an unsigned parameter to be made.
- Connections are now reset when they are pulled from the connection pool.
- Refactored auth code in driver so it can be used for both auth and reset.
- Added `UserReset` test in `PoolingTests.cs`.
- Connections are now reset using `COM_CHANGE_USER` when pulled from the pool.
- Implemented `SingleResultSet` behavior.
- Implemented support of unicode.
- Added char set mappings for utf-8 and ucs-2.
- Time fields overflow using bytefx .net mysql driver (Bug #4520)
- Modified time test in data type test fixture to check for time spans where hours > 24.
- Wrong string with backslash escaping in `ByteFx.Data.MySqlClient.MySqlParameter`. (Bug #4505)
- Added code to Parameter test case TestQuoting to test for backslashes.

- `MySqlCommandBuilder` fails with multi-word column names. (Bug #4486)
- Fixed bug in `TokenizeSql` where underscore would terminate character capture in parameter name.
- Added test case for spaces in column names.
- `MySqlDataReader.GetBytes` do not work correctly. (Bug #4324)
- Added `GetBytes()` test case to `DataReader` test fixture.
- Now reading all server variables in `InternalConnection.Configure` into `Hashtable`.
- Now using `string[]` for index map in `CharSetMap`.
- Added CRInSQL test case for carriage returns in SQL.
- Setting maxPacketSize to default value in `Driver.ctor`.
- Setting `MySqlDbType` on a parameter doesn't set generic type. (Bug #4442)
- Removed obsolete data types `Long` and `LongLong`.
- Overflow exception thrown when using "use pipe" on connection string. (Bug #4071)
- Changed "use pipe" keyword to "pipe name" or just "pipe".
- Enable reading multiple resultsets from a single query.
- Added flags attribute to `ServerStatusFlags` enum.
- Changed name of `ServerStatus` enum to `ServerStatusFlags`.
- Inserted data row doesn't update properly.
- Error processing show create table. (Bug #4074)
- Change `Packet.ReadLenInteger` to `ReadPackedLong` and added `packet.ReadPackedInteger` that always reads integers packed with 2,3,4.
- Added `syntax.cs` test fixture to test various SQL syntax bugs.
- Improper handling of time values. Now time value of 00:00:00 is not treated as null. (Bug #4149)
- Moved all test suite files into `TestSuite` folder.
- Fixed bug where null column would move the result packet pointer backward.
- Added new nant build script.
- Clear tablename so it will be regen'ed properly during the next `GenerateSchema`. (Bug #3917)
- `GetValues` was always returning zero and was also always trying to copy all fields rather than respecting the size of the array passed in. (Bug #3915)
- Implemented shared memory access protocol.
- Implemented prepared statements for MySQL 4.1.
- Implemented stored procedures for MySQL 5.0.
- Renamed `MySqlInternalConnection` to `InternalConnection`.
- SQL is now parsed as chars, fixes problems with other languages.
- Added logging and allow batch connection string options.

- `RowUpdating` event not set when setting the `DataAdapter` property. (Bug #3888)
- Fixed bug in char set mapping.
- Implemented 4.1 authentication.
- Improved open/auth code in driver.
- Improved how connection bits are set during connection.
- Database name is now passed to server during initial handshake.
- Changed namespace for client to `MySql.Data.MySqlClient`.
- Changed assembly name of client to `MySql.Data.dll`.
- Changed license text in all source files to GPL.
- Added the `MySqlClient.build` Nant file.
- Removed the mono batch files.
- Moved some of the unused files into notused folder so nant build file can use wildcards.
- Implemented shared memory access.
- Major revamp in code structure.
- Prepared statements now working for MySql 4.1.1 and later.
- Finished implementing auth for 4.0, 4.1.0, and 4.1.1.
- Changed namespace from `MySQL.Data.MySQLClient` back to `MySql.Data.MySqlClient`.
- Fixed bug in `CharSetMapping` where it was trying to use text names as ints.
- Changed namespace to `MySQL.Data.MySQLClient`.
- Integrated auth changes from UC2004.
- Fixed bug where calling any of the GetXXX methods on a datareader before or after reading data would not throw the appropriate exception (thanks Luca Morelli).
- Added `TimeSpan` code in parameter.cs to properly serialize a timespan object to mysql time format (thanks Gianluca Colombo).
- Added `TimeStamp` to parameter serialization code. Prevented `DataAdapter` updates from working right (thanks Michael King).
- Fixed a misspelling in `MySqlHelper.cs` (thanks Patrick Kristiansen).

Changes in MySQL Connector/Net Version 0.76

- Driver now using charset number given in handshake to create encoding.
- Changed command editor to point to `MySqlClient.Design`.
- Fixed bug in `Version.isAtLeast`.
- Changed `DBConnectionString` to support changes done to `MySqlConnectionString`.
- Removed `SqlCommandEditor` and `DataAdapterPreviewDialog`.
- Using new long return values in many places.
- Integrated new `CompressedStream` class.

- Changed `ConnectionString` and added attributes to permit it to be used in `MySqlClient.Design`.
- Changed `packet.cs` to support newer lengths in `ReadLenInteger`.
- Changed other classes to use new properties and fields of `MySqlConnectionString`.
- `ConnectionInternal` is now using PING to see whether the server is available.
- Moved toolbox bitmaps into resource folder.
- Changed `field.cs` to permit values to come directly from row buffer.
- Changed to use the new driver.Send syntax.
- Using a new packet queueing system.
- Started work handling the "broken" compression packet handling.
- Fixed bug in `StreamCreator` where failure to connect to a host would continue to loop infinitely (thanks Kevin Casella).
- Improved connectstring handling.
- Moved designers into Pro product.
- Removed some old commented out code from `command.cs`.
- Fixed a problem with compression.
- Fixed connection object where an exception throw prior to the connection opening would not leave the connection in the connecting state (thanks Chris Cline).
- Added GUID support.
- Fixed sequence out of order bug (thanks Mark Reay).

Changes in MySQL Connector/Net Version 0.75

- Enum values now supported as parameter values (thanks Philipp Sumi).
- Year data type now supported.
- Fixed compression.
- Fixed bug where a parameter with a `TimeSpan` as the value would not serialize properly.
- Fixed bug where default constructor would not set default connection string values.
- Added some XML comments to some members.
- Work to fix/improve compression handling.
- Improved `ConnectionString` handling so that it better matches the standard set by `SqlClient`.
- A `MySqlException` is now thrown if a user name is not included in the connection string.
- Localhost is now used as the default if not specified on the connection string.
- An exception is now thrown if an attempt is made to set the connection string while the connection is open.
- Small changes to `ConnectionString` docs.
- Removed `MultiHostStream` and `MySqlStream`. Replaced it with `Common/StreamCreator`.

- Added support for Use Pipe connection string value.
- Added Platform class for easier access to platform utility functions.
- Fixed small pooling bug where new connection was not getting created after `IsAlive` fails.
- Added `Platform.cs` and `StreamCreator.cs`.
- Fixed `Field.cs` to properly handle 4.1 style timestamps.
- Changed `Common.Version` to `Common.DBVersion` to avoid name conflict.
- Fixed `field.cs` so that text columns return the right field type.
- Added `MySqlError` class to provide some reference for error codes (thanks Geert Veenstra).

Changes in MySQL Connector/Net Version 0.74

- Added Unix socket support (thanks Mohammad DAMT).
- Only calling `Thread.Sleep` when no data is available.
- Improved escaping of quote characters in parameter data.
- Removed misleading comments from `parameter.cs`.
- Fixed pooling bug.
- Fixed `ConnectionString` editor dialog (thanks marco p (pomarc)).
- `UserId` now supported in connection strings (thanks Jeff Neeley).
- Attempting to create a parameter that is not input throws an exception (thanks Ryan Gregg).
- Added much documentation.
- Checked in new `MultiHostStream` capability. Big thanks to Dan Guisinger for this. he originally submitted the code and idea of supporting multiple machines on the connect string.
- Added a lot of documentation.
- Fixed speed issue with 0.73.
- Changed to Thread.Sleep(0) in MySqlDataStream to help optimize the case where it doesn't need to wait (thanks Todd German).
- Prepopulating the idlepools to `MinPoolSize`.
- Fixed `MySqlPool` deadlock condition as well as stupid bug where CreateNewPooledConnection was not ever adding new connections to the pool. Also fixed `MySqlStream.ReadBytes` and `ReadByte` to not use `TicksPerSecond` which does not appear to always be right. (thanks Matthew J. Peddlesden)
- Fix for precision and scale (thanks Matthew J. Peddlesden).
- Added `Thread.Sleep(1)` to stream reading methods to be more cpu friendly (thanks Sean McGinnis).
- Fixed problem where `ExecuteReader` would sometime return null (thanks Lloyd Dupont).
- Fixed major bug with null field handling (thanks Naucki).
- Enclosed queries for `max_allowed_packet` [493] and `characterset` inside try catch (and set defaults).

- Fixed problem where socket was not getting closed properly (thanks Steve!).
- Fixed problem where `ExecuteNonQuery` was not always returning the right value.
- Fixed `InternalConnection` to not use `@@session.max_allowed_packet` but use `@@max_allowed_packet`. (Thanks Miguel)
- Added many new XML doc lines.
- Fixed SQL parsing to not send empty queries (thanks Rory).
- Fixed problem where the reader was not unpeeking the packet on close.
- Fixed problem where user variables were not being handled (thanks Sami Vaaraniemi).
- Fixed loop checking in the MySqlPool (thanks Steve M. Brown)
- Fixed `ParameterCollection.Add` method to match `SqlClient` (thanks Joshua Mouch).
- Fixed `ConnectionString` parsing to handle no and yes for boolean and not lowercase values (thanks Naucki).
- Added `InternalConnection` class, changes to pooling.
- Implemented Persist Security Info.
- Added `security.cs` and `version.cs` to project
- Fixed `DateTime` handling in `Parameter.cs` (thanks Burkhard Perkens-Golomb).
- Fixed parameter serialization where some types would throw a cast exception.
- Fixed `DataReader` to convert all returned values to prevent casting errors (thanks Keith Murray).
- Added code to `Command.ExecuteReader` to return null if the initial SQL statement throws an exception (thanks Burkhard Perkens-Golomb).
- Fixed `ExecuteScalar` bug introduced with restructure.
- Restructure to permit `LOCAL DATA INFILE` and better sequencing of packets.
- Fixed several bugs related to restructure.
- Early work done to support more secure passwords in MySQL 4.1. Old passwords in 4.1 not supported yet.
- Parameters appearing after system parameters are now handled correctly (Adam M. (adammil)).
- Strings can now be assigned directly to blob fields (Adam M.).
- Fixed float parameters (thanks Pent).
- Improved Parameter constructor and `ParameterCollection.Add` methods to better match SqlClient (thanks Joshua Mouch).
- Corrected `Connection.CreateCommand` to return a `MySqlCommand` type.
- Fixed connection string designer dialog box problem (thanks Abraham Guyt).
- Fixed problem with sending commands not always reading the response packet (thanks Joshua Mouch).
- Fixed parameter serialization where some blobs types were not being handled (thanks Sean McGinnis).
- Removed spurious `MessageBox.show` from `DataReader` code (thanks Joshua Mouch).

- Fixed a nasty bug in the split SQL code (thanks everyone!).

Changes in MySQL Connector/Net Version 0.71

- Fixed bug in `MySqlStream` where too much data could attempt to be read (thanks Peter Belbin)
- Implemented `HasRows` (thanks Nash Pherson).
- Fixed bug where tables with more than 252 columns cause an exception (thanks Joshua Kessler).
- Fixed bug where SQL statements ending in ; would cause a problem (thanks Shane Krueger).
- Fixed bug in driver where error messages were getting truncated by 1 character (thanks Shane Krueger).
- Made `MySqlException` serializable (thanks Mathias Hasselmann).

Changes in MySQL Connector/Net Version 0.70

- Updated some of the character code pages to be more accurate.
- Fixed problem where readers could be opened on connections that had readers open.
- Moved test to separate assembly `MySqlClientTests`.
- Fixed stupid problem in driver with sequence out of order (Thanks Peter Belbin).
- Added some pipe tests.
- Increased default max pool size to 50.
- Compiles with Mono 0-24.
- Fixed connection and data reader dispose problems.
- Added `String` data type handling to parameter serialization.
- Fixed sequence problem in driver that occurred after thrown exception (thanks Burkhard Perkens-Golomb).
- Added support for `CommandBehavior.SingleRow` to `DataReader`.
- Fixed command SQL processing so quotation marks are better handled (thanks Theo Spears).
- Fixed parsing of double, single, and decimal values to account for non-English separators. You still have to use the right syntax if you using hard coded SQL, but if you use parameters the code will convert floating point types to use '.' appropriately internal both into the server and out.
- Added `MySqlStream` class to simplify timeouts and driver coding.
- Fixed `DataReader` so that it is closed properly when the associated connection is closed. [thanks smishra]
- Made client more SqlClient compliant so that DataReaders have to be closed before the connection can be used to run another command.
- Improved `DBNull.Value` handling in the fields.
- Added several unit tests.
- Fixed `MySqlException` base class.
- Improved driver coding
- Fixed bug where NextResult was returning false on the last resultset.

- Added more tests for MySQL.
- Improved casting problems by equating unsigned 32bit values to Int64 and unsigned 16bit values to Int32, and so forth.
- Added new constructor for `MySqlParameter` for (name, type, size, srccol)
- Fixed bug in `MySqlDataReader` where it didn't check for null fieldlist before returning field count.
- Started adding `MySqlClient` unit tests (added `MySqlClient/Tests` folder and some test cases).
- Fixed some things in Connection String handling.
- Moved `INIT_DB` to `MySqlPool`. I may move it again, this is in preparation of the conference.
- Fixed bug inside `CommandBuilder` that prevented inserts from happening properly.
- Reworked some of the internals so that all three execute methods of Command worked properly.
- Fixed many small bugs found during benchmarking.
- The first cut of `CoonectionPooling` is working. "min pool size" and "max pool size" are respected.
- Work to enable multiple resultsets to be returned.
- Character sets are handled much more intelligently now. The driver queries MySQL at startup for the default character set. That character set is then used for conversions if that code page can be loaded. If not, then the default code page for the current OS is used.
- Added code to save the inferred type in the name,value constructor of `Parameter`.
- Also, inferred type if value of null parameter is changed using `Value` property.
- Converted all files to use proper Camel case. MySQL is now MySql in all files. PgSQL is now PgSql.
- Added attribute to PgSql code to prevent designer from trying to show.
- Added `MySQLDbType` property to Parameter object and added proper conversion code to convert from `DbType` to `MySQLDbType`).
- Removed unused `ObjectToString` method from `MySQLParameter.cs`.
- Fixed `Add(..)` method in `ParameterCollection` so that it doesn't use `Add(name, value)` instead.
- Fixed `IndexOf` and `Contains` in `ParameterCollection` to be aware that parameter names are now stored without @.
- Fixed `Command.ConvertSQLToBytes` so it only permits characters that can be in MySQL variable names.
- Fixed `DataReader` and `Field` so that blob fields read their data from `Field.cs` and `GetBytes` works right.
- Added simple query builder editor to `CommandText` property of `MySQLCommand`.
- Fixed `CommandBuilder` and `Parameter` serialization to account for Parameters not storing @ in their names.
- Removed `MySQLFieldType` enum from Field.cs. Now using `MySQLDbType` enum.
- Added `Designer` attribute to several classes to prevent designer view when using VS.Net.
- Fixed Initial catalog typo in `ConnectionString` designer.

- Removed 3 parameter constructor for `MySQLParameter` that conflicted with (name, type, value).
- Changed `MySQLParameter` so `paramName` is now stored without leading @ (this fixed null inserts when using designer).
- Changed `TypeConverter` for `MySQLParameter` to use the constructor with all properties.

Changes in MySQL Connector/Net Version 0.68

- Fixed sequence issue in driver.
- Added `DbParametersEditor` to make parameter editing more like `SqlClient`.
- Fixed `Command` class so that parameters can be edited using the designer
- Update connection string designer to support `Use Compression` flag.
- Fixed string encoding so that European characters will work correctly.
- Creating base classes to aid in building new data providers.
- Added support for UID key in connection string.
- Field, parameter, command now using DBNull.Value instead of null.
- `CommandBuilder` using `DBNull.Value`.
- `CommandBuilder` now builds insert command correctly when an auto_insert field is not present.
- Field now uses typeof keyword to return `System.Types` (performance).

Changes in MySQL Connector/Net Version 0.65

- `MySQLCommandBuilder` now implemented.
- Transaction support now implemented (not all table types support this).
- `GetSchemaTable` fixed to not use xsd (for Mono).
- Driver is now Mono-compatible.
- TIME data type now supported.
- More work to improve Timestamp data type handling.
- Changed signatures of all classes to match corresponding `SqlClient` classes.

Changes in MySQL Connector/Net Version 0.60

- Protocol compression using SharpZipLib (www.icsharpcode.net).
- Named pipes on Windows now working properly.
- Work done to improve `Timestamp` data type handling.
- Implemented `IEnumerable` on `DataReader` so `DataGrid` would work.

Changes in MySQL Connector/Net Version 0.50

- Speed increased dramatically by removing bugging network sync code.
- Driver no longer buffers rows of data (more ADO.Net compliant).
- Conversion bugs related to `TIMESTAMP` and `DATETIME` fields fixed.

MySQL Visual Studio Plugin Change History

Note

As of Connector/Net 5.1.2 (14 June 2007), the Visual Studio Plugin is part of the main Connector/Net package. For the change history for the Visual Studio Plugin, see MySQL Connector/Net Change History.

Changes in MySQL Visual Studio Plugin 1.0.3 (Not yet released)

Bugs Fixed

- DataSet wizard would show all tables instead of only the tables available within the selected database. (Bugs #26348)
- Running queries based on a stored procedure would cause the data set designer to terminate. (Bugs #26364)

Changes in MySQL Visual Studio Plugin 1.0.2 (Not yet released)

Version 1.0.2 has no changelog entries.

Changes in MySQL Visual Studio Plugin 1.0.1 (2006-10-04)

This is a bug fix release to resolve an incompatibility issue with Connector/Net 5.0.1.

It is critical that this release only be used with Connector/Net 5.0.1. After installing Connector/Net 5.0.1, you will need to make a small change in your machine.config file. This file should be located at `%win%\Microsoft.Net\Framework\v2.0.50727\CONFIG\machine.config` (`%win%` should be the location of your Windows folder). Near the bottom of the file you will see a line like this:

```
<add name="MySQL Data Provider" invariant="MySql.Data.MySqlClient"
description=".Net Framework Data Provider for MySQL"
type="MySql.Data.MySqlClient.MySqlClientFactory, MySql.Data"/>
```

It needs to be changed to be like this:

```
<add name="MySQL Data Provider" invariant="MySql.Data.MySqlClient"
description=".Net Framework Data Provider for MySQL"
type="MySql.Data.MySqlClient.MySqlClientFactory, MySql.Data,
Version=5.0.1.0, Culture=neutral, PublicKeyToken=c5687fc88969c44d"/>
```

Version 1.0.1 has no changelog entries.

Changes in MySQL Visual Studio Plugin 1.0.0 (2006-10-04)

Bugs Fixed

- DDEX (Data Designer Extensibility) compatibility.
- Ability to work with MySQL objects (tables, views, stored procedures, etc) from within Server Explorer.

MySQL Connector/J Change History

Changes in MySQL Connector/J 5.1.x

Changes in MySQL Connector/J 5.1.22 (2012-09-11)

Fixes bugs found since release 5.1.21.

Bugs Fixed

- **Performance**: The `com.mysql.jdbc.getCharsetNameForIndex()` method was made more efficient, resulting in better performance for queries against tables containing many columns with string data types. (Bug #14236302, Bug #65508)
- The `LoadBalancingConnectionProxy.pickNewConnection()` method could incorrectly flag the current connection as invalid after testing another connection. The selection process could choose another (potentially offline) host, leading to a “connection is closed” error when trying to use a connection after re-balancing:

  ```
  No operations allowed after connection closed.
  Connection closed after inability to pick valid new connection during fail-over.
  ```

  (Bug #14563127)
- With `profileSQL=true` and `useNanosForElapsedTime=true` specified in the connection URL, query and fetch duration were not reported correctly. The `com.mysql.jdbc.MysqlIO.sqlQueryDirect()` method always measured times in milliseconds rather than switching between milliseconds and nanoseconds. (Bug #14273046, Bug #57662)
- `ResultSet` objects created by the `getGeneratedKeys()` method were not being automatically closed, leading to potential memory leaks if the application did not explicitly close the `ResultSet` objects. (Bug #14192873, Bug #65503)
- Implemented the `getVersionColumns()` method, which formerly always returned an empty result set. Now this method returns the timestamp columns that are updated every time a row is changed. (Bug #13636546, Bug #63800)
- Connecting to a server that used a `UCS2` character set would throw an exception:

  ```
  com.mysql.jdbc.exceptions.jdbc4.MySQLSyntaxErrorException: You have an error
  in your SQL syntax; check the manual that corresponds to your MySQL server
  version for the right syntax to use near '??' at line 1
  ```

  Now, Connector/J sets `characterEncoding` implicitly to `UTF-8` when the server character set is `UCS2`. Because the Connector/J UTF-8 implementation does not cover all UCS-2 characters, note that truncation might occur in some cases. (Bug #11751035, Bug #41752)

Changes in MySQL Connector/J 5.1.21 (2012-07-03)

Fixes bugs found since release 5.1.20.

Functionality Added or Changed

- Connector/J applications can now connect to MySQL servers that use the PAM authentication system. See Connecting Using PAM Authentication for details about the Connector/J support, and The PAM Authentication Plugin for information about this authentication feature of the MySQL server.

Bugs Fixed

- With a connection encoding of `gbk` and a server encoding of `latin1`, a call such as `PreparedStatement.setString(1, "0f0f0702")` could throw an exception `java.lang.StringIndexOutOfBoundsException`. (Bug #13943893, Bug #64731)
- When Connector/J was connected to a MySQL 5.5 server, the error message for an invalid query could be returned in the wrong character set and appear garbled. (Bug #13702427, Bug #64205)
- The timezone entry was missing for “MEST - Middle European Summer Time”. (Bug #11748548, Bug #36662)
- Specifying a non-existent character set in the `characterEncoding` or `characterSetResults` connection options could produce a `NullPointerException` error. The error could occur with a typographical mistake, such as using a hyphen instead of an underscore in the name. (Bug #11749010, Bug #37931)

Changes in MySQL Connector/J 5.1.20 (2012-05-01)

Fixes bugs found since release 5.1.19.

Bugs Fixed

- **Important Change**: This fix corrects an issue introduced in Connector/J 5.1.19 that caused connection errors with MySQL 4.1 and earlier servers. A `java.lang.ClassCastException` exception occurred during connection initialization when `com.mysql.jdbc.ConnectionImpl.buildCollationMapping()` interpreted the output of the `SHOW COLLATION` statement. (Bug #13958793)
- Using Connector/J 5.1.19 in combination with JBoss could result in an error while establishing a connection: `MySQLNonTransientConnectionException: Bad handshake`. This issue occurred when using the old-style password hash, which requires the `mysql_old_password` plugin during handshake. A workaround was to replace the 16-byte hash with a 41-byte one, as explained in Password Hashing in MySQL. (Bug #13990612, Bug #64983)
- A `java.lang.StringIndexOutOfBoundsException` exception could occur when manipulating date/time values with fractional seconds. (Bug #13960556)
- A `MySQLSyntaxErrorException` could occur when calling certain methods while connected to a MySQL 5.6.5 or higher server. Affected methods included `StatementImpl.execute()` and `PreparedStatement.execute()`. (Bug #13955027)
- The savepoint identifier generated by the `java.sql.Connection#.setSavepoint()` function could be misinterpreted as a floating-point number, for example values such as `123e10` or `123e10foo`. Such values could cause replication errors on slave servers because the values are not quoted in the binary log. The fix ensures that the savepoint identifiers do not begin with digits. (Bug #11763271, Bug #55962)
- If the string `limit` was used in a column name, prepared statements incorrectly treated the statement as if it used a `LIMIT` clause. For example, a prepared statement with `maxrows` set to 0 could incorrectly reuse the value from a previous call to `setMaxRows()`. This issue applied to both quoted and unquoted column names, and server-side and client-side prepared statements. (Bug #11748492, Bug #36478)

Changes in MySQL Connector/J 5.1.19 (April 2012)

Fixes bugs found since release 5.1.18.

Functionality Added or Changed

- Added support for pluggable authentication. via the `com.mysql.jdbc.AuthenticationPlugin` interface (which extends the standard “extension” interface). Examples are in `com/mysql/jdbc/authentication` and in `testsuite.regression.ConnectionRegressionTest.` This feature introduces three new connection properties:
  - `authenticationPlugins` defines a comma-delimited list of classes that implement `com.mysql.jdbc.AuthenticationPlugin` and are used for authentication unless disabled by the `disabledAuthenticationPlugins` property.
  - `disabledAuthenticationPlugins` defines a comma-delimited list of classes implementing `com.mysql.jdbc.AuthenticationPlugin` or mechanisms, i.e. `mysql_native_password`. The authentication plugins or mechanisms cannot be used for authentication. Authentication will fail if it requires one of these classes. It is an error to disable the default authentication plugin, either the one named by `defaultAuthenticationPlugin` property or the hardcoded one if `defaultAuthenticationPlugin` property is not set.
  - `defaultAuthenticationPlugin` defines the name of a class implementing `com.mysql.jdbc.AuthenticationPlugin`, which is used as the default authentication plugin.

It is an error to use a class that is not listed in `authenticationPlugins` and is not one of the built-in plugins. It is an error to set as default a plugin that is disabled by being listed in the `disabledAuthenticationPlugins` property. It is an error to set this value to null or the empty string; there must be at least one valid default authentication plugin specified for the connection, meeting all the constraints listed above.

Bugs Fixed

- Reduced the memory overhead for server-side prepared statements. Each prepared statement allocated a 4K buffer for converting streams. Now this allocation is skipped when no `set*Stream()` methods have been used.
- The `Connection.changeUser()` method did not check for closed connections, leading to `NullPointerException` errors when this method was called on a closed connection.

Changes in MySQL Connector/J 5.1.18 (2011-10-04)

Fixes bugs found since release 5.1.17.

Functionality Added or Changed

- Added the function `MYSQL_INDEX_TO_MYSQL_CHARSET` to retrieve the server charset name, using an index instead of parsing variables to `CharsetMapping.java`

Bugs Fixed

- The `LRUCache` implementation removed the eldest entry, rather than the least-recently accessed. (Bug #13036537)
- Changed `cacheCallableStatements` to `cacheCallableStmts` in `maxPerformance.properties`, to allow proper caching. (Bug #13036309)
- Added a new `ant` flag, `com.mysql.jdbc.junit.fork`, which controls whether `JUnit` will fork new processes.

  The value `on`: The default, and legacy behavior. Or `off`): Required for Windows, as otherwise `process fork failure` errors will result while running the test suite via `ant` on Windows. (Bug #12784170)
- Not putting a space between `VALUES()` [1044] and `ON DUPLICATE KEY UPDATE` causes connector/J to both (A) Rewrite the query, although it includes an `ON UPDATE` statement and (B) To generate the wrong query with multiple `ON DUPLICATE KEY` statements. (Bug #12565726)
- The `loadBalanceBlacklistTimeout` option was not functioning properly. Working connections were not being removed from the blacklist. (Bug #63135)
- Connector/J now guards against the condition where a call to `KILL QUERY` will kill the next query issued by the server, if no query is in process. (Bug #61501)
- The "old" warnings were returned when `Statement.getWarnings()` was called after `Statement.clearWarnings()`. (Bug #61866, Bug #12791594)
- Calling `Statement.cancel()` on a statement that isn't currently executing, will cause a later-executed query on the same connection to be unexpectedly canceled. The driver now guards against this condition, but it is an underlying server issue. The MySQL statement `KILL QUERY` (which is what the driver uses to implement `Statement.cancel()`) is rather non-deterministic, and thus the use of `Statement.cancel()` should be avoided if possible. (Bug #61501)
- A connection could not be established when the URL contained both `sessionVariables` and `characterEncoding`. (Bug #61201, Bug #12649557)
- Reverting changes made to `ConnectionImpl.java`, the `private boolean characterSetNamesMatches` function.

Changes in MySQL Connector/J 5.1.17 (2011-07-07)

Fixes bugs found since release 5.1.16.

Bugs Fixed

- `LIKE` [959] was not optimized in then server when run against `INFORMATION_SCHEMA` tables and no wildcards were used. Databases/tables with `'_'` or `'%'` in their names (escaped or not) are handled by this code path, although slower, since it is rare to find these characters in table names in SQL. If there is a `'_'` or `'%'` in the string, `LIKE` [959] takes care of that; otherwise, `'='` is now used instead. The only exception is the `information_schema` database, which is handled separately. The patch covers both `getTables()` and `getColumns()`. (Bug #61332)
- The first call to a stored procedure failed with “No Database Selected”. The workaround introduced in `DatabaseMetaData.getCallStmtParameterTypes` to fix the server bug where `SHOW CREATE PROCEDURE` was not respecting lowercase table names was misbehaving when the connection was not attached to a database and on case-insensitive operating systems. (Bug #61150)
- There was a concurrency bottleneck in Java's character set encoding/decoding when converting bytes to/from `String` values.

  Important

  No longer use `String.getBytes(...)`, or `new String(byte[]...)`. Use the `StringUtils` method instead.

  (Bug #61105)

Changes in MySQL Connector/J 5.1.16 (Not released)

Fixes bugs found since release 5.1.15.

Functionality Added or Changed

- The `Connection.isServerLocal()` method can now determine if a connection is against a server on the same host.

Changes in MySQL Connector/J 5.1.15 (2011-02-09)

Fixes bugs found since release 5.1.14.

Bugs Fixed

- Optional logging class `com.mysql.jdbc.log.Log4JLogger` was not included in the source/binary package for 5.1.14.

  5.1.15 will ship with an SLF4J logger (which can then be plugged into Log4J). Unfortunately, it is not possible to ship a direct Log4J integration because the GPL is not compatible with Log4J's license. (Bug #59511, Bug #11766408)
- The hard-coded list of reserved words in Connector/J was not updated to reflect the list of reserved words in MySQL Server 5.5. (Bug #59224)
- MySqlProcedure accepted null arguments as parameters, however the JDBC meta data did not indicate that. (Bug #38367, Bug #11749186)
- Using Connector/J to connect from a z/OS machine to a MySQL Server failed when the database name to connect to was included in the connection URL. This was because the name was sent in z/OS default platform encoding, but the MySQL Server expected Latin1.

  It should be noted that when connecting from systems that do not use Latin1 as the default platform encoding, the following connection string options can be useful:

passwordCharacterEncoding=ASCII and characterEncoding=ASCII. (Bug #18086, Bug #11745647)

Changes in MySQL Connector/J 5.1.14 (6th December 2010)

Fixes bugs found since release 5.1.13.

Version 5.1.14 has no changelog entries.

Changes in MySQL Connector/J 5.1.13 (2010-06-24)

Fixes bugs found since release 5.1.12.

Functionality Added or Changed

- Connector/J did not support utf8mb4 for servers 5.5.2 and newer.

  Connector/J now auto-detects servers configured with character_set_server=utf8mb4 or treats the Java encoding utf-8 passed using characterEncoding=... as utf8mb4 in the SET NAMES= calls it makes when establishing the connection. (Bug #54175)

Bugs Fixed

- When the allowMultiQueries connection string option was set to true, a call to Statement.executeBatch() scanned the query for escape codes, even though setEscapeProcessing(false) had been called previously. (Bug #51704)
- The method unSafeStatementInterceptors() contained an erroneous line of code, which resulted in the interceptor being called, but the result being thrown away. (Bug #53041)
- There was a performance regression of roughly 25% between r906 and r907, which appeared to be caused by pushing the Proxy down to the I/O layer. (Bug #52534)
- In the file DatabaseMetadata.java, the function private void getCallStmtParameterTypes failed if the parameter was defined over more than one line by using the '\n' character. (Bug #52167)
- The catalog parameter, PARAM_CAT, was not correctly processed when calling for metadata with getMetaData() on stored procedures. This was because PARAM_CAT was hardcoded in the code to NULL. In the case where nullcatalogmeanscurrent was true, which is its default value, a crash did not occur, but the metadata returned was for the stored procedures from the catalog currently attached to. If, however, nullcatalogmeanscurrent was set to false then a crash resulted.

  Connector/J has been changed so that when NULL is passed as PARAM_CAT it will not crash when nullcatalogmeanscurrent is false, but rather iterate all catalogs in search of stored procedures. This means that PARAM_CAT is no longer hardcoded to NULL (see Bug #51904). (Bug #51912)
- Logic in implementations of LoadBalancingConnectionProxy and LoadBalanceStrategy behaved differently as to which SQLExceptions trigger failover to a new host. The former looked at the first two characters of the SQLState:

```
if (sqlState.startsWith("08"))
...
```

  The latter used a different test:

```
if (sqlEx instanceof CommunicationsException
  || "08S01".equals(sqlEx.getSQLState())) {
...
```

  This meant it was possible for a new Connection object to throw an Exception when the first selected host was unavailable. This happened because MySqlIO.createNewIO() could throw

an `SQLException` with a `SQLState` of “08001”, which did not trigger the “try another host” logic in the `LoadBalanceStrategy` implementations, so an `Exception` was thrown after having only attempted connecting to a single host. (Bug #52231)

- A load balanced `Connection` object with multiple open underlying physical connections rebalanced on `commit()`, `rollback()`, or on a communication exception, without validating the existing connection. This caused a problem when there was no pinging of the physical connections, using queries starting with “/* ping */”, to ensure they remained active. This meant that calls to `Connection.commit()` could throw a `SQLException`. This did not occur when the transaction was actually committed; it occurred when the new connection was chosen and the driver attempted to set the auto-commit or transaction isolation state on the newly chosen physical connection. (Bug #51783)

- The `rollback()` method could fail to rethrow a `SQLException` if the server became unavailable during a rollback. The errant code only rethrew when `ignoreNonTxTables` was true and the exception did not have the error code 1196, `SQLError.ER_WARNING_NOT_COMPLETE_ROLLBACK`. (Bug #51776)

- Objects created by `ConnectionImpl`, such as prepared statements, hold a reference to the `ConnectionImpl` that created them. However, when the load balancer picked a new connection, it did not update the reference contained in, for example, the `PreparedStatement`. This resulted in inserts and updates being directed to invalid connections, while commits were directed to the new connection. This resulted in silent data loss. (Bug #51643)

- When a `StatementInterceptor` was used and an alternate `ResultSet` was returned from `preProcess()`, the original statement was still executed. (Bug #51666)

- `jdbc:mysql:loadbalance://` would connect to the same host, even though `loadBalanceStrategy` was set to a value of `random`, and multiple hosts were specified. (Bug #51266)

- An unexpected exception when trying to register `OUT` parameters in `CallableStatement`.

  Sometimes Connector/J was not able to register `OUT` parameters for `CallableStatements`. (Bug #43576)

Changes in MySQL Connector/J 5.1.12 (2010-02-18)

Fixes bugs found since release 5.1.11.

Bugs Fixed

- The catalog parameter was ignored in the `DatabaseMetaData.getProcedure()` method. It returned all procedures in all databases. (Bug #51022)

- A call to `DatabaseMetaData.getDriverVersion()` returned the revision as `mysql-connector-java-5.1.11 ( Revision: ${svn.Revision} )`. The variable `${svn.Revision}` was not replaced by the SVN revision number. (Bug #50288)

Changes in MySQL Connector/J 5.1.11 (2010-01-21)

Fixes bugs found since release 5.1.10.

Functionality Added or Changed

- Replication connections, those with URLs that start with jdbc:mysql:replication, now use a jdbc:mysql:loadbalance connection for the slave pool. This means that it is possible to set load balancing properties such as `loadBalanceBlacklistTimeout` and `loadBalanceStrategy` to choose a mechanism for balancing the load, and failover or fault tolerance strategy for the slave pool. (Bug #49537)

Bugs Fixed

- `NullPointerException` sometimes occurred in `invalidateCurrentConnection()` for load-balanced connections. (Bug #50288)
- For pooled connections, Connector/J did not process the session variable `time_zone` when set using the URL, resulting in incorrect timestamp values being stored. (Bug #49700)
- The `deleteRow` method caused a full table scan, when using an updatable cursor and a multi-byte character set. (Bug #49745)
- The `ExceptionInterceptor` class did not provide a `Connection` context. (Bug #49607)
- Ping left closed connections in the liveConnections map, causing subsequent Exceptions when that connection was used. (Bug #48605)
- Using `MysqlConnectionPoolDataSource` with a load-balanced URL generated exceptions of type `ClassCastException`:

```
ClassCastException in MysqlConnectionPoolDataSource
Caused by: java.lang.ClassCastException: $Proxy0
   at
com.mysql.jdbc.jdbc2.optional.MysqlConnectionPoolDataSource.getPooledConnection(MysqlConne
ctionPoolDataSource.java:80)
```

```
java.lang.ClassCastException: $Proxy2
 at com.mysql.jdbc.jdbc2.optional.StatementWrapper.executeQuery(StatementWrapper.java:744)
```

  (Bug #48486)

- The implementation for load-balanced `Connection` used a proxy, which delegated method calls, including `equals()` and `hashCode()`, to underlying `Connection` objects. This meant that successive calls to `hashCode()` on the same object potentially returned different values, if the proxy state had changed such that it was utilizing a different underlying connection. (Bug #48442)
- The batch rewrite functionality attempted to identify the start of the `VALUES` list by looking for “VALUES ” (with trailing space). However, valid MySQL syntax permits `VALUES` to be followed by whitespace or an opening parenthesis:

```
INSERT INTO tbl VALUES
(1);

INSERT INTO tbl VALUES(1);
```

  Queries written with the above formats did not therefore gain the performance benefits of the batch rewrite. (Bug #48172)

- A PermGen memory leaked was caused by the Connector/J statement cancellation timer (`java.util.Timer`). When the application was unloaded the cancellation timer did not terminate, preventing the ClassLoader from being garbage collected. (Bug #36565)
- With the connection string option `noDatetimeStringSync` set to `true`, and server-side prepared statements enabled, the following exception was generated if an attempt was made to obtain, using `ResultSet.getString()`, a datetime value containing all zero components:

```
java.sql.SQLException: Value '0000-00-00' can not be represented as java.sql.Date
```

  (Bug #32525)

Changes in MySQL Connector/J 5.1.10 (2009-09-23)

Fixes bugs found since release 5.1.9.

Bugs Fixed

- The `DriverManager.getConnection()` method ignored a non-standard port if it was specified in the JDBC connection string. Connector/J always used the standard port 3306 for connection creation. For example, if the string was `jdbc:mysql://localhost:6777`, Connector/J would attempt to connect to port 3306, rather than 6777. (Bug #47494)

Changes in MySQL Connector/J 5.1.9 (2009-09-21)

Bugs Fixed

- When Connector/J encountered an error condition that caused it to create a `CommunicationsException`, it tried to build a friendly error message that helped diagnose what was wrong. However, if there had been no network packets received from the server, the error message contained the following incorrect text:

```
The last packet successfully received from the server was 1,249,932,468,916 milliseconds
ago.  The last packet sent successfully to the server was 0 milliseconds ago.
```

  (Bug #46637)

- In the class `com.mysql.jdbc.jdbc2.optional.SuspendableXAConnection`, which is used when `pinGlobalTxToPhysicalConnection=true`, there is a static map (XIDS_TO_PHYSICAL_CONNECTIONS) that tracks the Xid with the XAConnection, however this map was not populated. The effect was that the `SuspendableXAConnection` was never pinned to the real XA connection. Instead it created new connections on calls to `start`, `end`, `resume`, and `prepare`. (Bug #46925)

- When using the ON DUPLICATE KEY UPDATE functionality together with the rewriteBatchedStatements option set to true, an exception was generated when trying to execute the prepared statement:

```
INSERT INTO config_table (modified,id_) VALUES (?,?) ON DUPLICATE KEY UPDATE modified=?
```

  The exception generated was:

```
java.sql.SQLException: Parameter index out of range (3 > number of parameters, which is
2).
  at com.sag.etl.job.processors.JdbcInsertProcessor.flush(JdbcInsertProcessor.java:135)
......
Caused by: java.sql.SQLException: Parameter index out of range (3 > number of parameters,
which is 2).

  at com.sag.etl.job.processors.JdbcInsertProcessor.flush(JdbcInsertProcessor.java:131)
  ... 16 more
```

  (Bug #46788)

- Accessing result set columns by name after the result set had been closed resulted in a NullPointerException instead of a SQLException. (Bug #41484)

- The `getSuperTypes` method returned a result set with incorrect names for the first two columns. The name of the first column in the result set was expected to be `TYPE_CAT` and that of the second column `TYPE_SCHEM`. The method however returned the names as `TABLE_CAT` and `TABLE_SCHEM` for first and second column respectively. (Bug #44508)

- Calling `ResultSet.deleteRow()` on a table with a primary key of type `BINARY(8)` silently failed to delete the row, but only in some repeatable cases. The generated `DELETE` statement generated

corrupted part of the primary key data. Specifically, one of the bytes was changed from 0x90 to 0x9D, although the corruption appeared to be different depending on whether the application was run on Windows or Linux. (Bug #43759)

- SQLException for data truncation error gave the error code as 0 instead of 1265. (Bug #44324)
- `QueryTimeout` did not work for batch statements waiting on a locked table.

  When a batch statement was issued to the server and was forced to wait because of a locked table, Connector/J only terminated the first statement in the batch when the timeout was exceeded, leaving the rest hanging. (Bug #34555)

- The `parseURL` method in class `com.mysql.jdbc.Driver` did not work as expected. When given a URL such as “jdbc:mysql://www.mysql.com:12345/my_database” to parse, the property `PORT_PROPERTY_KEY` was found to be `null` and the `HOST_PROPERTY_KEY` property was found to be “www.mysql.com:12345”.

  Note

  Connector/J has been fixed so that it will now always fill in the `PORT` property (using 3306 if not specified), and the `HOST` property (using `localhost` if not specified) when `parseURL()` is called. The driver also parses a list of hosts into `HOST.n` and `PORT.n` properties as well as adding a property `NUM_HOSTS` for the number of hosts it has found. If a list of hosts is passed to the driver, `HOST` and `PORT` will be set to the values given by `HOST.1` and `PORT.1` respectively. This change has centralized and cleaned up a large section of code used to generate lists of hosts, both for load-balanced and fault tolerant connections and their tests.

  (Bug #32216)

- Attempting to delete rows using `ResultSet.deleteRow()` did not delete rows correctly. (Bug #27431)
- The `setDate` method silently ignored the Calendar parameter. The code was implemented as follows:

```
public void setDate(int parameterIndex, java.sql.Date x, Calendar cal) throws SQLException {
   setDate(parameterIndex, x);
}
```

  From reviewing the code it was apparent that the Calendar parameter `cal` was ignored. (Bug #23584)

Changes in MySQL Connector/J 5.1.8 (2009-07-16)

Bugs Fixed

- Calling `Connection.serverPreparedStatement()` variants that do not take result set type or concurrency arguments returned statements that produced result sets with incorrect defaults, namely `TYPE_SCROLL_SENSITIVE`. (Bug #45171)
- The reported milliseconds since the last server packets were received/sent was incorrect by a factor of 1000. For example, the following method call:

```
SQLError.createLinkFailureMessageBasedOnHeuristics(
(ConnectionImpl) this.conn,
System.currentTimeMillis() - 1000,
System.currentTimeMillis() - 2000,
e,
false);
```

  returned the following string:

```
The last packet successfully received from the server
was 2 milliseconds ago. The last packet sent successfully to the
server was 1 milliseconds ago.
```

(Bug #45419)

- The method `Statement.getGeneratedKeys()` did not return values for `UNSIGNED BIGINTS` with values greater than `Long.MAX_VALUE`.

  Unfortunately, because the server does not tell clients what TYPE the auto increment value is, the driver cannot consistently return BigIntegers for the result set returned from `getGeneratedKeys()`, it will only return them if the value is greater than `Long.MAX_VALUE`. If your application needs this consistency, it will need to check the class of the return value from `.getObject()` on the ResultSet returned by `Statement.getGeneratedKeys()` and if it is not a BigInteger, create one based on the `java.lang.Long` that is returned. (Bug #43196)

- A statement interceptor received the incorrect parameters when used with a batched statement. (Bug #39426)

- When using Connector/J 5.1.7 to connect to MySQL Server 4.1.18 the following error message was generated:

  ```
  Thu Dec 11 17:38:21 PST 2008 WARN: Invalid value {1} for server variable named {0},
  falling back to sane default of {2}
  ```

  This occurred with MySQL Server version that did not support `auto_increment_increment`. The error message should not have been generated. (Bug #41416)

- The `RETURN_GENERATED_KEYS` flag was being ignored. For example, in the following code the `RETURN_GENERATED_KEYS` flag was ignored:

  ```
  PreparedStatement ps = connection.prepareStatement("INSERT INTO table
    values(?,?)",PreparedStatement.RETURN_GENERATED_KEYS);
  ```

  (Bug #41448)

- Using Connector/J 5.1.6 the method `ResultSet.getObject` returned a `BYTE[]` for following:

  ```
  SELECT TRIM(rowid) FROM tbl
  ```

  Where `rowid` had a type of `INT(11) PRIMARY KEY AUTO_INCREMENT`.

  The expected return type was one of `CHAR`, `VARCHAR`, `CLOB`, however, a `BYTE[]` was returned.

  Further, adding `functionsNeverReturnBlobs=true` to the connection string did not have any effect on the return type. (Bug #38387)

- Connector/J generated an unhandled `StringIndexOutOfBoundsException`:

  ```
  java.lang.StringIndexOutOfBoundsException: String index out of range: -1
  at java.lang.String.substring(String.java:1938)
  at com.mysql.jdbc.EscapeProcessor.processTimeToken(EscapeProcessor.java:353)
  at com.mysql.jdbc.EscapeProcessor.escapeSQL(EscapeProcessor.java:257)
  at com.mysql.jdbc.StatementImpl.executeUpdate(StatementImpl.java:1546)
  at com.mysql.jdbc.StatementImpl.executeUpdate(StatementImpl.java:1524)
  ```

  (Bug #42253)

- When using `rewriteBatchedStatements=true` with:

  ```
  INSERT INTO table_name_values (...) VALUES (...)
  ```

  Query rewriting failed because “values” at the end of the table name was mistaken for the reserved keyword. The error generated was as follows:

```
testBug40439(testsuite.simple.TestBug40439)java.sql.BatchUpdateException: You have an
error in your SQL syntax; check the manual that corresponds to your MySQL server version
for the right syntax to use near 'values (2,'toto',2),(id,data, ordr) values
(3,'toto',3),(id,data, ordr) values (' at line 1

at sun.reflect.DelegatingMethodAccessorImpl.invoke(DelegatingMethodAccessorImpl.java:25)
at testsuite.simple.TestBug40439.main(TestBug40439.java:57)
```

(Bug #40439)

- Error message strings contained variable values that were not expanded. For example:

```
Mon Nov 17 11:43:18 JST 2008 WARN: Invalid value {1} for server variable named {0},
falling back to sane default of {2}
```

(Bug #40772)

- When accessing a result set column by name using `ResultSetImpl.findColumn()` an exception was generated:

```
java.lang.NullPointerException
at com.mysql.jdbc.ResultSetImpl.findColumn(ResultSetImpl.java:1103)
at com.mysql.jdbc.ResultSetImpl.getShort(ResultSetImpl.java:5415)
at org.apache.commons.dbcp.DelegatingResultSet.getShort(DelegatingResultSet.java:219)

at com.zimbra.soap.SoapEngine.dispatchRequest(SoapEngine.java:428)
at com.zimbra.soap.SoapEngine.dispatch(SoapEngine.java:285)
```

(Bug #41484)

- If there was an apostrophe in a comment in a statement that was being sent through Connector/J, the apostrophe was still recognized as a quote and put the state machine in `EscapeTokenizer` into the `inQuotes` state. This led to further parse errors.

  For example, consider the following statement:

```
String sql = "-- Customer's zip code will be fixed\n" +
  "update address set zip_code = 99999\n" +
  "where not regexp '^[0-9]{5}([[.-.]])?([0-9]{4})?$'";
```

  When passed through Connector/J, the `EscapeTokenizer` did not recognize that the first apostrophe was in a comment and thus set `inQuotes` to true. When that happened, the quote count was incorrect and thus the regular expression did not appear to be in quotation marks. With the parser not detecting that the regular expression was in quotation marks, the curly braces were recognized as escape sequences and were removed from the regular expression, breaking it. The server thus received SQL such as:

```
-- Customer's zip code will be fixed
update address set zip_code = '99999'
where not regexp '^[0-9]([[.-.]])?([0-9])?$'
```

  (Bug #41566)

- Using `useInformationSchema` with `DatabaseMetaData.getExportedKeys()` generated the following exception:

```
com.mysql.jdbc.exceptions.MySQLIntegrityConstraintViolationException: Column
'REFERENCED_TABLE_NAME' in where clause is ambiguous
```

```
...
at com.mysql.jdbc.PreparedStatement.executeInternal(PreparedStatement.java:1772)
at com.mysql.jdbc.PreparedStatement.executeQuery(PreparedStatement.java:1923)
at
com.mysql.jdbc.DatabaseMetaDataUsingInfoSchema.executeMetadataQuery(
DatabaseMetaDataUsingInfoSchema.java:50)
at
com.mysql.jdbc.DatabaseMetaDataUsingInfoSchema.getExportedKeys(
DatabaseMetaDataUsingInfoSchema.java:603)
```

(Bug #43714)

- The `SQLError.createLinkFailureMessageBasedOnHeuristics()` method created a message text for communication link failures. When certain conditions were met, this message included both “last packet sent” and “last packet received” information, but when those conditions were not met, only “last packet sent” information was provided.

  Information about when the last packet was successfully received should be provided in all cases. (Bug #44587)

- When `DatabaseMetaData.getProcedureColumns()` was called, the value for `LENGTH` was always returned as 65535, regardless of the column type (fixed or variable) or the actual length of the column.

  However, if you obtained the `PRECISION` value, this was correct for both fixed and variable length columns. (Bug #41269)

- The `DEFERRABILITY` column in database metadata result sets was expected to be of type `SHORT`. However, Connector/J returned it as `INTEGER`.

  This affected the following methods: `getImportedKeys()`, `getExportedKeys()`, `getCrossReference()`. (Bug #44867)

- The result set returned by `getIndexInfo()` did not have the format defined in the JDBC API specifications. The fourth column, `DATA_TYPE`, of the result set should be of type `BOOLEAN`. Connector/J however returns `CHAR`. (Bug #44869)

- The result set returned by `getTypeInfo()` did not have the format defined in the JDBC API specifications. The second column, `DATA_TYPE`, of the result set should be of type `INTEGER`. Connector/J however returns `SMALLINT`. (Bug #44868)

- The result set returned by `getColumns()` did not have the format defined in the JDBC API specifications. The fifth column, `DATA_TYPE`, of the result set should be of type `INTEGER`. Connector/J however returns `SMALLINT`. (Bug #44865)

- The result set returned by `getVersionColumns()` did not have the format defined in the JDBC API specifications. The third column, `DATA_TYPE`, of the result set should be of type `INTEGER`. Connector/J however returns `SMALLINT`. (Bug #44863)

- The result set returned by `getBestRowIdentifier()` did not have the format defined in the JDBC API specifications. The third column, `DATA_TYPE`, of the result set should be of type `INTEGER`. Connector/J however returns `SMALLINT`. (Bug #44862)

- Connector/J contains logic to generate a message text specifically for streaming result sets when there are `CommunicationsException` exceptions generated. However, this code was never reached.

  In the `CommunicationsException` code:

```
private boolean streamingResultSetInPlay = false;

public CommunicationsException(ConnectionImpl conn, long lastPacketSentTimeMs,
long lastPacketReceivedTimeMs, Exception underlyingException) {

this.exceptionMessage = SQLError.createLinkFailureMessageBasedOnHeuristics(conn,
```

```
      lastPacketSentTimeMs, lastPacketReceivedTimeMs, underlyingException,
      this.streamingResultSetInPlay);
```

`streamingResultSetInPlay` was always false, which in the following code in `SQLError.createLinkFailureMessageBasedOnHeuristics()` never being executed:

```
if (streamingResultSetInPlay) {
    exceptionMessageBuf.append(
    Messages.getString("CommunicationsException.ClientWasStreaming")); //$NON-NLS-1$
} else {
...
```

(Bug #44588)

- SQL injection was possible when using a string containing U+00A5 in a client-side prepared statement, and the character set being used was SJIS/Windows-31J. (Bug #41730)
- `Statement.getGeneratedKeys()` retained result set instances until the statement was closed. This caused memory leaks for long-lived statements, or statements used in tight loops. (Bug #44056)
- MySQL Connector/J 5.1.7 was slower than previous versions when the `rewriteBatchedStatements` option was set to `true`.

Note

The performance regression in `indexOfIgnoreCaseRespectMarker()`has been fixed. It has also been made possible for the driver to rewrite `INSERT` statements with `ON DUPLICATE KEY UPDATE` clauses in them, as long as the `UPDATE` clause contains no reference to `LAST_INSERT_ID()`, as that would cause the driver to return bogus values for `getGeneratedKeys()` invocations. This has resulted in improved performance over version 5.1.7.

(Bug #41532)

- `LoadBalancingConnectionProxy.doPing()` did not have blacklist awareness.

  `LoadBalancingConnectionProxy` implemented `doPing()` to ping all underlying connections, but it threw any exceptions it encountered during this process.

  With the global blacklist enabled, it catches these exceptions, adds the host to the global blacklist, and only throws an exception if all hosts are down. (Bug #43421)

- When connecting with `traceProtocol=true`, no trace data was generated for the server greeting or login request. (Bug #43070)
- When the MySQL Server was upgraded from 4.0 to 5.0, the Connector/J application then failed to connect to the server. This was because authentication failed when the application ran from EBCDIC platforms such as z/OS. (Bug #43071)
- A `ConcurrentModificationException` was generated in `LoadBalancingConnectionProxy`:

```
java.util.ConcurrentModificationException
 at java.util.HashMap$HashIterator.nextEntry(Unknown Source)
 at java.util.HashMap$KeyIterator.next(Unknown Source)

```

(Bug #42055)

- `PreparedStatement.addBatch()` did not check for all parameters being set, which led to inconsistent behavior in `executeBatch()`, especially when rewriting batched statements into multi-value `INSERT`s. (Bug #41161)

Changes in MySQL Connector/J 5.1.7 (2008-10-21)

Functionality Added or Changed

- When statements include `ON DUPLICATE UPDATE`, and `rewriteBatchedStatements` is set to true, batched statements are not rewritten into the form `INSERT INTO table VALUES (), (), ()`, instead the statements are executed sequentially.

Bugs Fixed

- When using `trustCertificateKeyStoreUrl` or `clientCertificateKeyStoreUrl`, an `IllegalStateException` was caused by an uninitialized `TrustManagerFactoryImpl` object. (Bug #11748637, Bug #36948, Bug #38192)
- `Statement.getGeneratedKeys()` returned two keys when using `ON DUPLICATE KEY UPDATE` and the row was updated, not inserted. (Bug #42309)
- When configuring the Java Replication Driver the last slave specified was never used. (Bug #39611)
- When using the replication driver with `autoReconnect=true`, Connector/J checks in `PreparedStatement.execute` (also called by `CallableStatement.execute`) to determine if the first character of the statement is an “S”, in an attempt to block all statements that are not read-only-safe, for example non-`SELECT` statements. However, this also blocked `CALL`s to stored procedures, even if the stored procedures were defined as `SQL READ DATA` or `NO SQL`. (Bug #40031)
- When the `LoadBalancingConnectionProxy` handles a `SQLException` with SQL state starting with “08”, it calls `invalidateCurrentConnection`, which in turn removes that `Connection` from `liveConnections` and the `connectionsToHostsMap`, but it did not add the host to the new global blacklist, if the global blacklist was enabled.

  There was also the possibility of a `NullPointerException` when trying to update stats, where `connectionsToHostsMap.get(this.currentConn)` was called:

  ```
  int hostIndex = ((Integer) this.hostsToListIndexMap.get(this.connectionsToHostsMap.get(this.currentConn)
  ```

  This could happen if a client tried to issue a rollback after catching a `SQLException` caused by a connection failure. (Bug #39784)
- When using the random load balancing strategy and starting with two servers that were both unavailable, an `IndexOutOfBoundsException` was generated when removing a server from the `whiteList`. (Bug #38782)
- With large result sets `ResultSet.findColumn` became a performance bottleneck. (Bug #39962)
- Connector/J ignored the value of the MySQL Server variable `auto_increment_increment` [1622]. (Bug #39956)
- When an `INSERT ON DUPLICATE KEY UPDATE` was performed, and the key already existed, the `affected-rows` value was returned as 1 instead of 0. (Bug #39352)
- Connector/J failed to parse `TIMESTAMP` strings for nanos correctly. (Bug #39911)
- Connector/J threw the following exception when using a read-only connection:

  ```
  java.sql.SQLException: Connection is read-only. Queries leading to data
  modification are not allowed.
  ```

  (Bug #38747)

- Connector/J was unable to connect when using a non-`latin1` password. (Bug #37570)
- The `useOldAliasMetadataBehavior` connection property was ignored. (Bug #35753)
- When `getGeneratedKeys()` was called on a statement that had not been created with `RETURN_GENERATED_KEYS`, no exception was thrown, and batched executions then returned erroneous values. (Bug #34185)
- The `loadBalance bestResponseTime` blacklists did not have a global state. (Bug #33861)
- Incorrect result is returned from `isAfterLast()` in streaming `ResultSet` when using `setFetchSize(Integer.MIN_VALUE)`. (Bug #35170)

Changes in MySQL Connector/J 5.1.6 (2008-03-07)

Functionality Added or Changed

- Multiple result sets were not supported when using streaming mode to return data. Both normal statements and the result sets from stored procedures now return multiple results sets, with the exception of result sets using registered `OUTPUT` parameters. (Bug #33678)
- Add the `verifyServerCertificate` property. If set to "false" the driver will not verify the server's certificate when `useSSL` is set to "true"

  When using this feature, the keystore parameters should be specified by the `clientCertificateKeyStore*` properties, rather than system properties, as the JSSE doesn't it straightforward to have a nonverifying trust store and the "default" key store.
- The profiler event handling has been made extensible using the `profilerEventHandler` connection property.
- XAConnections and datasources have been updated to the JDBC-4.0 standard.

Bugs Fixed

- Prepared statements from pooled connections caused a `NullPointerException` when `closed()` under JDBC-4.0. (Bug #35489)
- When `useServerPrepStmts=true` and slow query logging is enabled, the connector throws a `NullPointerException` when it encounters a slow query. (Bug #35666)
- The JDBC driver uses a different method for evaluating column names in `resultsetmetadata.getColumnName()` and when looking for a column in `resultset.getObject(columnName)`. This causes Hibernate to fail in queries where the two methods yield different results, for example in queries that use alias names:

  ```
  SELECT column AS aliasName from table
  ```

  (Bug #35150)
- `DatabaseMetaData.getColumns()` returns incorrect `COLUMN_SIZE` value for `SET` column. (Bug #36830)
- When trying to read `Time` values like “00:00:00” with `ResultSet.getTime(int)` an exception is thrown. (Bug #36051)
- When using the keyword “loadbalance” in the connection string and trying to perform load balancing between two databases, the driver appears to hang. (Bug #35660)
- JDBC data type getter method was changed to accept only column name, whereas previously it accepted column label. (Bug #35610)
- In calling a stored function returning a `bigint`, an exception is encountered beginning:

```
java.sql.SQLException: java.lang.NumberFormatException: For input string:
```

followed by the text of the stored function starting after the argument list. (Bug #35199)

- JDBC connection URL parameters is ignored when using `MysqlConnectionPoolDataSource`. (Bug #35810)
- Retrieving the server version information for an active connection could return invalid information if the default character encoding on the host was not ASCII compatible. (Bug #31192)
- `MysqlConnectionPoolDataSource` does not support `ReplicationConnection`. Notice that we implemented `com.mysql.jdbc.Connection` for `ReplicationConnection`, however, only accessors from ConnectionProperties are implemented (not the mutators), and they return values from the currently active connection. All other methods from `com.mysql.jdbc.Connection` are implemented, and operate on the currently active connection, with the exception of `resetServerState()` and `changeUser()`. (Bug #34937)
- When calling `isValid()` on an active connection, if the timeout is nonzero then the `Connection` is invalidated even if the `Connection` is valid. (Bug #34703)
- When retrieving the column type name of a geometry field, the driver would return `UNKNOWN` instead of `GEOMETRY`. (Bug #34194)
- The internal class `ResultSetInternalMethods` referenced the nonpublic class `com.mysql.jdbc.CachedResultSetMetaData`. (Bug #33823)
- `ResultSet.getTimestamp()` would throw a `NullPointerException` instead of a `SQLException` when called on an empty `ResultSet`. (Bug #33162)
- `ResultSet.getTimestamp()` returns incorrect values for month/day of `TIMESTAMP`s when using server-side prepared statements (not enabled by default). (Bug #34913)
- `RowDataStatic` doesn't always set the metadata in `ResultSetRow`, which can lead to failures when unpacking `DATE`, `TIME`, `DATETIME` and `TIMESTAMP` types when using absolute, relative, and previous result set navigation methods. (Bug #34762)
- It was not possible to truncate a `BLOB` using `Blog.truncate()` when using 0 as an argument. (Bug #34677)
- Statements with batched values do not return correct values for `getGeneratedKeys()` when `rewriteBatchedStatements` is set to `true`, and the statement has an `ON DUPLICATE KEY UPDATE` clause. (Bug #34093)
- A `NullPointerException` could be raised when using client-side prepared statements and enabled the prepared statement cache using the `cachePrepStmts`. (Bug #33734)
- When using a cursor fetch for a statement, the internal prepared statement could cause a memory leak until the connection was closed. The internal prepared statement is now deleted when the corresponding result set is closed. (Bug #34518)
- Using server side cursors and cursor fetch, the table metadata information would return the data type name instead of the column name. (Bug #33594)
- `ResultSet` returned by `Statement.getGeneratedKeys()` is not closed automatically when statement that created it is closed. (Bug #30508)
- Load balancing connection using best response time would incorrectly "stick" to hosts that were down when the connection was first created.

  We solve this problem with a black list that is used during the picking of new hosts. If the black list ends up including all configured hosts, the driver will retry for a configurable number of times (the

`retriesAllDown` configuration property, with a default of 120 times), sleeping 250ms between attempts to pick a new connection.

We've also went ahead and made the balancing strategy extensible. To create a new strategy, implement the interface `com.mysql.jdbc.BalanceStrategy` (which also includes our standard "extension" interface), and tell the driver to use it by passing in the class name using the `loadBalanceStrategy` configuration property. (Bug #32877)

- Using `CallableStatement.setNull()` on a stored function would throw an `ArrayIndexOutOfBounds` exception when setting the last parameter to null. (Bug #31823)
- When using a connection from `ConnectionPoolDataSource`, some `Connection.prepareStatement()` methods would return null instead of the prepared statement. (Bug #32101)
- `MysqlValidConnectionChecker` doesn't properly handle connections created using `ReplicationConnection`. (Bug #31790)
- During a Daylight Savings Time (DST) switchover, there was no way to store two timestamp/datetime values , as the hours end up being the same when sent as the literal that MySQL requires.

  Note that to get this scenario to work with MySQL (since it doesn't support per-value timezones), you need to configure your server (or session) to be in UTC, and tell the driver not to use the legacy date/time code by setting `useLegacyDatetimeCode` to "false". This will cause the driver to always convert to/from the server and client timezone consistently.

  This bug fix also fixes Bug #15604, by adding entirely new date/time handling code that can be switched on by `useLegacyDatetimeCode` being set to "false" as a JDBC configuration property. For Connector/J 5.1.x, the default is "true", in trunk and beyond it will be "false" (that is, the old date/time handling code will be deprecated) (Bug #32577, Bug #15604)
- When unpacking rows directly, we don't hand off error message packets to the internal method which decodes them correctly, so no exception is raised, and the driver than hangs trying to read rows that aren't there. This tends to happen when calling stored procedures, as normal SELECTs won't have an error in this spot in the protocol unless an I/O error occurs. (Bug #32246)
- Further fixes have been made to this bug in the event that a node is nonresponsive. Connector/J will now try a different random node instead of waiting for the node to recover before continuing. (Bug #31053)
- `DatabaseMetadata.getColumns()` doesn't return the correct column names if the connection character isn't UTF-8. A bug in MySQL server compounded the issue, but was fixed within the MySQL 5.0 release cycle. The fix includes changes to all the sections of the code that access the server metadata. (Bug #20491)
- Fixed `ResultSetMetadata.getColumnName()` for result sets returned from `Statement.getGeneratedKeys()` - it was returning null instead of "GENERATED_KEY" as in 5.0.x.

Changes in MySQL Connector/J 5.1.5 (2007-10-09)

New Features, Compared to the 5.0 Series of Connector/J

- JDBC-4.0 standardized unwrapping to interfaces that include vendor extensions.
- Support for JDBC-4.0 XML processing using JAXP interfaces to DOM, SAX and StAX.
- JDBC-4.0 support for setting per-connection client information (which can be viewed in the comments section of a query using `SHOW PROCESSLIST` on a MySQL server, or can be extended to support custom persistence of the information using a public interface).
- Support for JDBC-4.0 `NCHAR`, `NVARCHAR` and `NCLOB` types.

Functionality Added or Changed

- Added `autoSlowLog` configuration property, overrides `slowQueryThreshold*` properties, driver determines slow queries by those that are slower than 5 * stddev of the mean query time (outside the 96% percentile).

Bugs Fixed

- When a connection is in read-only mode, queries that are wrapped in parentheses were incorrectly identified DML statements. (Bug #28256)
- When calling `setTimestamp` on a prepared statement, the timezone information stored in the calendar object was ignored. This resulted in the incorrect `DATETIME` information being stored. The following example illustrates this:

```
Timestamp t = new Timestamp( cal.getTimeInMillis() );
ps.setTimestamp( N, t, cal );
```

(Bug #15604)

Changes in MySQL Connector/J 5.1.4 (Not Released)

Only released internally.

Version 5.1.4 has no changelog entries.

Changes in MySQL Connector/J 5.1.3 (2007-09-10)

New Features, Compared to the 5.0 Series of Connector/J

- JDBC-4.0 standardized unwrapping to interfaces that include vendor extensions.
- Support for JDBC-4.0 XML processing using JAXP interfaces to DOM, SAX and StAX.
- JDBC-4.0 support for setting per-connection client information (which can be viewed in the comments section of a query using `SHOW PROCESSLIST` on a MySQL server, or can be extended to support custom persistence of the information using a public interface).
- Support for JDBC-4.0 `NCHAR`, `NVARCHAR` and `NCLOB` types.

Functionality Added or Changed

- Connector/J now connects using an initial character set of `utf-8` solely for the purpose of authentication to permit user names or database names in any character set to be used in the JDBC connection URL. (Bug #29853)
- Setting `useBlobToStoreUTF8OutsideBMP` to `true` tells the driver to treat `[MEDIUM/LONG]BLOB` columns as `[LONG]VARCHAR` columns holding text encoded in UTF-8 that has characters outside the BMP (4-byte encodings), which MySQL server can't handle natively.

  Set `utf8OutsideBmpExcludedColumnNamePattern` to a regex so that column names matching the given regex will still be treated as `BLOBs` The regex must follow the patterns used for the `java.util.regex`package. The default is to exclude no columns, and include all columns.

  Set `utf8OutsideBmpIncludedColumnNamePattern` to specify exclusion rules to utf8OutsideBmpExcludedColumnNamePattern". The regex must follow the patterns used for the `java.util.regex` package.
- New methods on com.mysql.jdbc.Statement: `setLocalInfileInputStream()` and `getLocalInfileInputStream()`:
  - `setLocalInfileInputStream()` sets an `InputStream` instance that will be used to send data to the MySQL server for a `LOAD DATA LOCAL INFILE` statement rather than a

`FileInputStream` or `URLInputStream` that represents the path given as an argument to the statement.

This stream will be read to completion upon execution of a `LOAD DATA LOCAL INFILE` statement, and will automatically be closed by the driver, so it needs to be reset before each call to `execute*()` that would cause the MySQL server to request data to fulfill the request for `LOAD DATA LOCAL INFILE`.

If this value is set to `NULL`, the driver will revert to using a `FileInputStream` or `URLInputStream` as required.

- `getLocalInfileInputStream()` returns the `InputStream` instance that will be used to send data in response to a `LOAD DATA LOCAL INFILE` statement.

  This method returns `NULL` if no such stream has been set using `setLocalInfileInputStream()`.

- Errors encountered during `Statement`/`PreparedStatement`/`CallableStatement.executeBatch()` when `rewriteBatchStatements` has been set to `true` now return `BatchUpdateExceptions` according to the setting of `continueBatchOnError`.

  If `continueBatchOnError` is set to `true`, the update counts for the "chunk" that were sent as one unit will all be set to `EXECUTE_FAILED`, but the driver will attempt to process the remainder of the batch. You can determine which "chunk" failed by looking at the update counts returned in the `BatchUpdateException`.

  If `continueBatchOnError` is set to "false", the update counts returned will contain all updates up-to and including the failed "chunk", with all counts for the failed "chunk" set to `EXECUTE_FAILED`.

  Since MySQL doesn't return multiple error codes for multiple-statements, or for multi-value `INSERT`/`REPLACE`, it is the application's responsibility to handle determining which item(s) in the "chunk" actually failed.

- `Statement.setQueryTimeout()`s now affect the entire batch for batched statements, rather than the individual statements that make up the batch.

- JDBC-4.0 ease-of-development features including auto-registration with the `DriverManager` through the service provider mechanism, standardized Connection validity checks and categorized `SQLExceptions` based on recoverability/retry-ability and class of the underlying error.

- The driver will automatically adjust the server session variable `net_write_timeout` [506] when it determines its been asked for a "streaming" result, and resets it to the previous value when the result set has been consumed. (The configuration property is named `netTimeoutForStreamingResults`, with a unit of seconds, the value '0' means the driver will not try and adjust this value).

- Added experimental support for statement "interceptors" through the `com.mysql.jdbc.StatementInterceptor` interface, examples are in `com/mysql/jdbc/interceptors`. Implement this interface to be placed "in between" query execution, so that it can be influenced (currently experimental).

- The data (and how it is stored) for `ResultSet` rows are now behind an interface which enables us (in some cases) to allocate less memory per row, in that for "streaming" result sets, we re-use the packet used to read rows, since only one row at a time is ever active.

- The driver now picks appropriate internal row representation (whole row in one buffer, or individual byte[]s for each column value) depending on heuristics, including whether or not the row has `BLOB` or `TEXT` types and the overall row-size. The threshold for row size that will cause the driver to use a buffer rather than individual byte[]s is configured by the configuration property `largeRowSizeThreshold`, which has a default value of 2KB.

- Setting `rewriteBatchedStatements` to `true` now causes CallableStatements with batched arguments to be re-written in the form "CALL (...); CALL (...); ..." to send the batch in as few client/server round trips as possible.
- Added two configuration parameters:
  - `blobsAreStrings`: Should the driver always treat BLOBs as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
  - `functionsNeverReturnBlobs`: Should the driver always treat data from functions returning `BLOBs` as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.

Bugs Fixed

- `CallableStatement.executeBatch()` doesn't work when connection property `noAccessToProcedureBodies` has been set to `true`.

  The fix involves changing the behavior of `noAccessToProcedureBodies`,in that the driver will now report all parameters as `IN` parameters but permit callers to call registerOutParameter() on them without throwing an exception. (Bug #28689)
- NPE with null column values when `padCharsWithSpace` is set to true. (Bug #30851)
- `setObject(int, Object, int, int)` delegate in PreparedStatementWrapper delegates to wrong method. (Bug #30892)
- Closing a load-balanced connection would cause a `ClassCastException`. (Bug #29852)
- `DatabaseMetaData.getTypeInfo()` for the types `DECIMAL` and `NUMERIC` will return a precision of 254 for server versions older than 5.0.3, 64 for versions 5.0.3 to 5.0.5 and 65 for versions newer than 5.0.5. (Bug #28972)
- An `ArithmeticException` or `NullPointerException` would be raised when the batch had zero members and `rewriteBatchedStatements=true` when `addBatch()` was never called, or `executeBatch()` was called immediately after `clearBatch()`. (Bug #30550)
- Collation on `VARBINARY` column types would be misidentified. A fix has been added, but this fix only works for MySQL server versions 5.0.25 and newer, since earlier versions didn't consistently return correct metadata for functions, and thus results from subqueries and functions were indistinguishable from each other, leading to type-related bugs. (Bug #30664)
- Connection checker for JBoss didn't use same method parameters using reflection, causing connections to always seem "bad". (Bug #29106)
- Schema objects with identifiers other than the connection character aren't retrieved correctly in `ResultSetMetadata`. (Bug #27867)
- `Connection.getServerCharacterEncoding()` doesn't work for servers with version >= 4.1. (Bug #27182)
- `DatabaseMetaData.getColumns()` doesn't contain `SCOPE_*` or `IS_AUTOINCREMENT` columns. (Bug #27915)
- The automated SVN revisions in `DBMD.getDriverVersion()`. The SVN revision of the directory is now inserted into the version information during the build. (Bug #21116)
- Specifying a "validation query" in your connection pool that starts with "/* ping */" _exactly_ will cause the driver to instead send a ping to the server and return a fake result set (much lighter weight), and when using a ReplicationConnection or a LoadBalancedConnection, will send the ping across all active connections.

Changes in MySQL Connector/J 5.1.2 (2007-06-29)

This is a new Beta development release, fixing recently discovered bugs.

Functionality Added or Changed

- Setting the configuration property `rewriteBatchedStatements` to `true` will now cause the driver to rewrite batched prepared statements with more than 3 parameter sets in a batch into multi-statements (separated by ";") if they are not plain (that is, without `SELECT` or `ON DUPLICATE KEY UPDATE` clauses) `INSERT` or `REPLACE` statements.

Changes in MySQL Connector/J 5.1.1 (2007-06-22)

This is a new Alpha development release, adding new features and fixing recently discovered bugs.

Functionality Added or Changed

- **Incompatible Change**: Pulled vendor-extension methods of `Connection` implementation out into an interface to support `java.sql.Wrapper` functionality from `ConnectionPoolDataSource`. The vendor extensions are javadoc'd in the `com.mysql.jdbc.Connection` interface.

  For those looking further into the driver implementation, it is not an API that is used for pluggability of implementations inside our driver (which is why there are still references to `ConnectionImpl` throughout the code).

  We've also added server and client `prepareStatement()` methods that cover all of the variants in the JDBC API.

  `Connection.serverPrepare(String)` has been re-named to `Connection.serverPrepareStatement()` for consistency with `Connection.clientPrepareStatement()`.

- Setting `rewriteBatchedStatements` to `true` now causes `CallableStatements` with batched arguments to be re-written in the form `CALL (...); CALL (...); ...` to send the batch in as few client/server round trips as possible.

- See the sources (fully javadoc'd) for `com.mysql.jdbc.StatementInterceptor` for more details until we iron out the API and get it documented in the manual.

- Added experimental support for statement "interceptors" through the `com.mysql.jdbc.StatementInterceptor` interface, examples are in `com/mysql/jdbc/interceptors`.

  Implement this interface to be placed "in between" query execution, so that you can influence it. (currently experimental).

  `StatementInterceptors` are "chainable" when configured by the user, the results returned by the "current" interceptor will be passed on to the next on in the chain, from left-to-right order, as specified by the user in the JDBC configuration property `statementInterceptors`.

- Driver now picks appropriate internal row representation (whole row in one buffer, or individual byte[]s for each column value) depending on heuristics, including whether or not the row has `BLOB` or `TEXT` types and the overall row-size. The threshold for row size that will cause the driver to use a buffer rather than individual byte[]s is configured by the configuration property `largeRowSizeThreshold`, which has a default value of 2KB.

- Similar to `Connection`, we pulled out vendor extensions to `Statement` into an interface named `com.mysql.Statement`, and moved the `Statement` class into `com.mysql.StatementImpl`. The two methods (javadoc'd in `com.mysql.Statement` are `enableStreamingResults()`, which already existed, and `disableStreamingResults()` which sets the statement instance back to the fetch size and result set type it had before `enableStreamingResults()` was called.

- The data (and how it is stored) for `ResultSet` rows are now behind an interface which enables us (in some cases) to allocate less memory per row, in that for "streaming" result sets, we re-use the packet used to read rows, since only one row at a time is ever active.
- Externalized the descriptions of connection properties.
- Made it possible to retrieve prepared statement parameter bindings (to be used in `StatementInterceptors`, primarily).
- Row navigation now causes any streams/readers open on the result set to be closed, as in some cases we're reading directly from a shared network packet and it will be overwritten by the "next" row.

Changes in MySQL Connector/J 5.1.0 (2007-04-11)

This is the first public alpha release of the current Connector/J 5.1 development branch, providing an insight to upcoming features. Although some of these are still under development, this release includes the following new features and changes (in comparison to the current Connector/J 5.0 production release):

Important change: Due to a number of issues with the use of server-side prepared statements, Connector/J 5.0.5 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

To enable server-side prepared statements you must add the following configuration property to your connector string:

```
useServerPrepStmts=true
```

The default value of this property is `false` (that is, Connector/J does not use server-side prepared statements).

Note

The disabling of server-side prepared statements does not affect the operation of the connector. However, if you use the `useTimezone=true` connection option and use client-side prepared statements (instead of server-side prepared statements) you should also set `useSSPSCompatibleTimezoneShift=true`.

Functionality Added or Changed

- Added support for JDBC-4.0's `Wrapper` interface.
- `com.mysql.jdbc.java6.rtjar`: Full path to your Java-6 `rt.jar` file
- Added support for JDBC-4.0's client information. The backend storage of information provided using `Connection.setClientInfo()` and retrieved by `Connection.getClientInfo()` is pluggable by any class that implements the `com.mysql.jdbc.JDBC4ClientInfoProvider` interface and has a no-args constructor.

  The implementation used by the driver is configured using the `clientInfoProvider` configuration property (with a default of value of `com.mysql.jdbc.JDBC4CommentClientInfoProvider`, an implementation which lists the client information as a comment prepended to every query sent to the server).

  This functionality is only available when using Java-6 or newer.
- New feature—driver will automatically adjust session variable `net_write_timeout` [506] when it determines it has been asked for a "streaming" result, and resets it to the previous value when the result set has been consumed. (configuration property is named `netTimeoutForStreamingResults` value and has a unit of seconds, the value `0` means the driver will not try and adjust this value).

- Re-worked Ant buildfile to build JDBC-4.0 classes separately, as well as support building under Eclipse (since Eclipse can't mix/match JDKs).

  To build, you must set `JAVA_HOME` to J2SDK-1.4.2 or Java-5, and set the following properties on your Ant command line:

  - `com.mysql.jdbc.java6.javac`: Full path to your Java-6 `javac` executable
  - `com.mysql.jdbc.java6.rtjar`: Full path to your Java-6 `rt.jar` file
- Added support for JDBC-4.0's SQLXML interfaces.
- `com.mysql.jdbc.java6.javac`: Full path to your Java-6 `javac` executable
- Added support for JDBC-4.0's `NCLOB`, and `NCHAR`/`NVARCHAR` types.
- Added support for JDBC-4.0 categorized `SQLExceptions`.
- Refactored `CommunicationsException` into a JDBC-3.0 version, and a JDBC-4.0 version (which extends `SQLRecoverableException`, now that it exists).

Note

This change means that if you were catching `com.mysql.jdbc.CommunicationsException` in your applications instead of looking at the SQLState class of `08`, and are moving to Java 6 (or newer), you need to change your imports to that exception to be `com.mysql.jdbc.exceptions.jdbc4.CommunicationsException`, as the old class will not be instantiated for communications link-related errors under Java 6.

Changes in MySQL Connector/J 5.0.x

Changes in MySQL Connector/J 5.0.8 (2007-10-09)

Functionality Added or Changed

- Driver will now fall back to sane defaults for `max_allowed_packet` [493] and `net_buffer_length` [505] if the server reports them incorrectly (and will log this situation at `WARN` level, since it is actually an error condition).
- XAConnections now start in auto-commit mode (as per JDBC-4.0 specification clarification).
- `functionsNeverReturnBlobs`: Should the driver always treat data from functions returning `BLOBs` as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
- Added two configuration parameters:
  - `blobsAreStrings`: Should the driver always treat BLOBs as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
  - `functionsNeverReturnBlobs`: Should the driver always treat data from functions returning `BLOBs` as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
- `blobsAreStrings`: Should the driver always treat BLOBs as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.

Bugs Fixed

- Connections established using URLs of the form `jdbc:mysql:loadbalance://` weren't doing failover if they tried to connect to a MySQL server that was down. The driver now attempts

connections to the next "best" (depending on the load balance strategy in use) server, and continues to attempt connecting to the next "best" server every 250 milliseconds until one is found that is up and running or 5 minutes has passed.

If the driver gives up, it will throw the last-received `SQLException`. (Bug #31053)

- `CallableStatement.executeBatch()` doesn't work when connection property `noAccessToProcedureBodies` has been set to `true`.

  The fix involves changing the behavior of `noAccessToProcedureBodies`,in that the driver will now report all parameters as `IN` parameters but permit callers to call registerOutParameter() on them without throwing an exception. (Bug #28689)

- NPE with null column values when `padCharsWithSpace` is set to true. (Bug #30851)

- `setObject(int, Object, int, int)` delegate in PreparedStatementWrapper delegates to wrong method. (Bug #30892)

- Closing a load-balanced connection would cause a `ClassCastException`. (Bug #29852)

- `DatabaseMetaData.getTypeInfo()` for the types `DECIMAL` and `NUMERIC` will return a precision of 254 for server versions older than 5.0.3, 64 for versions 5.0.3 to 5.0.5 and 65 for versions newer than 5.0.5. (Bug #28972)

- An `ArithmeticException` or `NullPointerException` would be raised when the batch had zero members and `rewriteBatchedStatements=true` when `addBatch()` was never called, or `executeBatch()` was called immediately after `clearBatch()`. (Bug #30550)

- Collation on `VARBINARY` column types would be misidentified. A fix has been added, but this fix only works for MySQL server versions 5.0.25 and newer, since earlier versions didn't consistently return correct metadata for functions, and thus results from subqueries and functions were indistinguishable from each other, leading to type-related bugs. (Bug #30664)

- Connection checker for JBoss didn't use same method parameters using reflection, causing connections to always seem "bad". (Bug #29106)

- Cached metadata with `PreparedStatement.execute()` throws `NullPointerException`. (Bug #27412)

- `UNSIGNED` types not reported using `DBMD.getTypeInfo()`, and capitalization of type names is not consistent between `DBMD.getColumns()`, `RSMD.getColumnTypeName()` and `DBMD.getTypeInfo()`.

  This fix also ensures that the precision of `UNSIGNED MEDIUMINT` and `UNSIGNED BIGINT` is reported correctly using `DBMD.getColumns()`. (Bug #27916)

- When a connection is in read-only mode, queries that are wrapped in parentheses were incorrectly identified DML statements. (Bug #28256)

- Schema objects with identifiers other than the connection character aren't retrieved correctly in `ResultSetMetadata`. (Bug #27867)

- `Connection.getServerCharacterEncoding()` doesn't work for servers with version >= 4.1. (Bug #27182)

- `DatabaseMetaData.getColumns()` doesn't contain `SCOPE_*` or `IS_AUTOINCREMENT` columns. (Bug #27915)

- The automated SVN revisions in `DBMD.getDriverVersion()`. The SVN revision of the directory is now inserted into the version information during the build. (Bug #21116)

- Specifying a "validation query" in your connection pool that starts with "/* ping */" _exactly_ will cause the driver to instead send a ping to the server and return a fake result set (much lighter weight), and

when using a ReplicationConnection or a LoadBalancedConnection, will send the ping across all active connections.

Changes in MySQL Connector/J 5.0.7 (2007-07-20)

Functionality Added or Changed

- Added configuration property `useNanosForElapsedTime` - for profiling/debugging functionality that measures elapsed time, should the driver try to use nanoseconds resolution if available (requires JDK >= 1.5)?

Note

If `useNanosForElapsedTime` is set to `true`, and this property is set to "0" (or left default), then elapsed times will still be measured in nanoseconds (if possible), but the slow query threshold will be converted from milliseconds to nanoseconds, and thus have an upper bound of approximately 2000 milliseconds (as that threshold is represented as an integer, not a long).

- Added new debugging functionality - Setting configuration property `includeInnodbStatusInDeadlockExceptions` to `true` will cause the driver to append the output of `SHOW ENGINE INNODB STATUS` to deadlock-related exceptions, which will enumerate the current locks held inside InnoDB.
- `tcpTrafficClass` - Should the driver set traffic class or type-of-service fields? See the documentation for java.net.Socket.setTrafficClass() for more information.
- `tcpSndBuf` - Should the driver set SO_SND_BUF to the given value? The default value of '0', means use the platform default value for this property.
- Setting the configuration parameter `useCursorFetch` to `true` for MySQL-5.0+ enables the use of cursors that enable Connector/J to save memory by fetching result set rows in chunks (where the chunk size is set by calling setFetchSize() on a Statement or ResultSet) by using fully materialized cursors on the server.
- Added configuration properties to enable tuning of TCP/IP socket parameters:
  - `tcpNoDelay` - Should the driver set SO_TCP_NODELAY (disabling the Nagle Algorithm, default `true`)?
  - `tcpKeepAlive` - Should the driver set SO_KEEPALIVE (default `true`)?
  - `tcpRcvBuf` - Should the driver set SO_RCV_BUF to the given value? The default value of '0', means use the platform default value for this property.
  - `tcpSndBuf` - Should the driver set SO_SND_BUF to the given value? The default value of '0', means use the platform default value for this property.
  - `tcpTrafficClass` - Should the driver set traffic class or type-of-service fields? See the documentation for java.net.Socket.setTrafficClass() for more information.
- Setting `useDynamicCharsetInfo` to `false` now causes driver to use static lookups for collations as well (makes ResultSetMetadata.isCaseSensitive() much more efficient, which leads to performance increase for ColdFusion, which calls this method for every column on every table it sees, it appears).
- `tcpRcvBuf` - Should the driver set SO_RCV_BUF to the given value? The default value of '0', means use the platform default value for this property.
- Added configuration property `slowQueryThresholdNanos` - if `useNanosForElapsedTime` is set to `true`, and this property is set to a nonzero value the driver will use this threshold (in nanosecond units) to determine if a query was slow, instead of using millisecond units.

- `tcpNoDelay` - Should the driver set SO_TCP_NODELAY (disabling the Nagle Algorithm, default `true`)?
- Driver detects when it is running in a ColdFusion MX server (tested with version 7), and uses the configuration bundle `coldFusion`, which sets `useDynamicCharsetInfo` to `false` (see previous entry), and sets `useLocalSessionState` and autoReconnect to `true`.
- Give more information in EOFExceptions thrown out of MysqlIO (how many bytes the driver expected to read, how many it actually read, say that communications with the server were unexpectedly lost).
- `tcpKeepAlive` - Should the driver set SO_KEEPALIVE (default `true`)?
- The driver will now automatically set `useServerPrepStmts` to `true` when `useCursorFetch` has been set to `true`, since the feature requires server-side prepared statements to function.

Bugs Fixed

- Parser in client-side prepared statements eats character following '/' if it is not a multi-line comment. (Bug #28851)
- Parser in client-side prepared statements runs to end of statement, rather than end-of-line for '#' comments. Also added support for '--' single-line comments. (Bug #28956)
- Don't send any file data in response to LOAD DATA LOCAL INFILE if the feature is disabled at the client side. This is to prevent a malicious server or man-in-the-middle from asking the client for data that the client is not expecting. Thanks to Jan Kneschke for discovering the exploit and Andrey "Poohie" Hristov, Konstantin Osipov and Sergei Golubchik for discussions about implications and possible fixes. (Bug #29605)
- PreparedStatement.getMetaData() for statements containing leading one-line comments is not returned correctly.

  As part of this fix, we also overhauled detection of DML for `executeQuery()` and `SELECT`s for `executeUpdate()` in plain and prepared statements to be aware of the same types of comments. (Bug #28469)

Changes in MySQL Connector/J 5.0.6 (2007-05-15)

Functionality Added or Changed

- More intelligent initial packet sizes for the "shared" packets are used (512 bytes, rather than 16K), and initial packets used during handshake are now sized appropriately as to not require reallocation.
- Driver will now use `INSERT INTO ... VALUES (DEFAULT)`form of statement for updatable result sets for `ResultSet.insertRow()`, rather than pre-populating the insert row with values from `DatabaseMetaData.getColumns()`(which results in a `SHOW FULL COLUMNS` on the server for every result set). If an application requires access to the default values before `insertRow()` has been called, the JDBC URL should be configured with `populateInsertRowWithDefaultValues` set to `true`.

  This fix specifically targets performance issues with ColdFusion and the fact that it seems to ask for updatable result sets no matter what the application does with them.
- Fixed issue where a failed-over connection would let an application call `setReadOnly(false)`, when that call should be ignored until the connection is reconnected to a writable master unless `failoverReadOnly` had been set to `false`.
- `com.mysql.jdbc.[NonRegistering]Driver` now understands URLs of the format `jdbc:mysql:replication://` and `jdbc:mysql:loadbalance://` which will create a ReplicationConnection (exactly like when using `[NonRegistering]ReplicationDriver`) and an

experimental load-balanced connection designed for use with SQL nodes in a MySQL Cluster/NDB environment, respectively.

In an effort to simplify things, we're working on deprecating multiple drivers, and instead specifying different core behavior based upon JDBC URL prefixes, so watch for `[NonRegistering]ReplicationDriver` to eventually disappear, to be replaced with `com.mysql.jdbc[NonRegistering]Driver` with the new URL prefix.

- `random`: The driver will pick a random host for each request. This tends to work better than round-robin, as the randomness will somewhat account for spreading loads where requests vary in response time, while round-robin can sometimes lead to overloaded nodes if there are variations in response times across the workload.
- Give better error message when "streaming" result sets, and the connection gets clobbered because of exceeding `net_write_timeout` [506] on the server.
- New configuration property, `enableQueryTimeouts` (default `true`).

  When enabled, query timeouts set with `Statement.setQueryTimeout()` use a shared `java.util.Timer` instance for scheduling. Even if the timeout doesn't expire before the query is processed, there will be memory used by the `TimerTask` for the given timeout which won't be reclaimed until the time the timeout would have expired if it hadn't been cancelled by the driver. High-load environments might want to consider disabling this functionality. (this configuration property is part of the `maxPerformance` configuration bundle).
- Added configuration property `useDynamicCharsetInfo`. If set to `false` (the default), the driver will use a per-connection cache of character set information queried from the server when necessary, or when set to `true`, use a built-in static mapping that is more efficient, but isn't aware of custom character sets or character sets implemented after the release of the JDBC driver.

  Note

  This only affects the `padCharsWithSpace` configuration property and the `ResultSetMetaData.getColumnDisplayWidth()` method.
- When `useLocalSessionState` is set to `true` and connected to a MySQL-5.0 or later server, the JDBC driver will now determine whether an actual `commit` or `rollback` statement needs to be sent to the database when `Connection.commit()` or `Connection.rollback()` is called.

  This is especially helpful for high-load situations with connection pools that always call `Connection.rollback()` on connection check-in/check-out because it avoids a round-trip to the server.
- Added configuration property `padCharsWithSpace` (defaults to `false`). If set to `true`, and a result set column has the `CHAR` type and the value does not fill the amount of characters specified in the DDL for the column, the driver will pad the remaining characters with space (for ANSI compliance).
- `bestResponseTime`: The driver will route the request to the host that had the best response time for the previous transaction.
- Added an experimental load-balanced connection designed for use with SQL nodes in a MySQL Cluster/NDB environment (This is not for master-slave replication. For that, we suggest you look at `ReplicationConnection` or `lbpool`).

  If the JDBC URL starts with `jdbc:mysql:loadbalance://host-1,host-2,...host-n`, the driver will create an implementation of `java.sql.Connection` that load balances requests across a series of MySQL JDBC connections to the given hosts, where the balancing takes place after transaction commit.

  Therefore, for this to work (at all), you must use transactions, even if only reading data.

  Physical connections to the given hosts will not be created until needed.

The driver will invalidate connections that it detects have had communication errors when processing a request. A new connection to the problematic host will be attempted the next time it is selected by the load balancing algorithm.

There are two choices for load balancing algorithms, which may be specified by the `loadBalanceStrategy` JDBC URL configuration property:

- `random`: The driver will pick a random host for each request. This tends to work better than round-robin, as the randomness will somewhat account for spreading loads where requests vary in response time, while round-robin can sometimes lead to overloaded nodes if there are variations in response times across the workload.
- `bestResponseTime`: The driver will route the request to the host that had the best response time for the previous transaction.

Bugs Fixed

- When the configuration property `useCursorFetch` was set to `true`, sometimes server would return new, more exact metadata during the execution of the server-side prepared statement that enables this functionality, which the driver ignored (using the original metadata returned during `prepare()`), causing corrupt reading of data due to type mismatch when the actual rows were returned. (Bug #26173)
- Whitespace surrounding storage/size specifiers in stored procedure parameters declaration causes `NumberFormatException` to be thrown when calling stored procedure on JDK-1.5 or newer, as the Number classes in JDK-1.5+ are whitespace intolerant. (Bug #25624)
- `Connection.getTransactionIsolation()` uses "`SHOW VARIABLES LIKE`" which is very inefficient on MySQL-5.0+ servers. (Bug #27655)
- `ResultSet.get*()` with a column index < 1 returns misleading error message. (Bug #27317)
- Fixed issue where calling `getGeneratedKeys()` on a prepared statement after calling `execute()` didn't always return the generated keys (`executeUpdate()` worked fine however). (Bug #27655)
- `BIT(> 1)` is returned as `java.lang.String` from `ResultSet.getObject()` rather than `byte[]`. (Bug #25328)
- `PreparedStatement` is not closed in `BlobFromLocator.getBytes()`. (Bug #26592)
- Fast date/time parsing doesn't take into account `00:00:00` as a legal value. (Bug #26789)
- Client options not sent correctly when using SSL, leading to stored procedures not being able to return results. Thanks to Don Cohen for the bug report, testcase and patch. (Bug #25545)
- More useful error messages are generated when the driver thinks a result set is not updatable. (Thanks to Ashley Martens for the patch). (Bug #28085)
- `CALL /* ... */ some_proc()` doesn't work. As a side effect of this fix, you can now use `/* */` and `#` comments when preparing statements using client-side prepared statement emulation.

  If the comments happen to contain parameter markers (`?`), they will be treated as belonging to the comment (that is, not recognized) rather than being a parameter of the statement.

  Note

  The statement when sent to the server will contain the comments as-is, they're not stripped during the process of preparing the `PreparedStatement` or `CallableStatement`.

  (Bug #27400)

- Comments in DDL of stored procedures/functions confuse procedure parser, and thus metadata about them can not be created, leading to inability to retrieve said metadata, or execute procedures that have certain comments in them. (Bug #26959)
- Using `ResultSet.get*()` with a column index less than 1 returns a misleading error message. (Bug #27317)
- `CallableStatements` with `OUT/INOUT` parameters that are "binary" (`BLOB`, `BIT`, `(VAR)BINARY`, `JAVA_OBJECT`) have extra 7 bytes. (Bug #25715)
- `Statement.setMaxRows()` is not effective on result sets materialized from cursors. (Bug #25517)

Changes in MySQL Connector/J 5.0.5 (2007-03-02)

Functionality Added or Changed

- We've added a new configuration option `treatUtilDateAsTimestamp`, which is `false` by default, as (1) We already had specific behavior to treat java.util.Date as a java.sql.Timestamp because it is useful to many folks, and (2) that behavior will very likely be required for drivers JDBC-post-4.0.
- Added configuration property `localSocketAddress`, which is the host name or IP address given to explicitly configure the interface that the driver will bind the client side of the TCP/IP connection to when connecting.
- Fixed logging of XA commands sent to server, it is now configurable using `logXaCommands` property (defaults to `false`).
- Usage Advisor now detects empty results sets and does not report on columns not referenced in those empty sets.
- Improved speed of `datetime` parsing for ResultSets that come from plain or nonserver-side prepared statements. You can enable old implementation with `useFastDateParsing=false` as a configuration parameter.
- **Important change:** Due to a number of issues with the use of server-side prepared statements, Connector/J 5.0.5 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

  To enable server-side prepared statements, add the following configuration property to your connector string:

  ```
  useServerPrepStmts=true
  ```

  The default value of this property is `false` (that is, Connector/J does not use server-side prepared statements).
- The `rewriteBatchedStatements` feature can now be used with server-side prepared statements.
- Usage Advisor will now issue warnings for result sets with large numbers of rows. You can configure the trigger value by using the `resultSetSizeThreshold` parameter, which has a default value of 100.

Bugs Fixed

- When using a server-side prepared statement the driver would send timestamps to the server using nanoseconds instead of milliseconds. (Bug #21438)
- Connection property `socketFactory` wasn't exposed using correctly named mutator/accessor, causing data source implementations that use JavaBean naming conventions to set properties to fail to set the property (and in the case of SJAS, fail silently when trying to set this parameter). (Bug #26326)

- `ParameterMetaData` throws `NullPointerException` when prepared SQL has a syntax error. Added `generateSimpleParameterMetadata` configuration property, which when set to `true` will generate metadata reflecting `VARCHAR` for every parameter (the default is `false`, which will cause an exception to be thrown if no parameter metadata for the statement is actually available). (Bug #21267)
- Connector/J now returns a better error message when server doesn't return enough information to determine stored procedure/function parameter types. (Bug #24065)
- When using the `rewriteBatchedStatements` connection option with `PreparedState.executeBatch()` an internal memory leak would occur. (Bug #25073)
- `EscapeProcessor` gets confused by multiple backslashes. We now push the responsibility of syntax errors back on to the server for most escape sequences. (Bug #25399)
- Specifying `US-ASCII` as the character set in a connection to a MySQL 4.1 or newer server does not map correctly. (Bug #24840)
- `DatabaseMetaData.getSchemas()` doesn't return a `TABLE_CATALOG` column. (Bug #23303)
- `INOUT` parameters in `CallableStatements` get doubly escaped. (Bug #25379)
- Client-side prepared statement parser gets confused by in-line comments `/*...*/` and therefore cannot rewrite batch statements or reliably detect the type of statements when they are used. (Bug #25025)
- Results sets from `UPDATE` statements that are part of multi-statement queries would cause an `SQLException` error, "Result is from UPDATE". (Bug #25009)
- When using server-side prepared statements and timestamp columns, value would be incorrectly populated (with nanoseconds, not microseconds). (Bug #21438)
- Some exceptions thrown out of `StandardSocketFactory` were needlessly wrapped, obscuring their true cause, especially when using socket timeouts. (Bug #21480)
- `StringUtils.indexOfIgnoreCaseRespectQuotes()` isn't case-insensitive on the first character of the target. This bug also affected `rewriteBatchedStatements` functionality when prepared statements did not use uppercase for the `VALUES` clause. (Bug #25047)
- Using `DatabaseMetaData.getSQLKeywords()` does not return a all of the of the reserved keywords for the current MySQL version. Current implementation returns the list of reserved words for MySQL 5.1, and does not distinguish between versions. (Bug #24794)
- A query execution which timed out did not always throw a `MySQLTimeoutException`. (Bug #25836)
- A connection error would occur when connecting to a MySQL server with certain character sets. Some collations/character sets reported as "unknown" (specifically `cias` variants of existing character sets), and inability to override the detected server character set. (Bug #23645)
- Using `setFetchSize()` breaks prepared `SHOW` and other commands. (Bug #24360)
- Fixed issue where field-level for metadata from `DatabaseMetaData` when using `INFORMATION_SCHEMA` didn't have references to current connections, sometimes leading to Null Pointer Exceptions (NPEs) when introspecting them using `ResultSetMetaData`. (Bug #25073)
- Using `DATETIME` columns would result in time shifts when `useServerPrepStmts` was true. This occurred due to different behavior when using client-side compared to server-side prepared statements and the `useJDBCCompliantTimezoneShift` option. This is now fixed if moving from server-side prepared statements to client-side prepared statements by setting `useSSPSCompatibleTimezoneShift` to `true`, as the driver can't tell if this is a new deployment that never used server-side prepared statements, or if it is an existing deployment that is switching to client-side prepared statements from server-side prepared statements. (Bug #24344)

- When using a JDBC connection URL that is malformed, the `NonRegisteringDriver.getPropertyInfo` method will throw a Null Pointer Exception (NPE). (Bug #22628)
- Storing a `java.util.Date` object in a `BLOB` column would not be serialized correctly during `setObject`. (Bug #25787)
- Inconsistency between `getSchemas` and `INFORMATION_SCHEMA`. (Bug #23304)
- Calendars and timezones are now lazily instantiated when required. (Bug #24351)
- Timer instance used for `Statement.setQueryTimeout()` created per-connection, rather than per-VM, causing memory leak. (Bug #25514)
- Calling `Statement.cancel()` could result in a Null Pointer Exception (NPE). (Bug #24721)
- Fixed an issue where `XADataSources` couldn't be bound into JNDI, as the `DataSourceFactory` didn't know how to create instances of them.

Other Changes

- When using cached metadata, skip field-level metadata packets coming from the server, rather than reading them and discarding them without creating `com.mysql.jdbc.Field` instances.
- Use a `java.util.TreeMap` to map column names to ordinal indexes for `ResultSet.findColumn()` instead of a HashMap. This enables us to have case-insensitive lookups (required by the JDBC specification) without resorting to the many transient object instances needed to support this requirement with a normal `HashMap` with either case-adjusted keys, or case-insensitive keys. (In the worst case scenario for lookups of a 1000 column result set, TreeMaps are about half as fast wall-clock time as a HashMap, however in normal applications their use gives many orders of magnitude reduction in transient object instance creation which pays off later for CPU usage in garbage collection).
- Fixed cases where `ServerPreparedStatements` weren't using cached metadata when `cacheResultSetMetadata=true` was used.
- Take `localSocketAddress` property into account when creating instances of `CommunicationsException` when the underlying exception is a `java.net.BindException`, so that a friendlier error message is given with a little internal diagnostics.
- Fixed some Null Pointer Exceptions (NPEs) when cached metadata was used with `UpdatableResultSets`.
- When extracting foreign key information from `SHOW CREATE TABLE` in `DatabaseMetaData`, ignore exceptions relating to tables being missing (which could happen for cross-reference or imported-key requests, as the list of tables is generated first, then iterated).
- Reverted back to internal character conversion routines for single-byte character sets, as the ones internal to the JVM are using much more CPU time than our internal implementation.
- Changed cached result set metadata (when using `cacheResultSetMetadata=true`) to be cached per-connection rather than per-statement as previously implemented.
- Throw exceptions encountered during timeout to thread calling `Statement.execute*()`, rather than `RuntimeException`.
- Re-worked stored procedure parameter parser to be more robust. Driver no longer requires `BEGIN` in stored procedure definition, but does have requirement that if a stored function begins with a label directly after the "returns" clause, that the label is not a quoted identifier.
- Performance enhancement of initial character set configuration, driver will only send commands required to configure connection character set session variables if the current values on the server do not match what is required.

- Avoid static synchronized code in JVM class libraries for dealing with default timezones.

Changes in MySQL Connector/J 5.0.4 (2006-10-20)

Bugs Fixed

- Driver issues truncation on write exception when it shouldn't (due to sending big decimal incorrectly to server with server-side prepared statement). (Bug #22290)
- Newlines causing whitespace to span confuse procedure parser when getting parameter metadata for stored procedures. (Bug #22024)
- Driver was using milliseconds for Statement.setQueryTimeout() when specification says argument is to be in seconds. (Bug #22359)
- Added new _ci collations to CharsetMapping - utf8_unicode_ci not working. (Bug #22456)
- Workaround for server crash when calling stored procedures using a server-side prepared statement (driver now detects prepare(stored procedure) and substitutes client-side prepared statement). (Bug #22297)
- When using information_schema for metadata, COLUMN_SIZE for getColumns() is not clamped to range of java.lang.Integer as is the case when not using information_schema, thus leading to a truncation exception that isn't present when not using information_schema. (Bug #21544)
- DBMD.getColumns() does not return expected COLUMN_SIZE for the SET type, now returns length of largest possible set disregarding whitespace or the "," delimiters to be consistent with the ODBC driver. (Bug #22613)
- Column names don't match metadata in cases where server doesn't return original column names (column functions) thus breaking compatibility with applications that expect 1-to-1 mappings between `findColumn()` and `rsmd.getColumnName()`, usually manifests itself as "Can't find column (")" exceptions. (Bug #21379)
- Driver now supports `{call sp}` (without "()" if procedure has no arguments).
- DatabaseMetaData correctly reports `true` for `supportsCatalog*()` methods.
- Fixed configuration property `jdbcCompliantTruncation` was not being used for reads of result set values.
- Driver now sends numeric 1 or 0 for client-prepared statement `setBoolean()` calls instead of '1' or '0'.

Changes in MySQL Connector/J 5.0.3 (2006-07-26, beta)

Functionality Added or Changed

- Added configuration option `noAccessToProcedureBodies` which will cause the driver to create basic parameter metadata for `CallableStatements` when the user does not have access to procedure bodies using `SHOW CREATE PROCEDURE` or selecting from `mysql.proc` instead of throwing an exception. The default value for this option is `false`

Bugs Fixed

- Fixed `Statement.cancel()` causes `NullPointerException` if underlying connection has been closed due to server failure. (Bug #20650)
- If the connection to the server has been closed due to a server failure, then the cleanup process will call `Statement.cancel()`, triggering a `NullPointerException`, even though there is no active connection. (Bug #20650)

Changes in MySQL Connector/J 5.0.2 (2006-07-11)

Bugs Fixed

- `MysqlXaConnection.recover(int flags)` now permits combinations of `XAResource.TMSTARTRSCAN` and `TMENDRSCAN`. To simulate the “scanning” nature of the interface, we return all prepared XIDs for `TMSTARTRSCAN`, and no new XIDs for calls with `TMNOFLAGS`, or `TMENDRSCAN` when not in combination with `TMSTARTRSCAN`. This change was made for API compliance, as well as integration with IBM WebSphere's transaction manager. (Bug #20242)
- Fixed `MysqlValidConnectionChecker` for JBoss doesn't work with `MySQLXADataSources`. (Bug #20242)
- Added connection/datasource property `pinGlobalTxToPhysicalConnection` (defaults to `false`). When set to `true`, when using `XAConnections`, the driver ensures that operations on a given XID are always routed to the same physical connection. This enables the `XAConnection` to support `XA START ... JOIN` after `XA END` has been called, and is also a workaround for transaction managers that don't maintain thread affinity for a global transaction (most either always maintain thread affinity, or have it as a configuration option). (Bug #20242)
- Fixed driver fails on non-ASCII platforms. The driver was assuming that the platform character set would be a superset of MySQL's `latin1` when doing the handshake for authentication, and when reading error messages. We now use Cp1252 for all strings sent to the server during the handshake phase, and a hard-coded mapping of the `language` [486] system variable to the character set that is used for error messages. (Bug #18086)
- Fixed can't use `XAConnection` for local transactions when no global transaction is in progress. (Bug #17401)
- Better caching of character set converters (per-connection) to remove a bottleneck for multi-byte character sets. (Bug #20242)
- Fixed `ConnectionProperties` (and thus some subclasses) are not serializable, even though some J2EE containers expect them to be. (Bug #19169)

Changes in MySQL Connector/J 5.0.1 (Not Released)

Not released due to a packaging error

Version 5.0.1 has no changelog entries.

Changes in MySQL Connector/J 5.0.0 (2005-12-22)

Bugs Fixed

- Added support for Connector/MXJ integration using url subprotocol `jdbc:mysql:mxj://...`. (Bug #14729)
- Idle timeouts cause `XAConnections` to whine about rolling themselves back. (Bug #14729)
- When fix for Bug #14562 was merged from 3.1.12, added functionality for `CallableStatement`'s parameter metadata to return correct information for `.getParameterClassName()`. (Bug #14729)
- Added service-provider entry to `META-INF/services/java.sql.Driver` for JDBC-4.0 support. (Bug #14729)
- Fuller synchronization of `Connection` to avoid deadlocks when using multithreaded frameworks that multithread a single connection (usually not recommended, but the JDBC spec permits it anyways), part of fix to Bug #14972). (Bug #14729)
- Moved all `SQLException` constructor usage to a factory in `SQLError` (ground-work for JDBC-4.0 `SQLState`-based exception classes). (Bug #14729)

- Removed Java5-specific calls to `BigDecimal` constructor (when result set value is `''`, `(int)0` was being used as an argument indirectly using method return value. This signature doesn't exist prior to Java5.) (Bug #14729)
- Implementation of `Statement.cancel()` and `Statement.setQueryTimeout()`. Both require MySQL-5.0.0 or newer server, require a separate connection to issue the `KILL QUERY` statement, and in the case of `setQueryTimeout()` creates an additional thread to handle the timeout functionality.

  Note: Failures to cancel the statement for `setQueryTimeout()` may manifest themselves as `RuntimeExceptions` rather than failing silently, as there is currently no way to unblock the thread that is executing the query being cancelled due to timeout expiration and have it throw the exception instead. (Bug #14729)
- Return "[VAR]BINARY" for `RSMD.getColumnTypeName()` when that is actually the type, and it can be distinguished (MySQL-4.1 and newer). (Bug #14729)
- Add one level of indirection of internal representation of `CallableStatement` parameter metadata to avoid class not found issues on JDK-1.3 for `ParameterMetadata` interface (which doesn't exist prior to JDBC-3.0).
- `PreparedStatement.setString()` didn't work correctly when `sql_mode` [526] on server contained `NO_BACKSLASH_ESCAPES` [573] and no characters that needed escaping were present in the string.
- Setting `useJDBCCompliantTimezoneShift=true` (it is not the default) causes the driver to use GMT for *all* `TIMESTAMP`/`DATETIME` time zones, and the current VM time zone for any other type that refers to time zones. This feature can not be used when `useTimezone=true` to convert between server and client time zones.
- Return original column name for `RSMD.getColumnName()` if the column was aliased, alias name for `.getColumnLabel()` (if aliased), and original table name for `.getTableName()`. Note this only works for MySQL-4.1 and newer, as older servers don't make this information available to clients.
- Moved `-bin-g.jar` file into separate `debug` subdirectory to avoid confusion.
- `XADataSource` implemented (ported from 3.2 branch which won't be released as a product). Use `com.mysql.jdbc.jdbc2.optional.MysqlXADataSource` as your datasource class name in your application server to utilize XA transactions in MySQL-5.0.10 and newer.
- Do not permit `.setAutoCommit(true)`, or `.commit()` or `.rollback()` on an XA-managed connection as per the JDBC specification.
- If the connection `useTimezone` is set to `true`, then also respect time zone conversions in escape-processed string literals (for example, `"{ts ...}"` and `"{t ...}"`).
- Added unit tests for `XADatasource`, as well as friendlier exceptions for XA failures compared to the "stock" `XAException` (which has no messages).
- Attempt detection of the MySQL type `BINARY` (it is an alias, so this isn't always reliable), and use the `java.sql.Types.BINARY` type mapping for it.

Changes in MySQL Connector/J 3.1.x

Changes in MySQL Connector/J 3.1.15 (Not yet released)

Important change: Due to a number of issues with the use of server-side prepared statements, Connector/J 5.0.5 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

To enable server-side prepared statements you must add the following configuration property to your connector string:

```
useServerPrepStmts=true
```

The default value of this property is `false` (that is, Connector/J does not use server-side prepared statements).

Version 3.1.15 has no changelog entries.

Changes in MySQL Connector/J 3.1.14 (2006-10-19)

Bugs Fixed

- Check and store value for continueBatchOnError property in constructor of Statements, rather than when executing batches, so that Connections closed out from underneath statements don't cause NullPointerExceptions when it is required to check this property. (Bug #22290)
- Fixed Updatable result set that contains a BIT column fails when server-side prepared statements are used. (Bug #20485)
- Escape of quotation marks in client-side prepared statements parsing not respected. Patch covers more than bug report, including NO_BACKSLASH_ESCAPES being set, and stacked quote characters forms of escaping (that is, '' or ""). (Bug #20888)
- Driver now sends numeric 1 or 0 for client-prepared statement setBoolean() calls instead of '1' or '0'. (Bug #22290)
- Fixed bug where driver would not advance to next host if roundRobinLoadBalance=true and the last host in the list is down. (Bug #22290)
- Driver issues truncation on write exception when it shouldn't (due to sending big decimal incorrectly to server with server-side prepared statement). (Bug #22290)
- ResultSet.getSomeInteger() doesn't work for BIT(>1). (Bug #21062)
- Fixed bug when calling stored functions, where parameters weren't numbered correctly (first parameter is now the return value, subsequent parameters if specified start at index "2"). (Bug #22290)
- Removed logger autodetection altogether, must now specify logger explicitly if you want to use a logger other than one that logs to STDERR. (Bug #21207)
- Fixed can't pool server-side prepared statements, exception raised when re-using them. (Bug #20687)
- DDriver throws NPE when tracing prepared statements that have been closed (in asSQL()). (Bug #21207)
- Fixed ResultSet.getShort() for UNSIGNED TINYINT returns incorrect values when using server-side prepared statements. (Bug #20306)
- ReplicationDriver does not always round-robin load balance depending on URL used for slaves list. (Bug #19993)
- `DatabaseMetaData.getTables()` or `getColumns()` with a bad catalog parameter threw an exception rather than return an empty result set (as required by the specification). (Bug #18258)
- Fixed memory leak with profileSQL=true. (Bug #16987)
- Connection fails to localhost when using timeout and IPv6 is configured. (Bug #19726)
- Fixed updatable result set throws ClassCastException when there is row data and moveToInsertRow() is called. (Bug #20479)

- Fixed calling toString() on ResultSetMetaData for driver-generated (that is, from DatabaseMetaData method calls, or from getGeneratedKeys()) result sets would raise a NullPointerException. (Bug #19993)
- Fixed NullPointerException in MysqlDataSourceFactory due to Reference containing RefAddrs with null content. (Bug #16791)
- ResultSet.getFloatFromString() can't retrieve values near Float.MIN/MAX_VALUE. (Bug #18880)

Changes in MySQL Connector/J 3.1.13 (2006-05-26)

Bugs Fixed

- Added performance feature, re-writing of batched executes for `Statement.executeBatch()` (for all DML statements) and `PreparedStatement.executeBatch()` (for INSERTs with VALUE clauses only). Enable by using "rewriteBatchedStatements=true" in your JDBC URL. (Bug #18041)
- `DBMD.getColumns()` returns wrong type for `BIT`. (Bug #15854)
- `PreparedStatement.setObject()` serializes `BigInteger` as object, rather than sending as numeric value (and is thus not complementary to `.getObject()` on an `UNSIGNED LONG` type). (Bug #15383)
- Fixed aliased column names where length of name > 251 are corrupted. (Bug #18554)
- Exception thrown for new decimal type when using updatable result sets. (Bug #14609)
- Improved performance of retrieving `BigDecimal`, `Time`, `Timestamp` and `Date` values from server-side prepared statements by creating fewer short-lived instances of `Strings` when the native type is not an exact match for the requested type. (Bug #18496)
- Fixed calling `clearParameters()` on a closed prepared statement causes NPE. (Bug #17587)
- Driver now aware of fix for `BIT` type metadata that went into MySQL-5.0.21 for server not reporting length consistently . (Bug #13601)
- No "dos" character set in MySQL > 4.1.0. (Bug #15544)
- Map "latin1" on MySQL server to CP1252 for MySQL > 4.1.0. (Bug #17587)
- Fixed `CallableStatement.registerOutParameter()` not working when some parameters pre-populated. Still waiting for feedback from JDBC experts group to determine what correct parameter count from `getMetaData()` should be, however. (Bug #17898)
- Fixed `ResultSet.wasNull()` not always reset correctly for booleans when done using conversion for server-side prepared statements. (Bug #17450)
- Added support for Apache Commons logging, use "com.mysql.jdbc.log.CommonsLogger" as the value for the "logger" configuration property. (Bug #13469)
- Fixed `ResultSet.wasNull()` returns incorrect value when extracting native string from server-side prepared statement generated result set. (Bug #19282)
- Fixed updatable result set doesn't return `AUTO_INCREMENT` values for `insertRow()` when multiple column primary keys are used. (the driver was checking for the existence of single-column primary keys and an autoincrement value > 0 instead of a straightforward `isAutoIncrement()` check). (Bug #16841)
- Fixed invalid classname returned for `ResultSetMetaData.getColumnClassName()` for `BIGINT type`. (Bug #19282)
- `INOUT` parameter does not store `IN` value. (Bug #15464)

- Fixed issue with `ReplicationConnection` incorrectly copying state, doesn't transfer connection context correctly when transitioning between the same read-only states. (Bug #15570)
- Fixed case where driver wasn't reading server status correctly when fetching server-side prepared statement rows, which in some cases could cause warning counts to be off, or multiple result sets to not be read off the wire. (Bug #19282)
- `Fixed PreparedStatement.setObject(int, Object, int)` doesn't respect scale of BigDecimals. (Bug #19615)
- Fixed driver trying to call methods that don't exist on older and newer versions of Log4j. The fix is not trying to auto-detect presence of log4j, too many different incompatible versions out there in the wild to do this reliably.

  If you relied on autodetection before, you will need to add "logger=com.mysql.jdbc.log.Log4JLogger" to your JDBC URL to enable Log4J usage, or alternatively use the new "CommonsLogger" class to take care of this. (Bug #13469)
- Fixed `Statement.getGeneratedKeys()` throws `NullPointerException` when no query has been processed. (Bug #17099)
- `lib-nodist` directory missing from package breaks out-of-box build. (Bug #15676)
- Added additional accessor and mutator methods on ConnectionProperties so that DataSource users can use same naming as regular URL properties. (Bug #17587)
- LogFactory now prepends `com.mysql.jdbc.log` to the log class name if it cannot be found as specified. This enables you to use “short names” for the built-in log factories, for example, `logger=CommonsLogger` instead of `logger=com.mysql.jdbc.log.CommonsLogger`. (Bug #13469)
- Fixed data truncation and `getWarnings()` only returns last warning in set. (Bug #18740)
- Fixed issue where server-side prepared statements don't cause truncation exceptions to be thrown when truncation happens. (Bug #18041)
- Fixed issue where driver was unable to initialize character set mapping tables. Removed reliance on `.properties` files to hold this information, as it turns out to be too problematic to code around class loader hierarchies that change depending on how an application is deployed. Moved information back into the `CharsetMapping` class. (Bug #14938)
- `ResultSet.getShort()` for `UNSIGNED TINYINT` returned wrong values. (Bug #11874)

Changes in MySQL Connector/J 3.1.12 (2005-11-30)

Bugs Fixed

- Driver incorrectly closes streams passed as arguments to `PreparedStatements`. Reverts to legacy behavior by setting the JDBC configuration property `autoClosePStmtStreams` to `true` (also included in the 3-0-Compat configuration “bundle”). (Bug #15024)
- `storesMixedCaseIdentifiers()` returns `false` (Bug #14562)
- `storesLowerCaseIdentifiers()` returns `true` (Bug #14562)
- Deadlock while closing server-side prepared statements from multiple threads sharing one connection. (Bug #14972)
- OpenOffice expects `DBMD.supportsIntegrityEnhancementFacility()` to return `true` if foreign keys are supported by the datasource, even though this method also covers support for check constraints, which MySQL *doesn't* have. Setting the configuration property `overrideSupportsIntegrityEnhancementFacility` to `true` causes the driver to return `true` for this method. (Bug #12975)

- `storesMixedCaseQuotedIdentifiers()` returns `false` (Bug #14562)
- `storesMixedCaseQuotedIdentifiers()` returns `true` (Bug #14562)
- `maxQuerySizeToLog` is not respected. Added logging of bound values for `execute()` phase of server-side prepared statements when `profileSQL=true` as well. (Bug #13048)
- Process escape tokens in `Connection.prepareStatement(...)`. You can disable this behavior by setting the JDBC URL configuration property `processEscapeCodesForPrepStmts` to `false`. (Bug #15141)
- `DatabaseMetaData.getColumns()` doesn't return `TABLE_NAME` correctly. (Bug #14815)
- If `lower_case_table_names=0` (on server):
  - `storesLowerCaseIdentifiers()` returns `false`
  - `storesLowerCaseQuotedIdentifiers()` returns `false`
  - `storesMixedCaseIdentifiers()` returns `true`
  - `storesMixedCaseQuotedIdentifiers()` returns `true`
  - `storesUpperCaseIdentifiers()` returns `false`
  - `storesUpperCaseQuotedIdentifiers()` returns `true`

  (Bug #14562)
- `storesUpperCaseIdentifiers()` returns `false` (Bug #14562)
- `storesUpperCaseQuotedIdentifiers()` returns `true` (Bug #14562)
- If `lower_case_table_names=1` (on server):
  - `storesLowerCaseIdentifiers()` returns `true`
  - `storesLowerCaseQuotedIdentifiers()` returns `true`
  - `storesMixedCaseIdentifiers()` returns `false`
  - `storesMixedCaseQuotedIdentifiers()` returns `false`
  - `storesUpperCaseIdentifiers()` returns `false`
  - `storesUpperCaseQuotedIdentifiers()` returns `true`

  (Bug #14562)
- Extraneous sleep on `autoReconnect`. (Bug #13775)
- `storesLowerCaseQuotedIdentifiers()` returns `true` (Bug #14562)
- Fixed `DatabaseMetaData.stores*Identifiers()`:
  - If `lower_case_table_names=0` (on server):
    - `storesLowerCaseIdentifiers()` returns `false`
    - `storesLowerCaseQuotedIdentifiers()` returns `false`
    - `storesMixedCaseIdentifiers()` returns `true`
    - `storesMixedCaseQuotedIdentifiers()` returns `true`

    - `storesUpperCaseIdentifiers()` returns `false`
    - `storesUpperCaseQuotedIdentifiers()` returns `true`
  - If `lower_case_table_names=1` (on server):
    - `storesLowerCaseIdentifiers()` returns `true`
    - `storesLowerCaseQuotedIdentifiers()` returns `true`
    - `storesMixedCaseIdentifiers()` returns `false`
    - `storesMixedCaseQuotedIdentifiers()` returns `false`
    - `storesUpperCaseIdentifiers()` returns `false`
    - `storesUpperCaseQuotedIdentifiers()` returns `true`

  (Bug #14562)
- Reconnect during middle of `executeBatch()` should not occur if `autoReconnect` is enabled. (Bug #13255)
- `storesMixedCaseIdentifiers()` returns `true` (Bug #14562)
- Usage advisor complains about unreferenced columns, even though they've been referenced. (Bug #15065)
- `storesLowerCaseQuotedIdentifiers()` returns `false` (Bug #14562)
- Java type conversion may be incorrect for `MEDIUMINT`. (Bug #14562)
- Added `com.mysql.jdbc.testsuite.url.default` system property to set default JDBC url for testsuite (to speed up bug resolution when I'm working in Eclipse). (Bug #12975)
- Unable to initialize character set mapping tables (due to J2EE classloader differences). (Bug #14938)
- `storesLowerCaseIdentifiers()` returns `false` (Bug #14562)
- Escape processor replaces quote character in quoted string with string delimiter. (Bug #14909)
- Added configuration property `useGmtMillisForDatetimes` which when set to `true` causes `ResultSet.getDate()`, `.getTimestamp()` to return correct millis-since GMT when `.getTime()` is called on the return value (currently default is `false` for legacy behavior). (Bug #14562)
- `logSlowQueries` should give better info. (Bug #12230)
- Don't increase timeout for failover/reconnect. (Bug #6577)
- Fall back to platform-encoding for `URLDecoder.decode()` when parsing driver URL properties if the platform doesn't have a two-argument version of this method.
- Do not permit `executeBatch()` for `CallableStatements` with registered `OUT`/`INOUT` parameters (JDBC compliance).
- Fixed client-side prepared statement bug with embedded `?` characters inside quoted identifiers (it was recognized as a placeholder, when it was not).

Changes in MySQL Connector/J 3.1.11 (2005-10-07)

Bugs Fixed

- `getExportedKeys()` (Bug #12541)
- Specifying a catalog works as stated in the API docs. (Bug #12541)
- Specifying `NULL` means that catalog will not be used to filter the results (thus all databases will be searched), unless you've set `nullCatalogMeansCurrent=true` in your JDBC URL properties. (Bug #12541)
- Tokenizer for `=` in URL properties was causing `sessionVariables=...` to be parameterized incorrectly. (Bug #12753)
- `getIndexInfo()` (Bug #12541)
- `getProcedures()` (and thus indirectly `getProcedureColumns()`) (Bug #12541)
- `getImportedKeys()` (Bug #12541)
- Specifying `""` means “current” catalog, even though this isn't quite JDBC spec compliant, it is there for legacy users. (Bug #12541)
- `getCrossReference()` (Bug #12541)
- The configuration property `sessionVariables` now permits you to specify variables that start with the “`@`” sign. (Bug #13453)
- Added `Connection.isMasterConnection()` for clients to be able to determine if a multi-host master/slave connection is connected to the first host in the list. (Bug #12541)
- Workaround for Bug #13374: `ResultSet.getStatement()` on closed result set returns `NULL` (as per JDBC 4.0 spec, but not backward-compatible). Set the connection property `retainStatementAfterResultSetClose` to `true` to be able to retrieve a `ResultSet`'s statement after the `ResultSet` has been closed using `.getStatement()` (the default is `false`, to be JDBC-compliant and to reduce the chance that code using JDBC leaks `Statement` instances). (Bug #13277)
- `java.sql.Types.OTHER` returned for `BINARY` and `VARBINARY` columns when using `DatabaseMetaData.getColumns()`. (Bug #12970)
- URL configuration parameters do not permit “`&`” or “`=`” in their values. The JDBC driver now parses configuration parameters as if they are encoded using the application/x-www-form-urlencoded format as specified by `java.net.URLDecoder` (http://java.sun.com/j2se/1.5.0/docs/api/java/net/URLDecoder.html).

  If the “`%`” character is present in a configuration property, it must now be represented as `%25`, which is the encoded form of “`%`” when using application/x-www-form-urlencoded encoding. (Bug #13453)
- `getColumns()` (Bug #12541)
- Handling of catalog argument in `DatabaseMetaData.getIndexInfo()`, which also means changes to the following methods in `DatabaseMetaData`:
  - `getBestRowIdentifier()`
  - `getColumns()`
  - `getCrossReference()`
  - `getExportedKeys()`
  - `getImportedKeys()`
  - `getIndexInfo()`
  - `getPrimaryKeys()`

  - `getProcedures()` (and thus indirectly `getProcedureColumns()`)
  - `getTables()`

  The `catalog` argument in all of these methods now behaves in the following way:

  - Specifying `NULL` means that catalog will not be used to filter the results (thus all databases will be searched), unless you've set `nullCatalogMeansCurrent=true` in your JDBC URL properties.
  - Specifying `""` means “current” catalog, even though this isn't quite JDBC spec compliant, it is there for legacy users.
  - Specifying a catalog works as stated in the API docs.
  - Made `Connection.clientPrepare()` available from “wrapped” connections in the `jdbc2.optional` package (connections built by `ConnectionPoolDataSource` instances).

  (Bug #12541)

- `getBestRowIdentifier()` (Bug #12541)
- Made `Connection.clientPrepare()` available from “wrapped” connections in the `jdbc2.optional` package (connections built by `ConnectionPoolDataSource` instances). (Bug #12541)
- `ServerPreparedStatement.getBinding()` now checks if the statement is closed before attempting to reference the list of parameter bindings, to avoid throwing a `NullPointerException`. (Bug #12970)
- `ResultSetMetaData` from `Statement.getGeneratedKeys()` caused a `NullPointerException` to be thrown whenever a method that required a connection reference was called. (Bug #13277)
- `cp1251` incorrectly mapped to `win1251` for servers newer than 4.0.x. (Bug #12752)
- When `gatherPerfMetrics` is enabled for servers older than 4.1.0, a `NullPointerException` is thrown from the constructor of `ResultSet` if the query doesn't use any tables. (Bug #13043)
- Backport of `VAR[BINARY|CHAR] [BINARY]` types detection from 5.0 branch. (Bug #13277)
- `getTables()` (Bug #12541)
- Fixed `NullPointerException` when converting `catalog` parameter in many `DatabaseMetaDataMethods` to `byte[]`s (for the result set) when the parameter is `null`. (`null` is not technically permitted by the JDBC specification, but we have historically permitted it). (Bug #13277)
- Backport of `Field` class, `ResultSetMetaData.getColumnClassName()`, and `ResultSet.getObject(int)` changes from 5.0 branch to fix behavior surrounding `VARCHAR BINARY`/`VARBINARY` and related types. (Bug #13277)
- Read response in `MysqlIO.sendFileToServer()`, even if the local file can't be opened, otherwise next query issued will fail, because it is reading the response to the empty `LOAD DATA INFILE` packet sent to the server. (Bug #13277)
- `Connection.prepareCall()` is database name case-sensitive (on Windows systems). (Bug #12417)
- `getPrimaryKeys()` (Bug #12541)
- Geometry types not handled with server-side prepared statements. (Bug #12104)
- `explainSlowQueries` hangs with server-side prepared statements. (Bug #12229)

- `Pstmt.setObject(..., Types.BOOLEAN)` throws exception. (Bug #11798)
- Reworked `Field` class, `*Buffer`, and `MysqlIO` to be aware of field lengths > `Integer.MAX_VALUE`. (Bug #11498)
- Foreign key information that is quoted is parsed incorrectly when `DatabaseMetaData` methods use that information. (Bug #11781)
- Fixed regression caused by fix for Bug #11552 that caused driver to return incorrect values for unsigned integers when those integers where within the range of the positive signed type. (Bug #11663)
- Escape tokenizer doesn't respect stacked single quotation marks for escapes. (Bug #11797)
- Escape processor didn't honor strings demarcated with double quotation marks. (Bug #11498)
- `maxPerformance.properties` mis-spells “elideSetAutoCommits”. (Bug #11976)
- Moved source code to Subversion repository. (Bug #11663)
- The `sendBlobChunkSize` property is now clamped to `max_allowed_packet` [493] with consideration of stream buffer size and packet headers to avoid `PacketTooBigExceptions` when `max_allowed_packet` [493] is similar in size to the default `sendBlobChunkSize` which is 1M. (Bug #11781)
- `Statement.getWarnings()` fails with NPE if statement has been closed. (Bug #10630)
- `DBMD.storesLower/Mixed/UpperIdentifiers()` reports incorrect values for servers deployed on Windows. (Bug #11575)
- `ResultSet.moveToCurrentRow()` fails to work when preceded by a call to `ResultSet.moveToInsertRow()`. (Bug #11190)
- `VARBINARY` data corrupted when using server-side prepared statements and `.setBytes()`. (Bug #11115)
- Only get `char[]` from SQL in `PreparedStatement.ParseInfo()` when needed. (Bug #10630)
- Incorrect generation of testcase scripts for server-side prepared statements. (Bug #11663)
- `GEOMETRY` type not recognized when using server-side prepared statements. (Bug #11797)
- `CallableStatement.clearParameters()` now clears resources associated with `INOUT`/`OUTPUT` parameters as well as `INPUT` parameters. (Bug #11781)
- `StringUtils.getBytes()` doesn't work when using multi-byte character encodings and a length in *characters* is specified. (Bug #11614)
- Fixed statements generated for testcases missing `;` for “plain” statements. (Bug #11629)
- `ReplicationConnection` won't switch to slave, throws “Catalog can't be null” exception. (Bug #11879)
- Spurious `!` on console when character encoding is `utf8`. (Bug #11629)
- Properties shared between master and slave with replication connection. (Bug #12218)
- Updated `DBMD.supportsCorrelatedQueries()` to return `true` for versions > 4.1, `supportsGroupByUnrelated()` to return `true` and `getResultSetHoldability()` to return `HOLD_CURSORS_OVER_COMMIT`. (Bug #11498)
- Lifted restriction of changing streaming parameters with server-side prepared statements. As long as `all` streaming parameters were set before execution, `.clearParameters()` does not have to be called. (due to limitation of client/server protocol, prepared statements can not reset *individual* stream data on the server side). (Bug #11498)

Changes in MySQL Connector/J 3.1.10 (2005-06-23)

Bugs Fixed

- Fixed connecting without a database specified raised an exception in `MysqlIO.changeDatabaseTo()`.
- Initial implemention of `ParameterMetadata` for `PreparedStatement.getParameterMetadata()`. Only works fully for `CallableStatements`, as current server-side prepared statements return every parameter as a `VARCHAR` type.

Changes in MySQL Connector/J 3.1.9 (2005-06-22)

Bugs Fixed

- Fixed `PreparedStatement.setClob()` not accepting `null` as a parameter. (Bug #11360)
- Actually write manifest file to correct place so it ends up in the binary jar file. (Bug #10144)
- Try to handle `OutOfMemoryErrors` more gracefully. Although not much can be done, they will in most cases close the connection they happened on so that further operations don't run into a connection in some unknown state. When an OOM has happened, any further operations on the connection will fail with a “Connection closed” exception that will also list the OOM exception as the reason for the implicit connection close event. (Bug #10850)
- `autoReconnect` ping causes exception on connection startup. (Bug #11259)
- Reorganized directory layout. Sources now are in `src` folder. Don't pollute parent directory when building, now output goes to `./build`, distribution goes to `./dist`. (Bug #10496)
- `Connection.setCatalog()` is now aware of the `useLocalSessionState` configuration property, which when set to `true` will prevent the driver from sending `USE ...` to the server if the requested catalog is the same as the current catalog. (Bug #11115)
- Setting `cachePrepStmts=true` now causes the `Connection` to also cache the check the driver performs to determine if a prepared statement can be server-side or not, as well as caches server-side prepared statements for the lifetime of a connection. As before, the `prepStmtCacheSize` parameter controls the size of these caches. (Bug #10850)
- Don't send `COM_RESET_STMT` for each execution of a server-side prepared statement if it isn't required. (Bug #10850)
- `3-0-Compat`: Compatibility with Connector/J 3.0.x functionality (Bug #11115)
- Production package doesn't include JBoss integration classes. (Bug #11411)
- `maxPerformance`: Maximum performance without being reckless (Bug #11115)
- Unsigned `SMALLINT` treated as signed for `ResultSet.getInt()`, fixed all cases for `UNSIGNED` integer values and server-side prepared statements, as well as `ResultSet.getObject()` for `UNSIGNED TINYINT`. (Bug #10156)
- `solarisMaxPerformance`: Maximum performance for Solaris, avoids syscalls where it can (Bug #11115)
- Added `maintainTimeStats` configuration property (defaults to `true`), which tells the driver whether or not to keep track of the last query time and the last successful packet sent to the server's time. If set to `false`, removes two syscalls per query. (Bug #11115)
- 0-length streams not sent to server when using server-side prepared statements. (Bug #10850)
- The data type returned for `TINYINT(1)` columns when `tinyInt1isBit=true` (the default) can be switched between `Types.BOOLEAN` and `Types.BIT` using the new configuration

property `transformedBitIsBoolean`, which defaults to `false`. If set to `false` (the default), `DatabaseMetaData.getColumns()` and `ResultSetMetaData.getColumnType()` will return `Types.BOOLEAN` for `TINYINT(1)` columns. If `true`, `Types.BOOLEAN` will be returned instead. Regardless of this configuration property, if `tinyInt1isBit` is enabled, columns with the type `TINYINT(1)` will be returned as `java.lang.Boolean` instances from `ResultSet.getObject(...)`, and `ResultSetMetaData.getColumnClassName()` will return `java.lang.Boolean`. (Bug #10485)

- `VARBINARY` data corrupted when using server-side prepared statements and `ResultSet.getBytes()`. (Bug #11115)
- Added `createDatabaseIfNotExist` property (default is `false`), which will cause the driver to ask the server to create the database specified in the URL if it doesn't exist. You must have the appropriate privileges for database creation for this to work. (Bug #10144)
- `SQLException` thrown when retrieving `YEAR(2)` with `ResultSet.getString()`. The driver will now always treat `YEAR` types as `java.sql.Dates` and return the correct values for `getString()`. Alternatively, the `yearIsDateType` connection property can be set to `false` and the values will be treated as `SHORT`s. (Bug #10485)
- Connector/J dumping query into `SQLException` twice. (Bug #11360)
- Made `ServerPreparedStatement.asSql()` work correctly so auto-explain functionality would work with server-side prepared statements. (Bug #10155)
- Double quotation marks not recognized when parsing client-side prepared statements. (Bug #10155)
- Removed nonsensical “costly type conversion” warnings when using usage advisor. (Bug #11411)
- `com.mysql.jdbc.PreparedStatement.ParseInfo` does unnecessary call to `toCharArray()`. (Bug #9064)
- Driver doesn't support `{?=CALL(...)}` for calling stored functions. This involved adding support for function retrieval to `DatabaseMetaData.getProcedures()` and `getProcedureColumns()` as well. (Bug #10310)
- Memory leak in `ServerPreparedStatement` if `serverPrepare()` fails. (Bug #10144)
- Added support/bug hunting feature that generates `.sql` test scripts to `STDERR` when `autoGenerateTestcaseScript` is set to `true`. (Bug #10496)
- Driver detects if you're running MySQL-5.0.7 or later, and does not scan for `LIMIT ?[,?]` in statements being prepared, as the server supports those types of queries now. (Bug #10850)
- `SQLException` is thrown when using property `characterSetResults` with `cp932` or `eucjpms`. (Bug #10496)
- Made JDBC2-compliant wrappers public to enable access to vendor extensions. (Bug #10155)
- Added the following configuration bundles, use one or many using the `useConfigs` configuration property:

  - `maxPerformance`: Maximum performance without being reckless
  - `solarisMaxPerformance`: Maximum performance for Solaris, avoids syscalls where it can
  - `3-0-Compat`: Compatibility with Connector/J 3.0.x functionality

  (Bug #11115)
- `DatabaseMetaData.supportsMultipleOpenResults()` now returns `true`. The driver has supported this for some time, DBMD just missed that fact. (Bug #10155)

- Cleaned up logging of profiler events, moved code to dump a profiler event as a string to `com.mysql.jdbc.log.LogUtils` so that third parties can use it. (Bug #10155)
- Made `enableStreamingResults()` visible on `com.mysql.jdbc.jdbc2.optional.StatementWrapper`. (Bug #10155)
- Overhaul of character set configuration, everything now lives in a properties file.
- Driver now correctly uses CP932 if available on the server for Windows-31J, CP932 and MS932 java encoding names, otherwise it resorts to SJIS, which is only a close approximation. Currently only MySQL-5.0.3 and newer (and MySQL-4.1.12 or .13, depending on when the character set gets backported) can reliably support any variant of CP932.

Changes in MySQL Connector/J 3.1.8 (2005-04-14)

Bugs Fixed

- Added finalizers to `ResultSet` and `Statement` implementations to be JDBC spec-compliant, which requires that if not explicitly closed, these resources should be closed upon garbage collection. (Bug #9319)
- Should accept `null` for name patterns in DBMD (meaning "`%`"), even though it isn't JDBC compliant, for legacy's sake. Disable by setting connection property `nullNamePatternMatchesAll` to `false` (which will be the default value in C/J 3.2.x). (Bug #9769)
- Check for empty strings (`''`) when converting `CHAR`/`VARCHAR` column data to numbers, throw exception if `emptyStringsConvertToZero` configuration property is set to `false` (for backward-compatibility with 3.0, it is now set to `true` by default, but will most likely default to `false` in 3.2). (Bug #8803)
- The performance metrics feature now gathers information about number of tables referenced in a SELECT. (Bug #9704)
- Fixed driver not returning `true` for `-1` when `ResultSet.getBoolean()` was called on result sets returned from server-side prepared statements. (Bug #9778)
- `ServerPreparedStatements` now correctly "stream" `BLOB`/`CLOB` data to the server. You can configure the threshold chunk size using the JDBC URL property `blobSendChunkSize` (the default is 1MB). (Bug #8868)
- The logging system is now automatically configured. If the value has been set by the user, using the URL property `logger` or the system property `com.mysql.jdbc.logger`, then use that, otherwise, autodetect it using the following steps:

  1. Log4j, if it is available,
  2. Then JDK1.4 logging,
  3. Then fallback to our `STDERR` logging.

  (Bug #9704)
- Added a `Manifest.MF` file with implementation information to the `.jar` file. (Bug #9778)
- Should accept `null` for catalog (meaning use current) in DBMD methods, even though it is not JDBC-compliant for legacy's sake. Disable by setting connection property `nullCatalogMeansCurrent` to `false` (which will be the default value in C/J 3.2.x). (Bug #9917)
- More tests in `Field.isOpaqueBinary()` to distinguish opaque binary (that is, fields with type `CHAR(n)` and `CHARACTER SET BINARY`) from output of various scalar and aggregate functions that return strings. (Bug #9778)

- `DBMD.getTables()` shouldn't return tables if views are asked for, even if the database version doesn't support views. (Bug #9778)
- Added support for the c3p0 connection pool's (http://c3p0.sf.net/) validation/connection checker interface which uses the lightweight `COM_PING` call to the server if available. To use it, configure your c3p0 connection pool's `connectionTesterClassName` property to use `com.mysql.jdbc.integration.c3p0.MysqlConnectionTester`. (Bug #9320)
- `DATA_TYPE` column from `DBMD.getBestRowIdentifier()` causes `ArrayIndexOutOfBoundsException` when accessed (and in fact, didn't return any value). (Bug #8803)
- `DATE_FORMAT()` [985] queries returned as `BLOB`s from `getObject()`. (Bug #8868)
- A continuation of Bug #8868, where functions used in queries that should return nonstring types when resolved by temporary tables suddenly become opaque binary strings (work-around for server limitation). Also fixed fields with type of `CHAR(n) CHARACTER SET BINARY` to return correct/matching classes for `RSMD.getColumnClassName()` and `ResultSet.getObject()`. (Bug #9236)
- `PreparedStatement.getMetaData()` inserts blank row in database under certain conditions when not using server-side prepared statements. (Bug #9320)
- Better detection of `LIMIT` inside/outside of quoted strings so that the driver can more correctly determine whether a prepared statement can be prepared on the server or not. (Bug #9320)
- Stored procedures with `DECIMAL` parameters with storage specifications that contained "`,`" in them would fail. (Bug #9682)
- Server-side session variables can be preset at connection time by passing them as a comma-delimited list for the connection property `sessionVariables`. (Bug #8868)
- `Connection.canHandleAsPreparedStatement()` now makes "best effort" to distinguish `LIMIT` clauses with placeholders in them from ones without to have fewer false positives when generating work-arounds for statements the server cannot currently handle as server-side prepared statements. (Bug #9320)
- `BlobFromLocator` now uses correct identifier quoting when generating prepared statements. (Bug #8868)
- `Statement.getMoreResults()` could throw NPE when existing result set was `.close()`d. (Bug #9704)
- `PreparedStatement.addBatch()` doesn't work with server-side prepared statements and streaming `BINARY` data. (Bug #9040)
- Fixed `build.xml` to not compile `log4j` logging if `log4j` not available. (Bug #9320)
- Cannot use `UTF-8` for characterSetResults configuration property. (Bug #9206)
- `PreparedStatement.setObject(int, Object, int type, int scale)` now uses scale value for `BigDecimal` instances. (Bug #9682)
- `DBMD.supportsResultSetConcurrency()` not returning `true` for forward-only/read-only result sets (we obviously support this). (Bug #8792)
- Fixed regression in `ping()` for users using `autoReconnect=true`. (Bug #8868)
- Stored procedures with same name in different databases confuse the driver when it tries to determine parameter counts/types. (Bug #9319)
- `DBMD.supportsMixedCase*Identifiers()` returns wrong value on servers running on case-sensitive file systems. (Bug #8800)

- Fixed `DatabaseMetaData.getTables()` returning views when they were not asked for as one of the requested table types.
- Added support for new precision-math `DECIMAL` type in MySQL 5.0.3 and up.
- Made `Connection.ping()` a public method.
- Fixed `ResultSet.getTime()` on a `NULL` value for server-side prepared statements throws NPE.

Changes in MySQL Connector/J 3.1.7 (2005-02-18)

Bugs Fixed

- Infinite recursion when “falling back” to master in failover configuration. (Bug #7952)
- Disable multi-statements (if enabled) for MySQL-4.1 versions prior to version 4.1.10 if the query cache is enabled, as the server returns wrong results in this configuration. (Bug #7952)
- Added support for `BIT` type in MySQL-5.0.3. The driver will treat `BIT(1-8)` as the JDBC standard `BIT` type (which maps to `java.lang.Boolean`), as the server does not currently send enough information to determine the size of a bitfield when < 9 bits are declared. `BIT(>9)` will be treated as `VARBINARY`, and will return `byte[]` when `getObject()` is called. (Bug #8424)
- Added `useLocalSessionState` configuration property, when set to `true` the JDBC driver trusts that the application is well-behaved and only sets autocommit and transaction isolation levels using the methods provided on `java.sql.Connection`, and therefore can manipulate these values in many cases without incurring round-trips to the database server. (Bug #8424)
- Fixed synchronization issue with `ServerPreparedStatement.serverPrepare()` that could cause deadlocks/crashes if connection was shared between threads. (Bug #8096)
- Added `holdResultsOpenOverStatementClose` property (default is `false`), that keeps result sets open over statement.close() or new execution on same statement (suggested by Kevin Burton). (Bug #7715)
- Removed `dontUnpackBinaryResults` functionality, the driver now always stores results from server-side prepared statements as is from the server and unpacks them on demand. (Bug #7952)
- Detect new `sql_mode` [526] variable in string form (it used to be integer) and adjust quoting method for strings appropriately. (Bug #7715)
- Choose correct “direction” to apply time adjustments when both client and server are in GMT time zone when using `ResultSet.get(..., cal)` and `PreparedStatement.set(...., cal)`. (Bug #4718)
- Fixed duplicated code in `configureClientCharset()` that prevented `useOldUTF8Behavior=true` from working properly. (Bug #7952)
- Remove `_binary` introducer from parameters used as in/out parameters in `CallableStatement`. (Bug #4718)
- Always return `byte[]`s for output parameters registered as `*BINARY`. (Bug #4718)
- Timestamps converted incorrectly to strings with server-side prepared statements and updatable result sets. (Bug #7715)
- By default, the driver now scans SQL you are preparing using all variants of `Connection.prepareStatement()` to determine if it is a supported type of statement to prepare on the server side, and if it is not supported by the server, it instead prepares it as a client-side emulated prepared statement. You can disable this by passing `emulateUnsupportedPstmts=false` in your JDBC URL. (Bug #4718)

- Emulated locators corrupt binary data when using server-side prepared statements. (Bug #8096)
- Added `enableStreamingResults()` to `Statement` for connection pool implementations that check `Statement.setFetchSize()` for specification-compliant values. Call `Statement.setFetchSize(>=0)` to disable the streaming results for that statement. (Bug #8424)
- Added `dontTrackOpenResources` option (default is `false`, to be JDBC compliant), which helps with memory use for nonwell-behaved apps (that is, applications that don't close `Statement` objects when they should). (Bug #4718)
- Fixed NPE in `ResultSet.realClose()` when using usage advisor and result set was already closed. (Bug #8428)
- `ResultSet.getBigDecimal()` throws exception when rounding would need to occur to set scale. The driver now chooses a rounding mode of “half up” if nonrounding `BigDecimal.setScale()` fails. (Bug #8424)
- Send correct value for “boolean” `true` to server for `PreparedStatement.setObject(n, "true", Types.BIT)`. (Bug #4718)
- Timestamp key column data needed `_binary` stripped for `UpdatableResultSet.refreshRow()`. (Bug #7686)
- `PreparedStatements` not creating streaming result sets. (Bug #8487)
- `ResultSet.getString()` doesn't maintain format stored on server, bug fix only enabled when `noDatetimeStringSync` property is set to `true` (the default is `false`). (Bug #8428)
- Fixed bug with Connection not caching statements from `prepareStatement()` when the statement wasn't a server-side prepared statement. (Bug #4718)
- Don't pass `NULL` to `String.valueOf()` in `ResultSet.getNativeConvertToString()`, as it stringifies it (that is, returns `null`), which is not correct for the method in question. (Bug #8487)

Changes in MySQL Connector/J 3.1.6 (2004-12-23)

Bugs Fixed

- `DBMD.getProcedures()` doesn't respect catalog parameter. (Bug #7026)
- Fixed hang on `SocketInputStream.read()` with `Statement.setMaxRows()` and multiple result sets when driver has to truncate result set directly, rather than tacking a `LIMIT n` on the end of it.

Changes in MySQL Connector/J 3.1.5 (2004-12-02)

Bugs Fixed

- Removed unwanted new `Throwable()` in `ResultSet` constructor due to bad merge (caused a new object instance that was never used for every result set created). Found while profiling for Bug #6359. (Bug #6225)
- Use 1MB packet for sending file for `LOAD DATA LOCAL INFILE` if that is < `max_allowed_packet` [493] on server. (Bug #6537)
- Use our own implementation of buffered input streams to get around blocking behavior of `java.io.BufferedInputStream`. Disable this with `useReadAheadInput=false`. (Bug #6399)
- Added experimental configuration property `dontUnpackBinaryResults`, which delays unpacking binary result set values until they're asked for, and only creates object instances for nonnumeric values (it is set to `false` by default). For some usecase/jvm combinations, this is friendlier on the garbage collector. (Bug #5706)

- Fixed batched updates with server prepared statements weren't looking if the types had changed for a given batched set of parameters compared to the previous set, causing the server to return the error “Wrong arguments to mysql_stmt_execute()”. (Bug #5235)
- Make auto-deserialization of `java.lang.Objects` stored in `BLOB` columns configurable using `autoDeserialize` property (defaults to `false`). (Bug #6399)
- Don't throw exceptions for `Connection.releaseSavepoint()`. (Bug #5706)
- `ServerSidePreparedStatement` allocating short-lived objects unnecessarily. (Bug #6225)
- Inefficient detection of pre-existing string instances in `ResultSet.getNativeString()`. (Bug #5706)
- `UNSIGNED BIGINT` unpacked incorrectly from server-side prepared statement result sets. (Bug #5729)
- Use null-safe-equals for key comparisons in updatable result sets. (Bug #6225)
- Failing to connect to the server when one of the addresses for the given host name is IPV6 (which the server does not yet bind on). The driver now loops through *all* IP addresses for a given host, and stops on the first one that `accepts()` a `socket.connect()`. (Bug #6348)
- `ResultSetMetaData.getColumnDisplaySize()` returns incorrect values for multi-byte charsets. (Bug #6399)
- `SUM()` on `DECIMAL` with server-side prepared statement ignores scale if zero-padding is needed (this ends up being due to conversion to `DOUBLE` by server, which when converted to a string to parse into `BigDecimal`, loses all “padding” zeros). (Bug #6537)
- Use a per-session `Calendar` instance by default when decoding dates from `ServerPreparedStatements` (set to old, less performant behavior by setting property `dynamicCalendars=true`). (Bug #5706)
- Handle case when string representation of timestamp contains trailing “`.`” with no numbers following it. (Bug #5235)
- Use `DatabaseMetaData.getIdentifierQuoteString()` when building DBMD queries. (Bug #6537)
- Re-work `Field.isOpaqueBinary()` to detect `CHAR(`*n*`) CHARACTER SET BINARY` to support fixed-length binary fields for `ResultSet.getObject()`. (Bug #6399)
- Server-side prepared statements did not honor `zeroDateTimeBehavior` property, and would cause class-cast exceptions when using `ResultSet.getObject()`, as the all-zero string was always returned. (Bug #5235)
- Fixed too-early creation of `StringBuffer` in `EscapeProcessor.escapeSQL()`, also return `String` when escaping not needed (to avoid unnecessary object allocations). Found while profiling for Bug #6359. (Bug #6225)
- Fix comparisons made between string constants and dynamic strings that are converted with either `toUpperCase()` or `toLowerCase()` to use `Locale.ENGLISH`, as some locales “override” case rules for English. Also use `StringUtils.indexOfIgnoreCase()` instead of `.toUpperCase().indexOf()`, avoids creating a very short-lived transient `String` instance.

Changes in MySQL Connector/J 3.1.4 (2004-09-04)

Bugs Fixed

- Fixed `ServerPreparedStatement` to read prepared statement metadata off the wire, even though it is currently a placeholder instead of using `MysqlIO.clearInputStream()`

which didn't work at various times because data wasn't available to read from the server yet. This fixes sporadic errors users were having with `ServerPreparedStatements` throwing `ArrayIndexOutOfBoundExceptions`. (Bug #5032)

- Optimized integer number parsing, enable “old” slower integer parsing using JDK classes using `useFastIntParsing=false` property. (Bug #4642)
- Track packet sequence numbers if `enablePacketDebug=true`, and throw an exception if packets received out-of-order. (Bug #4689)
- `ResultSet.wasNull()` does not work for primitives if a previous `null` was returned. (Bug #4689)
- Added three ways to deal with all-zero datetimes when reading them from a `ResultSet`: `exception` (the default), which throws an `SQLException` with an SQLState of `S1009`; `convertToNull`, which returns `NULL` instead of the date; and `round`, which rounds the date to the nearest closest value which is `'0001-01-01'`. (Bug #5032)
- Added `useOnlyServerErrorMessages` property, which causes message text in exceptions generated by the server to only contain the text sent by the server (as opposed to the SQLState's “standard” description, followed by the server's error message). This property is set to `true` by default. (Bug #4642)
- The driver is more strict about truncation of numerics on `ResultSet.get*()`, and will throw an `SQLException` when truncation is detected. You can disable this by setting `jdbcCompliantTruncation` to `false` (it is enabled by default, as this functionality is required for JDBC compliance). (Bug #5032)
- `ResultSet.getObject()` returns wrong type for strings when using prepared statements. (Bug #4482)
- `ServerPreparedStatements` dealing with return of `DECIMAL` type don't work. (Bug #5012)
- Calling `MysqlPooledConnection.close()` twice (even though an application error), caused NPE. Fixed. (Bug #4482)
- Connector/J 3.1.3 beta does not handle integers correctly (caused by changes to support unsigned reads in `Buffer.readInt()` -> `Buffer.readShort()`). (Bug #4510)
- You can now use URLs in `LOAD DATA LOCAL INFILE` statements, and the driver will use Java's built-in handlers for retrieving the data and sending it to the server. This feature is not enabled by default, you must set the `allowUrlInLocalInfile` connection property to `true`. (Bug #5032)
- Added support in `DatabaseMetaData.getTables()` and `getTableTypes()` for views, which are now available in MySQL server 5.0.x. (Bug #4510)
- `ServerPreparedStatement.execute*()` sometimes threw `ArrayIndexOutOfBoundsException` when unpacking field metadata. (Bug #4642)
- `ResultSet.getObject()` doesn't return type `Boolean` for pseudo-bit types from prepared statements on 4.1.x (shortcut for avoiding extra type conversion when using binary-encoded result sets obscured test in `getObject()` for “pseudo” bit type). (Bug #5032)
- Use `com.mysql.jdbc.Message`'s classloader when loading resource bundle, should fix sporadic issues when the caller's classloader can't locate the resource bundle. (Bug #5032)

Changes in MySQL Connector/J 3.1.3 (2004-07-07)

Bugs Fixed

- Externalized more messages (on-going effort). (Bug #4119)
- Support new time zone variables in MySQL-4.1.3 when `useTimezone=true`. (Bug #4311)

- Null bitmask sent for server-side prepared statements was incorrect. (Bug #4119)
- Added constants for MySQL error numbers (publicly accessible, see `com.mysql.jdbc.MysqlErrorNumbers`), and the ability to generate the mappings of vendor error codes to SQLStates that the driver uses (for documentation purposes). (Bug #4119)
- Added packet debugging code (see the `enablePacketDebug` property documentation). (Bug #4119)
- Error in retrieval of `mediumint` column with prepared statements and binary protocol. (Bug #4311)
- Use SQL Standard SQL states by default, unless `useSqlStateCodes` property is set to `false`. (Bug #4119)
- Support for unsigned numerics as return types from prepared statements. This also causes a change in `ResultSet.getObject()` for the `bigint unsigned` type, which used to return `BigDecimal` instances, it now returns instances of `java.lang.BigInteger`. (Bug #4311)
- Added support for `INOUT` parameters in `CallableStatements`.
- Mangle output parameter names for `CallableStatements` so they will not clash with user variable names.

Changes in MySQL Connector/J 3.1.2 (2004-06-09)

Bugs Fixed

- Fixed `DatabaseMetaData.getProcedures()` when run on MySQL-5.0.0 (output of `SHOW PROCEDURE STATUS` changed between 5.0.0 and 5.0.1. (Bug #3520)
- Fixed case when no output parameters specified for a stored procedure caused a bogus query to be issued to retrieve out parameters, leading to a syntax error from the server.
- Correctly map output parameters to position given in `prepareCall()` versus. order implied during `registerOutParameter()`. (Bug #3146)
- Added `connectionCollation` property to cause driver to issue `set collation_connection=...` query on connection init if default collation for given charset is not appropriate. (Bug #3520)
- `ServerPreparedStatements` weren't actually de-allocating server-side resources when `.close()` was called.
- Don't enable server-side prepared statements for server version 5.0.0 or 5.0.1, as they aren't compatible with the '4.1.2+' style that the driver uses (the driver expects information to come back that isn't there, so it hangs). (Bug #3804)
- `getProcedures()` does not return any procedures in result set. (Bug #3539)
- Fixed stored procedure parameter parsing info when size was specified for a parameter (for example, `char()`, `varchar()`).
- Removed wrapping of exceptions in `MysqlIO.changeUser()`.
- `getWarnings()` returns `SQLWarning` instead of `DataTruncation`. (Bug #3804)
- Cleaned up detection of server properties. (Bug #3146)
- Correctly detect initial character set for servers >= 4.1.0. (Bug #3146)
- Support placeholder for parameter metadata for server >= 4.1.2. (Bug #3146)
- Added `logSlowQueries` property, along with `slowQueriesThresholdMillis` property to control when a query should be considered “slow.”

- Added `.toString()` functionality to `ServerPreparedStatement`, which should help if you're trying to debug a query that is a prepared statement (it shows SQL as the server would process).
- Fixed sending of split packets for large queries, enabled nio ability to send large packets as well.
- Enabled callable statement caching using `cacheCallableStmts` property.
- Fixed case when no parameters could cause a `NullPointerException` in `CallableStatement.setOutputParameters()`.
- Added `gatherPerformanceMetrics` property, along with properties to control when/where this info gets logged (see docs for more info).
- `DBMD.getSQLStateType()` returns incorrect value. (Bug #3520)
- `getProcedureColumns()` doesn't work with wildcards for procedure name. (Bug #3540)

Changes in MySQL Connector/J 3.1.1 (2004-02-14, alpha)

Bugs Fixed

- Fixed charset conversion issue in `getTables()`. (Bug #2502)
- Fixed `ConnectionProperties` that weren't properly exposed through accessors, cleaned up `ConnectionProperties` code. (Bug #2623)
- Prepared `Statements` will be re-prepared on auto-reconnect. Any errors encountered are postponed until first attempt to re-execute the re-prepared statement.
- Reduced number of methods called in average query to be more efficient.
- Refactored how connection properties are set and exposed as `DriverPropertyInfo` as well as `Connection` and `DataSource` properties.
- Fixed stack overflow in `Connection.prepareCall()` (bad merge).
- Enabled streaming of result sets from server-side prepared statements. (Bug #2606)
- Allow contents of `PreparedStatement.setBlob()` to be retained between calls to `.execute*()`.
- Fixed `IllegalAccessError` to `Calendar.getTimeInMillis()` in `DateTimeValue` (for JDK < 1.4).
- Default result set type changed to `TYPE_FORWARD_ONLY` (JDBC compliance).
- Fixed bug with `UpdatableResultSets` not using client-side prepared statements.
- Class-cast exception when using scrolling result sets and server-side prepared statements. (Bug #2623)
- Display where/why a connection was implicitly closed (to aid debugging). (Bug #1673)
- `DatabaseMetaData.getColumns()` is not returning correct column ordinal info for non-`'%'` column name patterns. (Bug #1673)
- Centralized setting of result set type and concurrency.
- Implemented `Connection.prepareCall()`, and `DatabaseMetaData`. `getProcedures()` and `getProcedureColumns()`. (Bug #2359)
- Implemented multiple result sets returned from a statement or stored procedure. (Bug #2502)

- Fixed `NullPointerException` in `ServerPreparedStatement.setTimestamp()`, as well as year and month discrepencies in `ServerPreparedStatement.setTimestamp()`, `setDate()`. (Bug #1673)
- Fixed character encoding issues when converting bytes to ASCII when MySQL doesn't provide the character set, and the JVM is set to a multi-byte encoding (usually affecting retrieval of numeric values).
- Support “old” `profileSql` capitalization in `ConnectionProperties`. This property is deprecated, you should use `profileSQL` if possible.
- Added ability to have multiple database/JVM targets for compliance and regression/unit tests in `build.xml`. (Bug #1673)
- Support for transaction savepoints (MySQL >= 4.0.14 or 4.1.1).
- Check for closed connection on delete/update/insert row operations in `UpdatableResultSet`.
- Support for NIO. Use `useNIO=true` on platforms that support NIO.
- Fixed sending of queries larger than 16M. (Bug #1673)
- Use DocBook version of docs for shipped versions of drivers. (Bug #2671)
- Merged fix of data type mapping from MySQL type `FLOAT` to `java.sql.Types.REAL` from 3.0 branch. (Bug #1673)
- Merged prepared statement caching, and `.getMetaData()` support from 3.0 branch. (Bug #2359)
- Fixed NPE and year/month bad conversions when accessing some datetime functionality in `ServerPreparedStatements` and their resultant result sets. (Bug #1673)
- Removed `useFastDates` connection property.
- Added named and indexed input/output parameter support to `CallableStatement`. MySQL-5.0.x or newer. (Bug #1673)
- Fixed off-by-1900 error in some cases for years in `TimeUtil.fastDate`/`TimeCreate()` when unpacking results from server-side prepared statements. (Bug #2359)
- Support for `mysql_change_user()`. See the `changeUser()` method in `com.mysql.jdbc.Connection`.
- `DatabaseMetaData` now reports `supportsStoredProcedures()` for MySQL versions >= 5.0.0
- Deal with 0-length tokens in `EscapeProcessor` (caused by callable statement escape syntax).
- Reset `long binary` parameters in `ServerPreparedStatement` when `clearParameters()` is called, by sending `COM_RESET_STMT` to the server. (Bug #2359)
- Server-side prepared statements were not returning data type `YEAR` correctly. (Bug #2606)
- `NULL` fields were not being encoded correctly in all cases in server-side prepared statements. (Bug #2671)
- Implemented long data (Blobs, Clobs, InputStreams, Readers) for server prepared statements.
- Correctly initialize datasource properties from JNDI Refs, including explicitly specified URLs.
- Ensure that warnings are cleared before executing queries on prepared statements, as-per JDBC spec (now that we support warnings).
- Implemented `Statement.getWarnings()` for MySQL-4.1 and newer (using `SHOW WARNINGS`).

- Unpack “unknown” data types from server prepared statements as `Strings`.
- `NULL` values for numeric types in binary encoded result sets causing `NullPointerExceptions`. (Bug #2359)
- `CommunicationsException` implemented, that tries to determine why communications was lost with a server, and displays possible reasons when `.getMessage()` is called. (Bug #1673)
- Fixed rare buffer underflow when writing numbers into buffers for sending prepared statement execution requests. (Bug #2671)
- Fix support for table aliases when checking for all primary keys in `UpdatableResultSet`.
- Optimized `Buffer.readLenByteArray()` to return shared empty byte array when length is 0.
- Detect collation of column for `RSMD.isCaseSensitive()`. (Bug #1673)
- Merged unbuffered input code from 3.0. (Bug #2623)

Changes in MySQL Connector/J 3.1.0 (2003-02-18, alpha)

Bugs Fixed

- Track open `Statements`, close all when `Connection.close()` is called (JDBC compliance).
- Added `requireSSL` property.
- Added `useServerPrepStmts` property (default `false`). The driver will use server-side prepared statements when the server version supports them (4.1 and newer) when this property is set to `true`. It is currently set to `false` by default until all bind/fetch functionality has been implemented. Currently only DML prepared statements are implemented for 4.1 server-side prepared statements.

Changes in MySQL Connector/J 3.0.x

Changes in MySQL Connector/J 3.0.17 (2005-06-23)

Bugs Fixed

- `PreparedStatement.fixDecimalExponent()` adding extra `+`, making number unparseable by MySQL server. (Bug #7061)
- Workaround for server Bug #9098: Default values of `CURRENT_*` for `DATE`, `TIME`, `DATETIME`, and `TIMESTAMP` columns can't be distinguished from `string` values, so `UpdatableResultSet.moveToInsertRow()` generates bad SQL for inserting default values. (Bug #8812)
- Handle streaming result sets with more than 2 billion rows properly by fixing wraparound of row number counter. (Bug #7601)
- Fixed duplicated code in `configureClientCharset()` that prevented `useOldUTF8Behavior=true` from working properly. (Bug #7952)
- Statements created from a pooled connection were returning physical connection instead of logical connection when `getConnection()` was called. (Bug #7316)
- `MS932`, `SHIFT_JIS`, and `Windows_31J` not recognized as aliases for `sjis`. (Bug #7607)
- `EUCKR` charset is sent as `SET NAMES euc_kr` which MySQL-4.1 and newer doesn't understand. (Bug #8629)
- Support new protocol type `MYSQL_TYPE_VARCHAR`. (Bug #7081)

- Connections starting up failed-over (due to down master) never retry master. (Bug #6966)
- `PreparedStatements` don't encode Big5 (and other multi-byte) character sets correctly in static SQL strings. (Bug #7033)
- `PreparedStatement.fixDecimalExponent()` adding extra `+`, making number unparseable by MySQL server. (Bug #7601)
- Backported SQLState codes mapping from Connector/J 3.1, enable with `useSqlStateCodes=true` as a connection property, it defaults to `false` in this release, so that we don't break legacy applications (it defaults to `true` starting with Connector/J 3.1). (Bug #7686)
- Added `useOldUTF8Behavior`' configuration property, which causes JDBC driver to act like it did with MySQL-4.0.x and earlier when the character encoding is `utf-8` when connected to MySQL-4.1 or newer. (Bug #7081)
- Escape sequence {fn convert(..., type)} now supports ODBC-style types that are prepended by `SQL_`. (Bug #7601)
- Added support for the `EUC_JP_Solaris` character encoding, which maps to a MySQL encoding of `eucjpms` (backported from 3.1 branch). This only works on servers that support `eucjpms`, namely 5.0.3 or later. (Bug #8629)
- `NON_UNIQUE` column from `DBMD.getIndexInfo()` returned inverted value. (Bug #8812)
- Use hex escapes for `PreparedStatement.setBytes()` for double-byte charsets including “aliases” `Windows-31J`, `CP934`, `MS932`. (Bug #8629)
- Timestamp key column data needed `_binary` stripped for `UpdatableResultSet.refreshRow()`. (Bug #7686)
- `DatabaseMetaData.getIndexInfo()` ignored `unique` parameter. (Bug #7081)
- `DatabaseMetaData.supportsSelectForUpdate()` returns correct value based on server version. (Bug #8629)
- Which requires hex escaping of binary data when using multi-byte charsets with prepared statements. (Bug #8064)
- `Timestamp`/`Time` conversion goes in the wrong “direction” when `useTimeZone=true` and server time zone differs from client time zone. (Bug #5874)
- Adding `CP943` to aliases for `sjis`. (Bug #6549, Bug #7607)

Changes in MySQL Connector/J 3.0.16 (2004-11-15)

Bugs Fixed

- Made `TINYINT(1)` -> `BIT`/`Boolean` conversion configurable using `tinyInt1isBit` property (default `true` to be JDBC compliant out of the box). (Bug #5664)
- Off-by-one bug in `Buffer.readString(`*`string`*`)`. (Bug #5664)
- `ResultSet.updateByte()` when on insert row throws `ArrayOutOfBoundsException`. (Bug #5664)
- Fixed regression where `useUnbufferedInput` was defaulting to `false`. (Bug #5664)
- `ResultSet.getTimestamp()` on a column with `TIME` in it fails. (Bug #5664)
- Fixed `DatabaseMetaData.getTypes()` returning incorrect (this is, nonnegative) scale for the `NUMERIC` type. (Bug #5664)

- Only set `character_set_results` [465] during connection establishment if server version >= 4.1.1. (Bug #5664)
- Re-issue character set configuration commands when re-using pooled connections or `Connection.changeUser()` when connected to MySQL-4.1 or newer.
- Fixed `ResultSetMetaData.isReadOnly()` to detect nonwritable columns when connected to MySQL-4.1 or newer, based on existence of “original” table and column names.

Changes in MySQL Connector/J 3.0.15 (2004-09-04)

Bugs Fixed

- Calling `.close()` twice on a `PooledConnection` causes NPE. (Bug #4808)
- “Production” is now “GA” (General Availability) in naming scheme of distributions. (Bug #4860, Bug #4138)
- `DOUBLE` mapped twice in `DBMD.getTypeInfo()`. (Bug #4742)
- Removed redundant calls to `checkRowPos()` in `ResultSet`. (Bug #4334)
- `DBMD.getColumns()` returns incorrect JDBC type for unsigned columns. This affects type mappings for all numeric types in the `RSMD.getColumnType()` and `RSMD.getColumnTypeNames()` methods as well, to ensure that “like” types from `DBMD.getColumns()` match up with what `RSMD.getColumnType()` and `getColumnTypeNames()` return. (Bug #4860, Bug #4138)
- `ResultSet.getMetaData()` should not return incorrectly initialized metadata if the result set has been closed, but should instead throw an `SQLException`. Also fixed for `getRow()` and `getWarnings()` and traversal methods by calling `checkClosed()` before operating on instance-level fields that are nullified during `.close()`. (Bug #5069)
- `RSMD.getPrecision()` returning 0 for nonnumeric types (should return max length in chars for nonbinary types, max length in bytes for binary types). This fix also fixes mapping of `RSMD.getColumnType()` and `RSMD.getColumnTypeName()` for the `BLOB` types based on the length sent from the server (the server doesn't distinguish between `TINYBLOB`, `BLOB`, `MEDIUMBLOB` or `LONGBLOB` at the network protocol level). (Bug #4880)
- Added FLOSS license exemption. (Bug #4742)
- `ResultSet` should release `Field[]` instance in `.close()`. (Bug #5022)
- Failover for `autoReconnect` not using port numbers for any hosts, and not retrying all hosts.

  Warning

  This required a change to the `SocketFactory connect()` method signature, which is now `public Socket connect(String host, int portNumber, Properties props)`; therefore, any third-party socket factories will have to be changed to support this signature.

  (Bug #4334)
- Use `_binary` introducer for `PreparedStatement.setBytes()` and `set*Stream()` when connected to MySQL-4.1.x or newer to avoid misinterpretation during character conversion. (Bug #5069)
- Logical connections created by `MysqlConnectionPoolDataSource` will now issue a `rollback()` when they are closed and sent back to the pool. If your application server/connection pool already does this for you, you can set the `rollbackOnPooledClose` property to `false` to avoid the overhead of an extra `rollback()`. (Bug #4334)

- Parse new time zone variables from 4.1.x servers. (Bug #5069)
- `StringUtils.escapeEasternUnicodeByteStream` was still broken for GBK. (Bug #4010)

Changes in MySQL Connector/J 3.0.14 (2004-05-28)

Bugs Fixed

- Fixed URL parsing error.

Changes in MySQL Connector/J 3.0.13 (2004-05-27)

Bugs Fixed

- Using a `MySQLDatasource` without server name fails. (Bug #3848)
- `PreparedStatement.getGeneratedKeys()` method returns only 1 result for batched insertions. (Bug #3873)
- `No Database Selected` when using `MysqlConnectionPoolDataSource`. (Bug #3920)

Changes in MySQL Connector/J 3.0.12 (2004-05-18)

Bugs Fixed

- Backported “change user” and “reset server state” functionality from 3.1 branch, to enable clients of `MysqlConnectionPoolDataSource` to reset server state on `getConnection()` on a pooled connection.
- Made `StringRegressionTest` 4.1-unicode aware. (Bug #3520)
- Use `SET character_set_results` during initialization to enable any charset to be returned to the driver for result sets. (Bug #2670)
- Fixed regression in `PreparedStatement.setString()` and eastern character encodings. (Bug #3520)
- Don't truncate `BLOB` or `CLOB` values when using `setBytes()` and `setBinary/CharacterStream()`. (Bug #2670)
- Map duplicate key and foreign key errors to SQLState of `23000`.
- Allow `java.util.Date` to be sent in as parameter to `PreparedStatement.setObject()`, converting it to a `Timestamp` to maintain full precision. . (Bug #103)
- Add unsigned attribute to `DatabaseMetaData.getColumns()` output in the `TYPE_NAME` column.
- Not specifying database in URL caused `MalformedURL` exception. (Bug #3554)
- Added `failOverReadOnly` property, to enable the user to configure the state of the connection (read-only/writable) when failed over.
- Dynamically configure character set mappings for field-level character sets on MySQL-4.1.0 and newer using `SHOW COLLATION` when connecting. (Bug #2670)
- Map `binary` character set to `US-ASCII` to support `DATETIME` charset recognition for servers >= 4.1.2. (Bug #2670)
- Inconsistent reporting of data type. The server still doesn't return all types for *BLOBs *TEXT correctly, so the driver won't return those correctly. (Bug #3570)
- Auto-convert MySQL encoding names to Java encoding names if used for `characterEncoding` property. (Bug #3554)

- Backport documentation tooling from 3.1 branch.
- Use `junit.textui.TestRunner` for all unit tests (to enable them to be run from the command line outside of Ant or Eclipse). (Bug #3554)
- Renamed `StringUtils.escapeSJISByteStream()` to more appropriate `escapeEasternUnicodeByteStream()`. (Bug #3511)
- Use `charsetnr` returned during connect to encode queries before issuing `SET NAMES` on MySQL >= 4.1.0. (Bug #2670)
- `StringUtils.escapeSJISByteStream()` not covering all eastern double-byte charsets correctly. (Bug #3511)
- `DBMD.getSQLStateType()` returns incorrect value. (Bug #3520)
- Add helper methods to `ResultSetMetaData` (`getColumnCharacterEncoding()` and `getColumnCharacterSet()`) to permit end users to see what charset the driver thinks it should be using for the column. (Bug #2670)
- Don't escape SJIS/GBK/BIG5 when using MySQL-4.1 or newer.
- Added encoding names that are recognized on some JVMs to fix case where they were reverse-mapped to MySQL encoding names incorrectly. (Bug #3554)
- Only set `character_set_results` [465] for MySQL >= 4.1.0. (Bug #2670)
- Return creating statement for `ResultSets` created by `getGeneratedKeys()`. (Bug #2957)
- `UpdatableResultSet` not picking up default values for `moveToInsertRow()`. (Bug #3557)
- Allow `url` parameter for `MysqlDataSource` and `MysqlConnectionPool DataSource` so that passing of other properties is possible from inside appservers.

Changes in MySQL Connector/J 3.0.11 (2004-02-19)

Bugs Fixed

- Return `java.lang.Integer` for `TINYINT` and `SMALLINT` types from `ResultSetMetaData.getColumnClassName()`. (Bug #2852)
- Return `java.lang.Double` for `FLOAT` type from `ResultSetMetaData.getColumnClassName()`. (Bug #2855)
- Added `useUnbufferedInput` parameter, and now use it by default (due to JVM issue http://developer.java.sun.com/developer/bugParade/bugs/4401235.html) (Bug #2578)
- `AutoReconnect` time was growing faster than exponentially. (Bug #2447)
- Fixed failover always going to last host in list. (Bug #2578)
- Detect `on`/`off` or `1`, `2`, `3` form of `lower_case_table_names` [492] value on server. (Bug #2578)
- Return `[B` instead of `java.lang.Object` for `BINARY`, `VARBINARY` and `LONGVARBINARY` types from `ResultSetMetaData.getColumnClassName()` (JDBC compliance). (Bug #2855)
- Issue connection events on all instances created from a `ConnectionPoolDataSource`. (Bug #2855)
- Trigger a `SET NAMES utf8` when encoding is forced to `utf8` *or* `utf-8` using the `characterEncoding` property. Previously, only the Java-style encoding name of `utf-8` would trigger this.

Changes in MySQL Connector/J 3.0.10 (2004-01-13)

Bugs Fixed

- Fixed regression of `Statement.getGeneratedKeys()` and `REPLACE` statements. (Bug #1576)
- Implement `ResultSet.updateClob()`. (Bug #1913)
- Enable caching of the parsing stage of prepared statements using the `cachePrepStmts`, `prepStmtCacheSize`, and `prepStmtCacheSqlLimit` properties (disabled by default). (Bug #2006)
- Foreign Keys column sequence is not consistent in `DatabaseMetaData.getImported/Exported/CrossReference()`. (Bug #1731)
- Subsequent call to `ResultSet.updateFoo()` causes NPE if result set is not updatable. (Bug #1630)
- Backported fix for aliased tables and `UpdatableResultSets` in `checkUpdatability()` method from 3.1 branch. (Bug #1534)
- Fixed security exception when used in Applets (applets can't read the system property `file.encoding` which is needed for `LOAD DATA LOCAL INFILE`). (Bug #2006)
- Speed up parsing of `PreparedStatements`, try to use one-pass whenever possible. (Bug #2006)
- Support escape sequence {fn convert ... }. (Bug #1914)
- Autoreconnect code didn't set catalog upon reconnect if it had been changed. (Bug #1913)
- Fixed exception `Unknown character set 'danish'` on connect with JDK-1.4.0 (Bug #2006)
- Fixed mappings in SQLError to report deadlocks with SQLStates of `41000`. (Bug #2006)
- `ResultSet.getObject()` on `TINYINT` and `SMALLINT` columns should return Java type `Integer`. (Bug #1913)
- `ArrayIndexOutOfBounds` when parameter number == number of parameters + 1. (Bug #1958)
- Added more descriptive error message `Server Configuration Denies Access to DataSource`, as well as retrieval of message from server. (Bug #1913)
- “Friendlier” exception message for `PacketTooLargeException`. (Bug #1534)
- Don't count quoted IDs when inside a 'string' in `PreparedStatement` parsing. (Bug #1511)
- Removed static synchronization bottleneck from instance factory method of `SingleByteCharsetConverter`. (Bug #2006)
- Removed static synchronization bottleneck from `PreparedStatement.setTimestamp()`. (Bug #2006)
- `ResultSet.findColumn()` should use first matching column name when there are duplicate column names in `SELECT` query (JDBC-compliance). (Bug #2006)
- `maxRows` property would affect internal statements, so check it for all statement creation internal to the driver, and set to 0 when it is not. (Bug #2006)
- Barge blobs and split packets not being read correctly. (Bug #1576)
- `ResultSetMetaData.isCaseSensitive()` returned wrong value for `CHAR`/`VARCHAR` columns. (Bug #1913)

- `DatabaseMetaData.getSystemFunction()` returning bad function `VResultsSion`. (Bug #1775)
- Use constants for SQLStates. (Bug #2006)
- Fix for 4.1.1-style authentication with no password. (Bug #1630)
- Cross-database updatable result sets are not checked for updatability correctly. (Bug #1592)
- Statements being created too many times in `DBMD.extractForeignKeyFromCreateTable()`. (Bug #1925)
- Map charset `ko18_ru` to `ko18r` when connected to MySQL-4.1.0 or newer. (Bug #2006)
- Fix for `ArrayIndexOutOfBounds` exception when using `Statement.setMaxRows()`. (Bug #1695)
- Connection property `maxRows` not honored. (Bug #1933)
- Added `alwaysClearStream` connection property, which causes the driver to always empty any remaining data on the input stream before each query. (Bug #1913)
- `DatabaseMetaData.getColumns()` should return `Types.LONGVARCHAR` for MySQL `LONGTEXT` type. (Bug #1592)
- Ensure that `Buffer.writeString()` saves room for the `\0`. (Bug #2006)

Changes in MySQL Connector/J 3.0.9 (2003-10-07)

Bugs Fixed

- Issue exception on `ResultSet.get`*`XXX`*`()` on empty result set (wasn't caught in some cases). (Bug #848)
- Made `databaseName`, `portNumber`, and `serverName` optional parameters for `MysqlDataSourceFactory`. (Bug #1246)
- `ResultSet.get/setString` mashing char 127. (Bug #1247)
- Double-escaping of `'\'` when charset is SJIS or GBK and `'\'` appears in nonescaped input. (Bug #879)
- Don't hide messages from exceptions thrown in I/O layers. (Bug #848)
- Support `InnoDB` constraint names when extracting foreign key information in `DatabaseMetaData` (implementing ideas from Parwinder Sekhon). (Bug #664, Bug #517)
- Fixed `CLOB.truncate()`. (Bug #1130)
- Fixed `ResultSet.previous()` behavior to move current position to before result set when on first row of result set. (Bug #496)
- Backported 4.1 protocol changes from 3.1 branch (server-side SQL states, new field information, larger client capability flags, connect-with-database, and so forth). (Bug #664, Bug #517)
- Fixed `Statement` and `PreparedStatement` issuing bogus queries when `setMaxRows()` had been used and a `LIMIT` clause was present in the query. (Bug #496)
- Added property to “clobber” streaming results, by setting the `clobberStreamingResults` property to `true` (the default is `false`). This will cause a “streaming” `ResultSet` to be automatically closed, and any outstanding data still streaming from the server to be discarded if another query is executed before all the data has been read from the server. (Bug #1247)

- When emptying input stream of unused rows for “streaming” result sets, have the current thread `yield()` every 100 rows to not monopolize CPU time. (Bug #879)
- Fixed deadlock issue with `Statement.setMaxRows()`. (Bug #1099)
- Don't wrap `SQLExceptions` in `RowDataDynamic`. (Bug #688)
- Added `com.mysql.jdbc.util.BaseBugReport` to help creation of testcases for bug reports. (Bug #1247)
- Clip +/- INF (to smallest and largest representative values for the type in MySQL) and NaN (to 0) for `setDouble`/`setFloat()`, and issue a warning on the statement when the server does not support +/- INF or NaN. (Bug #884)
- Don't try and reset isolation level on reconnect if MySQL doesn't support them. (Bug #688)
- `DatabaseMetaData.getColumns()` getting confused about the keyword “set” in character columns. (Bug #1099)
- Fixed regression in large split-packet handling. (Bug #848)
- Fixed test for end of buffer in `Buffer.readString()`.
- The `insertRow` in an `UpdatableResultSet` is now loaded with the default column values when `moveToInsertRow()` is called. (Bug #688)
- Better diagnostic error messages in exceptions for “streaming” result sets. (Bug #848)
- Backported authentication changes for 4.1.1 and newer from 3.1 branch. (Bug #1247)
- `DatabaseMetaData.getColumns()` wasn't returning `NULL` for default values that are specified as `NULL`. (Bug #688)
- Don't change timestamp TZ twice if `useTimezone==true`. (Bug #774)
- `refreshRow` didn't work when primary key values contained values that needed to be escaped (they ended up being doubly escaped). (Bug #661)
- Fix `UpdatableResultSet` to return values for `getXXX()` when on insert row. (Bug #675)
- Don't fire connection closed events when closing pooled connections, or on `PooledConnection.getConnection()` with already open connections. (Bug #884)
- Change default statement type/concurrency to `TYPE_FORWARD_ONLY` and `CONCUR_READ_ONLY` (spec compliance). (Bug #688)
- Faster date handling code in `ResultSet` and `PreparedStatement` (no longer uses `Date` methods that synchronize on static calendars).
- Optimized `CLOB.setChracterStream()`. (Bug #1131)

Changes in MySQL Connector/J 3.0.8 (2003-05-23)

Bugs Fixed

- Fixed SJIS encoding bug, thanks to Naoto Sato. (Bug #378)
- Allow bogus URLs in `Driver.getPropertyInfo()`.
- Fix problem detecting server character set in some cases. (Bug #378)
- Allow multiple calls to `Statement.close()`. (Bug #378)

- Return correct number of generated keys when using `REPLACE` statements. (Bug #378)
- Unicode character 0xFFFF in a string would cause the driver to throw an `ArrayOutOfBoundsException`. . (Bug #378)
- Return list of generated keys when using multi-value `INSERTS` with `Statement.getGeneratedKeys()`.
- Fixed result set not getting set for `Statement.executeUpdate()`, which affected `getGeneratedKeys()` and `getUpdateCount()` in some cases.
- Changed Ant target `compile-core` to `compile-driver`, and made testsuite compilation a separate target.
- Fix infinite loop with `Connection.cleanup()`.
- Fix row data decoding error when using *very* large packets. (Bug #378)
- Optimized row data decoding. (Bug #378)
- Use JVM charset with file names and `LOAD DATA [LOCAL] INFILE`.
- Issue exception when operating on an already closed prepared statement. (Bug #378)
- Optimized usage of `EscapeProcessor`. (Bug #378)

Changes in MySQL Connector/J 3.0.7 (2003-04-08)

Bugs Fixed

- Throw `SQLExceptions` when trying to do operations on a forcefully closed `Connection` (that is, when a communication link failure occurs).
- Fixed `ResultSet.getTimestamp()` when underlying field is of type `DATE`.
- Fixed escaping of 0x5c (`'\'`) character for GBK and Big5 charsets.
- Don't reset `Connection.isReadOnly()` when autoReconnecting.
- Ensure that packet size from `alignPacketSize()` does not exceed `max_allowed_packet` [493] (JVM bug)
- Don't pick up indexes that start with `pri` as primary keys for `DBMD.getPrimaryKeys()`.
- Fixed `LOAD DATA LOCAL INFILE` bug when file > `max_allowed_packet` [493].
- Updatable `ResultSets` can now be created for aliased tables/columns when connected to MySQL-4.1 or newer.
- Fixed missing conversion for `YEAR` type in `ResultSetMetaData.getColumnTypeName()`.
- Remove synchronization from `Driver.connect()` and `Driver.acceptsUrl()`.
- `IOExceptions` during a transaction now cause the `Connection` to be closed.
- Fixed `StringIndexOutOfBoundsException` in `PreparedStatement.setClob()`.
- Fixed `MysqlPooledConnection.close()` calling wrong event type.
- 4.1 Column Metadata fixes.
- You can now toggle profiling on/off using `Connection.setProfileSql(boolean)`.
- Fixed charset issues with database metadata (charset was not getting set correctly).

Changes in MySQL Connector/J 3.0.6 (2003-02-18)

Bugs Fixed

- Add “window” of different `NULL` sorting behavior to `DBMD.nullsAreSortedAtStart` (4.0.2 to 4.0.10, true; otherwise, no).
- Implemented `Blob.setBytes()`. You still need to pass the resultant `Blob` back into an updatable `ResultSet` or `PreparedStatement` to persist the changes, because MySQL does not support “locators”.
- More checks added in `ResultSet` traversal method to catch when in closed state.
- Fixed `ResultSetMetaData.isWritable()` to return correct value.
- Clean up `Statement` query/method mismatch tests (that is, `INSERT` not permitted with `.executeQuery()`).
- Allow ignoring of warning for “non transactional tables” during rollback (compliance/usability) by setting `ignoreNonTxTables` property to `true`.
- Fixed `ResultSetMetaData` to return `""` when catalog not known. Fixes `NullPointerExceptions` with Sun's `CachedRowSet`.
- Fixed `SQLExceptions` getting swallowed on initial connect.
- Fixed `DBMD.getTypeInfo()` and `DBMD.getColumns()` returning different value for precision in `TEXT` and `BLOB` types.
- Fixed `Statement.setMaxRows()` to stop sending `LIMIT` type queries when not needed (performance).
- Backported 4.1 charset field info changes from Connector/J 3.1.

Changes in MySQL Connector/J 3.0.5 (2003-01-22)

Bugs Fixed

- Greatly reduce memory required for `setBinaryStream()` in `PreparedStatements`.
- Retrieve `TX_ISOLATION` from database for `Connection.getTransactionIsolation()` when the MySQL version supports it, instead of an instance variable.
- Quote table names in `DatabaseMetaData.getColumns()`, `getPrimaryKeys()`, `getIndexInfo()`, `getBestRowIdentifier()`.
- Fixed `Buffer.fastSkipLenString()` causing `ArrayIndexOutOfBounds` exceptions with some queries when unpacking fields.
- Added update options for foreign key metadata.
- Implemented an empty `TypeMap` for `Connection.getTypeMap()` so that some third-party apps work with MySQL (IBM WebSphere 5.0 Connection pool).
- Added missing `LONGTEXT` type to `DBMD.getColumns()`.
- Fixed `ResultSet.isBeforeFirst()` for empty result sets.

Changes in MySQL Connector/J 3.0.4 (2003-01-06)

Bugs Fixed

- Added support for quoted identifiers in `PreparedStatement` parser.

- Added `strictUpdates` property to enable control of amount of checking for “correctness” of updatable result sets. Set this to `false` if you want faster updatable result sets and you know that you create them from `SELECT` statements on tables with primary keys and that you have selected all primary keys in your query.
- Reduce memory footprint of `PreparedStatements` by sharing outbound packet with `MysqlIO`.
- Added support for 4.0.8-style large packets.
- Added quoted identifiers to database names for `Connection.setCatalog`.
- Fixed `PreparedStatement.executeBatch()` parameter overwriting.
- Streamlined character conversion and `byte[]` handling in `PreparedStatements` for `setByte()`.

Changes in MySQL Connector/J 3.0.3 (2002-12-17)

Bugs Fixed

- Changed `SingleByteCharConverter` to use lazy initialization of each converter.
- Fixed `ResultSetMetaData.getPrecision()` returning incorrect values for some floating-point types.
- Check for connection closed in more `Connection` methods (`createStatement`, `prepareStatement`, `setTransactionIsolation`, `setAutoCommit`).
- Some MySQL-4.1 protocol support (extended field info from selects).
- More robust implementation of updatable result sets. Checks that *all* primary keys of the table have been selected.
- `DBMD.getImported/ExportedKeys()` now handles multiple foreign keys per table.
- Honor `lower_case_table_names` [492] when enabled in the server when doing table name comparisons in `DatabaseMetaData` methods.
- Added `CLIENT_LONG_FLAG` to be able to get more column flags (`isAutoIncrement()` being the most important).
- Substitute `'?'` for unknown character conversions in single-byte character sets instead of `'\0'`.
- Because of above, implemented `ResultSetMetaData.isAutoIncrement()` to use `Field.isAutoIncrement()`.
- Fixed charset handling in `Fields.java`.
- Fixed `ResultSetMetaData.getColumnTypeName()` returning `BLOB` for `TEXT` and `TEXT` for `BLOB` types.
- Implemented `Connection.nativeSQL()`.
- `LOAD DATA LOCAL INFILE ...` now works, if your server is configured to permit it. Can be turned off with the `allowLoadLocalInfile` property (see the `README`).
- Use nonaliased table/column names and database names to fully qualify tables and columns in `UpdatableResultSet` (requires MySQL-4.1 or newer).
- Changed `charsToByte` in `SingleByteCharConverter` to be nonstatic.
- `NamedPipeSocketFactory` now works (only intended for Windows), see `README` for instructions.
- Fixed `Buffer.isLastDataPacket()` for 4.1 and newer servers.

- More robust escape tokenizer: Recognize `--` comments, and permit nested escape sequences (see `testsuite.EscapeProcessingTest`).
- Allow user to alter behavior of `Statement`/ `PreparedStatement.executeBatch()` using `continueBatchOnError` property (defaults to `true`).

Changes in MySQL Connector/J 3.0.2 (2002-11-08)

Bugs Fixed

- Implemented `Clob.truncate()`.
- Properly restore connection properties when autoReconnecting or failing-over, including `autoCommit` state, and isolation level.
- Fixed issue when calling `Statement.setFetchSize()` when using arbitrary values.
- Added `queriesBeforeRetryMaster` property that specifies how many queries to issue when failed over before attempting to reconnect to the master (defaults to 50).
- Fixed `ResultSet.setFetchDirection(FETCH_UNKNOWN)`.
- Added driver property `useHostsInPrivileges`. Defaults to `true`. Affects whether or not `@hostname` will be used in `DBMD.getColumn/TablePrivileges`.
- Fixed `ResultSet.isLast()` for empty result sets (should return `false`).
- Fixed various non-ASCII character encoding issues.
- Added `connectTimeout` parameter that enables users of JDK-1.4 and newer to specify a maximum time to wait to establish a connection.
- Fixed start position off-by-1 error in `Clob.getSubString()`.
- Fixed issue with updatable result sets and `PreparedStatements` not working.
- `PreparedStatement` now honors stream lengths in setBinary/Ascii/Character Stream() unless you set the connection property `useStreamLengthsInPrepStmts` to `false`.
- Escape `0x5c` character in strings for the SJIS charset.
- Removed some not-needed temporary object creation by smarter use of `Strings` in `EscapeProcessor`, `Connection` and `DatabaseMetaData` classes.
- Implemented `ResultSet.updateBlob()`.
- Fixed incorrect conversion in `ResultSet.getLong()`.
- Fixed `UnsupportedEncodingException` thrown when “forcing” a character encoding using properties.
- Removed duplicate code from `UpdatableResultSet` (it can be inherited from `ResultSet`, the extra code for each method to handle updatability I thought might someday be necessary has not been needed).
- Implemented `Clob.setAsciiStream()`.
- Fixed `DBMD.supportsResultSetConcurrency()` so that it returns `true` for `ResultSet.TYPE_SCROLL_INSENSITIVE` and `ResultSet.CONCUR_READ_ONLY` or `ResultSet.CONCUR_UPDATABLE`.
- Failover and `autoReconnect` work only when the connection is in an `autoCommit(false)` state, to stay transaction-safe.

- Implemented `Clob.setCharacterStream()`.
- Use `SHOW CREATE TABLE` when possible for determining foreign key information for `DatabaseMetaData`. Also enables cascade options for `DELETE` information to be returned.
- All `DBMD` result set columns describing schemas now return `NULL` to be more compliant with the behavior of other JDBC drivers for other database systems (MySQL does not support schemas).
- Added SSL support. See `README` for information on how to use it.
- Added `com.mysql.jdbc.MiniAdmin` class, which enables you to send `shutdown` command to MySQL server. This is intended to be used when “embedding” Java and MySQL server together in an end-user application.
- Implemented `Clob.setString()`.

Changes in MySQL Connector/J 3.0.1 (2002-09-21)

Bugs Fixed

- Added `paranoid` parameter, which sanitizes error messages by removing “sensitive” information from them (such as host names, ports, or user names), as well as clearing “sensitive” data structures when possible.
- Added `LOCAL TEMPORARY` to table types in `DatabaseMetaData.getTableTypes()`.
- Added `socketTimeout` parameter to URL.
- `Connection.close()` issues `rollback()` when `getAutoCommit()` is `false`.
- `Connection.isClosed()` no longer “pings” the server.
- Added limited `Clob` functionality (`ResultSet.getClob()`, `PreparedStatement.setClob()`, `PreparedStatement.setObject(Clob)`.
- Implemented `ResultSet.getCharacterStream()`.
- Massive code clean-up to follow Java coding conventions (the time had come).
- Fixed `ResultSet.getRow()` off-by-one bug.
- Fixed `RowDataStatic.getAt()` off-by-one bug.
- Fixed `ResultSetMetaData.isSigned()` for `TINYINT` and `BIGINT`.
- Charsets now automatically detected. Optimized code for single-byte character set conversion.

Changes in MySQL Connector/J 3.0.0 (2002-07-31)

Bugs Fixed

- Performance enhancements: Driver is now 50–100% faster in most situations, and creates fewer temporary objects.
- **!!! LICENSE CHANGE !!!** The driver is now GPL.
- Overall speed improvements using controlling transient object creation in `MysqlIO` class when reading packets.
- JDBC-3.0 functionality including `Statement/PreparedStatement.getGeneratedKeys()` and `ResultSet.getURL()`.
- Performance improvements in string handling and field metadata creation (lazily instantiated) contributed by Alex Twisleton-Wykeham-Fiennes.

- Better checking for closed connections in `Statement` and `PreparedStatement`.
- Support for large packets (new addition to MySQL-4.0 protocol), see `README` for more information.
- Repackaging: New driver name is `com.mysql.jdbc.Driver`, old name still works, though (the driver is now provided by MySQL-AB).
- Added multi-host failover support (see `README`).
- `ResultSet.getDate/Time/Timestamp` now recognizes all forms of invalid values that have been set to all zeros by MySQL (SF bug 586058).
- JDBC Compliance: Passes all tests besides stored procedure tests.
- Testsuite now uses Junit (which you can get from http://www.junit.org.
- Support for streaming (row-by-row) result sets (see `README`) Thanks to Doron.
- Float types now reported as `java.sql.Types.FLOAT` (SF bug 579573).
- `ResultSet.getTimestamp()` now works for `DATE` types (SF bug 559134).
- Fix and sort primary key names in `DBMetaData` (SF bugs 582086 and 582086).
- The driver now only works with JDK-1.2 or newer.
- General source-code cleanup.

Changes in MySQL Connector/J 2.0.x

Changes in MySQL Connector/J 2.0.14 (2002-05-16)

Bugs Fixed

- Quoted identifiers not used if server version does not support them. Also, if server started with `--ansi` [418] or `--sql-mode=ANSI_QUOTES` [446], "`"` will be used as an identifier quote character, otherwise "`'`" will be used.
- More code cleanup.
- `PreparedStatement` now releases resources on `.close()`. (SF bug 553268)
- Added SQL profiling (to `STDERR`). Set `profileSql=true` in your JDBC URL. See `README` for more information.
- `LogicalHandle.isClosed()` calls through to physical connection.
- Fixed typo for `relaxAutoCommit` parameter.
- `ResultSet.getDouble()` now uses code built into JDK to be more precise (but slower).

Changes in MySQL Connector/J 2.0.13 (2002-04-24)

Bugs Fixed

- `ResultSetMetaData.getColumnClassName()` now implemented.
- `DBMetaData.getIndexInfo()` - bad PAGES fixed. (SF BUG 542201)
- Rudimentary version of `Statement.getGeneratedKeys()` from JDBC-3.0 now implemented (you need to be using JDK-1.4 for this to work, I believe).
- More code cleanup.

- `PreparedStatement.toString()` fixed. (SF bug 534026)
- Added `set`/`getPortNumber()` to `DataSource(s)`. (SF bug 548167)
- Added `setURL()` to `MySQLXADataSource`. (SF bug 546019)
- Faster blob escaping for `PrepStmt`.
- Fixed unicode chars being read incorrectly. (SF bug 541088)

Changes in MySQL Connector/J 2.0.12 (2002-04-07)

Bugs Fixed

- General code cleanup.
- Fixed `getRow()` bug (527165) in `ResultSet`.
- `ResultSet.refreshRow()` implemented.
- Added `getIdleFor()` method to `Connection` and `MysqlLogicalHandle`.
- Added `getTable/ColumnPrivileges()` to DBMD (fixes 484502).
- `ResultSet`: Fixed updatability (values being set to `null` if not updated).
- Fixes for `ResultSet` updatability in `PreparedStatement`.
- Added support for `YEAR` type (533556).
- `DataSources` - fixed `setUrl` bug (511614, 525565), wrong datasource class name (532816, 528767).
- Relaxed synchronization in all classes, should fix 520615 and 520393.
- `ResultSet.insertRow()` should now detect auto_increment fields in most cases and use that value in the new row. This detection will not work in multi-valued keys, however, due to the fact that the MySQL protocol does not return this information.
- Added support for `BIT` types (51870) to `PreparedStatement`.
- Added identifier quoting to all `DatabaseMetaData` methods that need them (should fix 518108).
- Fixed time zone off-by-1-hour bug in `PreparedStatement` (538286, 528785).
- Added new types to `getTypeInfo()`, fixed existing types thanks to Al Davis and Kid Kalanon.
- Fixed `testsuite.Traversal afterLast()` bug, thanks to Igor Lastric.

Changes in MySQL Connector/J 2.0.11 (2002-01-27)

Bugs Fixed

- More changes to fix `Unexpected end of input stream` errors when reading `BLOB` values. This should be the last fix.
- Fixed missing `DELETE_RULE` value in `DBMD.getImported/ExportedKeys()` and `getCrossReference()`.
- Full synchronization of `Statement.java`.

Changes in MySQL Connector/J 2.0.10 (2002-01-24)

Bugs Fixed

- Fixed spurious `Unexpected end of input stream` errors in `MysqlIO` (bug 507456).
- Fixed null-pointer-exceptions when using `MysqlConnectionPoolDataSource` with Websphere 4 (bug 505839).

Changes in MySQL Connector/J 2.0.9 (2002-01-13)

Bugs Fixed

- Full synchronization on methods modifying instance and class-shared references, driver should be entirely thread-safe now (please let me know if you have problems).
- Fixed off-by-one-hour error in `PreparedStatement.setTimestamp()` (bug 491577).
- Implementation of `DatabaseMetaData.getExported/ImportedKeys()` and `getCrossReference()`.
- Report batch update support through `DatabaseMetaData` (bug 495101).
- `Ant` build was corrupting included `jar` files, fixed (bug 487669).
- Removed concatenation support from driver (the `||` operator), as older versions of VisualAge seem to be the only thing that use it, and it conflicts with the logical `||` operator. You will need to start `mysqld` with the `--ansi` [418] flag to use the `||` operator as concatenation (bug 491680).
- Fixed quoting error with escape processor (bug 486265).
- `DataSource` implementations moved to `org.gjt.mm.mysql.jdbc2.optional` package, and (initial) implementations of `PooledConnectionDataSource` and `XADataSource` are in place (thanks to Todd Wolff for the implementation and testing of `PooledConnectionDataSource` with IBM WebSphere 4).
- Fixed casting bug in `PreparedStatement` (bug 488663).
- Added detection of network connection being closed when reading packets (thanks to Todd Lizambri).
- Fixed extra memory allocation in `MysqlIO.readPacket()` (bug 488663).

Changes in MySQL Connector/J 2.0.8 (2001-11-25)

Bugs Fixed

- `PreparedStatement.setAnyNumericType()` now handles positive exponents correctly (adds `+` so MySQL can understand it).
- Batch updates now supported (thanks to some inspiration from Daniel Rall).
- `DatabaseMetaData.getPrimaryKeys()` and `getBestRowIdentifier()` are now more robust in identifying primary keys (matches regardless of case or abbreviation/full spelling of `Primary Key` in `Key_type` column).
- `XADataSource`/`ConnectionPoolDataSource` code (experimental)

Changes in MySQL Connector/J 2.0.7 (2001-10-24)

Bugs Fixed

- Fixed `ResultSet.isAfterLast()` always returning `false`.
- PreparedStatement.setBoolean() will use 1/0 for values if your MySQL version is 3.21.23 or higher.
- Updatable result sets now correctly handle `NULL` values in fields.

- Fixed `DatabaseMetaData.supportsTransactions()`, and `supportsTransactionIsolationLevel()` and `getTypeInfo()` `SQL_DATETIME_SUB` and `SQL_DATA_TYPE` fields not being readable.
- PreparedStatement.setDouble() now uses full-precision doubles (reverting a fix made earlier to truncate them).
- Fixed time zone issue in `PreparedStatement.setTimestamp()`. (thanks to Erik Olofsson)
- Fixed dangling socket problem when in high availability (`autoReconnect=true`) mode, and finalizer for `Connection` will close any dangling sockets on GC.
- Fixed `ResultSetMetaData.getPrecision()` returning one less than actual on newer versions of MySQL.
- `ResultSet.getBlob()` now returns `null` if column value was `null`.
- Capitalize type names when `capitalizeTypeNames=true` is passed in URL or properties (for WebObjects. (thanks to Anjo Krank)
- `PreparedStatement.setCharacterStream()` now implemented
- Fixed `PreparedStatement` generating SQL that would end up with syntax errors for some queries.
- Initial transaction isolation level read from database (if available). (thanks to Dmitry Vereshchagin)
- Character sets read from database if `useUnicode=true` and `characterEncoding` is not set. (thanks to Dmitry Vereshchagin)

Changes in MySQL Connector/J 2.0.6 (2001-06-16)

Bugs Fixed

- Fixed case-sensitive column names in `ResultSet.java`.
- Fixed `PreparedStatement` parameter checking.

Changes in MySQL Connector/J 2.0.5 (2001-06-13)

Bugs Fixed

- Fixed `ResultSet.getBlob()` `ArrayIndex` out-of-bounds.
- Fixed NPE on `PreparedStatement.executeUpdate()` when all columns have not been set.
- Fixed `ArrayIndexOutOfBounds` when sending large `BLOB` queries. (Max size packet was not being set)
- Fixed `ResultSetMetaData.getColumnTypeName` for `TEXT`/`BLOB`.
- `getObject()` on `ResultSet` correctly does `TINYINT`->`Byte` and `SMALLINT`->`Short`.
- `ResultSet` has +/-Inf/inf support.
- `ResultSet.getBoolean()` now recognizes `-1` as `true`.
- `DataBaseMetaData.getCrossReference()` no longer `ArrayIndexOOB`.
- Added `ISOLATION` level support to `Connection.setIsolationLevel()`
- Fixed data parsing of `TIMESTAMP` values with 2-digit years.
- Added `Byte` to `PreparedStatement.setObject()`.

- `ResultSet.insertRow()` works now, even if not all columns are set (they will be set to `NULL`).

Changes in MySQL Connector/J 2.0.3 (2000-12-03)

Bugs Fixed

- Implemented `getBigDecimal()` without scale component for JDBC2.
- Added `ultraDevHack` URL parameter, set to `true` to enable (broken) Macromedia UltraDev to use the driver.
- Added detection of -/+INF for doubles.
- Fixed incorrect detection of `MAX_ALLOWED_PACKET`, so sending large blobs should work now.
- Fixed off-by-one error in `java.sql.Blob` implementation code.
- Faster ASCII string operations.
- Fixed composite key problem with updatable result sets.

Changes in MySQL Connector/J 2.0.1 (2000-04-06)

Bugs Fixed

- Fixed some issues with updatability support in `ResultSet` when using multiple primary keys.
- No escape processing is done on `PreparedStatements` anymore per JDBC spec.
- Fixed many JDBC-2.0 traversal, positioning bugs, especially with respect to empty result sets. Thanks to Ron Smits, Nick Brook, Cessar Garcia and Carlos Martinez.
- `DatabaseMetaData.getPrimaryKeys()` now works correctly with respect to `key_seq`. Thanks to Brian Slesinsky.
- Fixed `RSMD.isWritable()` returning wrong value. Thanks to Moritz Maass.
- Cleaned up exception handling when driver connects.
- Columns that are of type `TEXT` now return as `Strings` when you use `getObject()`.

Changes in MySQL Connector/J 2.0.0pre5 (21 February 2000)

- Fixed Bad Handshake problem.

Changes in MySQL Connector/J 2.0.0pre4 (10 January 2000)

- Fixes to ResultSet for insertRow() - Thanks to Cesar Garcia
- Fix to Driver to recognize JDBC-2.0 by loading a JDBC-2.0 class, instead of relying on JDK version numbers. Thanks to John Baker.
- Fixed ResultSet to return correct row numbers
- Statement.getUpdateCount() now returns rows matched, instead of rows actually updated, which is more SQL-92 like.

10-29-99

- Statement/PreparedStatement.getMoreResults() bug fixed. Thanks to Noel J. Bergman.
- Added Short as a type to PreparedStatement.setObject(). Thanks to Jeff Crowder
- Driver now automagically configures maximum/preferred packet sizes by querying server.

- Autoreconnect code uses fast ping command if server supports it.
- Fixed various bugs with respect to packet sizing when reading from the server and when alloc'ing to write to the server.

Changes in MySQL Connector/J 2.0.0pre (17 August 1999)

- Now compiles under JDK-1.2. The driver supports both JDK-1.1 and JDK-1.2 at the same time through a core set of classes. The driver will load the appropriate interface classes at runtime by figuring out which JVM version you are using.
- Fixes for result sets with all nulls in the first row. (Pointed out by Tim Endres)
- Fixes to column numbers in SQLExceptions in ResultSet (Thanks to Blas Rodriguez Somoza)
- The database no longer needs to specified to connect. (Thanks to Christian Motschke)

Changes in MySQL Connector/J 1.2.x and lower

Changes in MySQL Connector/J 1.2b (04 July 1999)

- Better Documentation (in progress), in doc/mm.doc/book1.html
- DBMD now permits null for a column name pattern (not in spec), which it changes to '%'.
- DBMD now has correct types/lengths for getXXX().
- ResultSet.getDate(), getTime(), and getTimestamp() fixes. (contributed by Alan Wilken)
- EscapeProcessor now handles \{ \} and { or } inside quotation marks correctly. (thanks to Alik for some ideas on how to fix it)
- Fixes to properties handling in Connection. (contributed by Juho Tikkala)
- ResultSet.getObject() now returns null for NULL columns in the table, rather than bombing out. (thanks to Ben Grosman)
- ResultSet.getObject() now returns Strings for types from MySQL that it doesn't know about. (Suggested by Chris Perdue)
- Removed DataInput/Output streams, not needed, 1/2 number of method calls per IO operation.
- Use default character encoding if one is not specified. This is a work-around for broken JVMs, because according to spec, EVERY JVM must support "ISO8859_1", but they do not.
- Fixed Connection to use the platform character encoding instead of "ISO8859_1" if one isn't explicitly set. This fixes problems people were having loading the character- converter classes that didn't always exist (JVM bug). (thanks to Fritz Elfert for pointing out this problem)
- Changed MysqlIO to re-use packets where possible to reduce memory usage.
- Fixed escape-processor bugs pertaining to {} inside quotation marks.

Changes in MySQL Connector/J 1.2a (14 April 1999)

- Fixed character-set support for non-Javasoft JVMs (thanks to many people for pointing it out)
- Fixed ResultSet.getBoolean() to recognize 'y' & 'n' as well as '1' & '0' as boolean flags. (thanks to Tim Pizey)
- Fixed ResultSet.getTimestamp() to give better performance. (thanks to Richard Swift)
- Fixed getByte() for numeric types. (thanks to Ray Bellis)

- Fixed DatabaseMetaData.getTypeInfo() for DATE type. (thanks to Paul Johnston)
- Fixed EscapeProcessor for "fn" calls. (thanks to Piyush Shah at locomotive.org)
- Fixed EscapeProcessor to not do extraneous work if there are no escape codes. (thanks to Ryan Gustafson)
- Fixed Driver to parse URLs of the form "jdbc:mysql://host:port" (thanks to Richard Lobb)

Changes in MySQL Connector/J 1.1i (24 March 1999)

- Fixed Timestamps for PreparedStatements
- Fixed null pointer exceptions in RSMD and RS
- Re-compiled with jikes for valid class files (thanks ms!)

Changes in MySQL Connector/J 1.1h (08 March 1999)

- Fixed escape processor to deal with unmatched { and } (thanks to Craig Coles)
- Fixed escape processor to create more portable (between DATETIME and TIMESTAMP types) representations so that it will work with BETWEEN clauses. (thanks to Craig Longman)
- MysqlIO.quit() now closes the socket connection. Before, after many failed connections some OS's would run out of file descriptors. (thanks to Michael Brinkman)
- Fixed NullPointerException in Driver.getPropertyInfo. (thanks to Dave Potts)
- Fixes to MysqlDefs to allow all *text fields to be retrieved as Strings. (thanks to Chris at Leverage)
- Fixed setDouble in PreparedStatement for large numbers to avoid sending scientific notation to the database. (thanks to J.S. Ferguson)
- Fixed getScale() and getPrecision() in RSMD. (contrib'd by James Klicman)
- Fixed getObject() when field was DECIMAL or NUMERIC (thanks to Bert Hobbs)
- DBMD.getTables() bombed when passed a null table-name pattern. Fixed. (thanks to Richard Lobb)
- Added check for "client not authorized" errors during connect. (thanks to Hannes Wallnoefer)

Changes in MySQL Connector/J 1.1g (19 February 1999)

- Result set rows are now byte arrays. Blobs and Unicode work bidirectonally now. The useUnicode and encoding options are implemented now.
- Fixes to PreparedStatement to send binary set by setXXXStream to be sent untouched to the MySQL server.
- Fixes to getDriverPropertyInfo().

Changes in MySQL Connector/J 1.1f (31 December 1998)

- Changed all ResultSet fields to Strings, this should allow Unicode to work, but your JVM must be able to convert between the character sets. This should also make reading data from the server be a bit quicker, because there is now no conversion from StringBuffer to String.
- Changed PreparedStatement.streamToString() to be more efficient (code from Uwe Schaefer).
- URL parsing is more robust (throws SQL exceptions on errors rather than NullPointerExceptions)
- PreparedStatement now can convert Strings to Time/Date values using setObject() (code from Robert Currey).

- IO no longer hangs in Buffer.readInt(), that bug was introduced in 1.1d when changing to all byte-arrays for result sets. (Pointed out by Samo Login)

Changes in MySQL Connector/J 1.1b (03 November 1998)

- Fixes to DatabaseMetaData to allow both IBM VA and J-Builder to work. Let me know how it goes. (thanks to Jac Kersing)
- Fix to ResultSet.getBoolean() for NULL strings (thanks to Barry Lagerweij)
- Beginning of code cleanup, and formatting. Getting ready to branch this off to a parallel JDBC-2.0 source tree.
- Added "final" modifier to critical sections in MysqlIO and Buffer to allow compiler to inline methods for speed.

9-29-98

- If object references passed to setXXX() in PreparedStatement are null, setNull() is automatically called for you. (Thanks for the suggestion goes to Erik Ostrom)
- setObject() in PreparedStatement will now attempt to write a serialized representation of the object to the database for objects of Types.OTHER and objects of unknown type.
- Util now has a static method readObject() which given a ResultSet and a column index will re-instantiate an object serialized in the above manner.

Changes in MySQL Connector/J 1.1 (02 September 1998)

- Got rid of "ugly hack" in MysqlIO.nextRow(). Rather than catch an exception, Buffer.isLastDataPacket() was fixed.
- Connection.getCatalog() and Connection.setCatalog() should work now.
- Statement.setMaxRows() works, as well as setting by property maxRows. Statement.setMaxRows() overrides maxRows set using properties or url parameters.
- Automatic re-connection is available. Because it has to "ping" the database before each query, it is turned off by default. To use it, pass in "autoReconnect=true" in the connection URL. You may also change the number of reconnect tries, and the initial timeout value using "maxReconnects=n" (default 3) and "initialTimeout=n" (seconds, default 2) parameters. The timeout is an exponential backoff type of timeout; for example, if you have initial timeout of 2 seconds, and maxReconnects of 3, then the driver will timeout 2 seconds, 4 seconds, then 16 seconds between each re-connection attempt.

Changes in MySQL Connector/J 1.0 (24 August 1998)

- Fixed handling of blob data in Buffer.java
- Fixed bug with authentication packet being sized too small.
- The JDBC Driver is now under the LGPL

8-14-98

- Fixed Buffer.readLenString() to correctly read data for BLOBS.
- Fixed PreparedStatement.stringToStream to correctly read data for BLOBS.
- Fixed PreparedStatement.setDate() to not add a day. (above fixes thanks to Vincent Partington)
- Added URL parameter parsing (?user=... and so forth).

Changes in MySQL Connector/J 0.9d (04 August 1998)

- Big news! New package name. Tim Endres from ICE Engineering is starting a new source tree for GNU GPL'd Java software. He's graciously given me the org.gjt.mm package directory to use, so now the driver is in the org.gjt.mm.mysql package scheme. I'm "legal" now. Look for more information on Tim's project soon.
- Now using dynamically sized packets to reduce memory usage when sending commands to the DB.
- Small fixes to getTypeInfo() for parameters, and so forth.
- DatabaseMetaData is now fully implemented. Let me know if these drivers work with the various IDEs out there. I've heard that they're working with JBuilder right now.
- Added JavaDoc documentation to the package.
- Package now available in .zip or .tar.gz.

Changes in MySQL Connector/J 0.9 (28 July 1998)

- Implemented getTypeInfo(). Connection.rollback() now throws an SQLException per the JDBC spec.
- Added PreparedStatement that supports all JDBC API methods for PreparedStatement including InputStreams. Please check this out and let me know if anything is broken.
- Fixed a bug in ResultSet that would break some queries that only returned 1 row.
- Fixed bugs in DatabaseMetaData.getTables(), DatabaseMetaData.getColumns() and DatabaseMetaData.getCatalogs().
- Added functionality to Statement that enables executeUpdate() to store values for IDs that are automatically generated for AUTO_INCREMENT fields. Basically, after an executeUpdate(), look at the SQLWarnings for warnings like "LAST_INSERTED_ID = 'some number', COMMAND = 'your SQL query'". If you are using AUTO_INCREMENT fields in your tables and are executing a lot of executeUpdate()s on one Statement, be sure to clearWarnings() every so often to save memory.

Changes in MySQL Connector/J 0.8 (06 July 1998)

- Split MysqlIO and Buffer to separate classes. Some ClassLoaders gave an IllegalAccess error for some fields in those two classes. Now mm.mysql works in applets and all classloaders. Thanks to Joe Ennis <jce@mail.boone.com> for pointing out the problem and working on a fix with me.

Changes in MySQL Connector/J 0.7 (01 July 1998)

- Fixed DatabaseMetadata problems in getColumns() and bug in switch statement in the Field constructor. Thanks to Costin Manolache <costin@tdiinc.com> for pointing these out.

Changes in MySQL Connector/J 0.6 (21 May 1998)

- Incorporated efficiency changes from Richard Swift <Richard.Swift@kanatek.ca> in `MysqlIO.java` and `ResultSet.java`:
- We're now 15% faster than gwe's driver.
- Started working on `DatabaseMetaData`.
- The following methods are implemented:
  - `getTables()`
  - `getTableTypes()`

- `getColumns()`
- `getCatalogs()`

MySQL Connector/C++ Change History

Changes in MySQL Connector/C++ 1.1.x

Changes in MySQL Connector/CPP 1.1.1 (2012-08-07, Generally Available)

This fixes bugs since the 1.1.0 release.

Functionality Added or Changed

- Added `MySQL_Connection::getLastStatementInfo()` which returns back the value of the `mysql_info()` function of the MySQL Client Library (`libmysql`).
- Added new method `ResultSetMetaData::isNumeric()` and implemented it in all classes that subclass from it.
- URI format has been extended to better fit IPv6 addresses. You can now use `[]` to separate the host part of the URI.
- Built against `libmysql` 5.5.27, enabling support of authentification plugins and IPv6.

Bugs Fixed

- Compiling with Visual Studio 2010 could fail with compilation errors if the source contained a `#include <stdint.h>` line. The errors were typically of the form `cannot convert from 'type1' to 'type2'`. (Bug #14113387, Bug #60307)
- `DatabaseMetaData::getSQLKeywords()` updated to match MySQL 5.5. Note that Connector/C++, just like Connector/J, returns the same list for every MySQL database version.
- A statement that did not raise any warning could return warnings from a previously executed statement.
- Fixed `stores(Lower|Mixed)Case(Quoted)Identifiers` methods.

Changes in MySQL Connector/CPP 1.1.0 (2010-09-13, Generally Available)

This fixes bugs since the first GA release 1.0.5 and introduces new features.

Functionality Added or Changed

- **Incompatible Change**: API incompatible change: `ConnectPropertyVal` is no longer a `struct` by a typedef that uses `boost::variant`. Code such as:

```
sql::ConnectPropertyVal tmp;
tmp.str.val=passwd.c_str();
tmp.str.len=passwd.length();
connection_properties["password"] = tmp;
```

  Should be changed to:

```
connection_properties["password"] = sql::ConnectPropertyVal(passwd);
```

- `Connection::getClientOption(const sql::SQLString & optionName, void * optionValue)` now accepts the `optionName` values `metadataUseInfoSchema`, `defaultStatementResultType`, `defaultPreparedStatementResultType`, and `characterSetResults`. In the previous version only `metadataUseInfoSchema` was permitted. The same options are available for `Connection::setClientOption()`.

- `get_driver_instance()` is now only available in dynamic library builds - static builds do not have this symbol. This was done to accommodate loading the DLL with `LoadLibrary` or `dlopen`. If you do not use `CMake` for building the source code you will need to define `mysqlcppconn_EXPORTS` if you are loading dynamically and want to use the `get_driver_instance()` entry point.
- Connection map property `OPT_RECONNECT` was changed to be of type `boolean` from `long long`.
- `LDFLAGS`, `CXXFLAGS` and `CPPFLAGS` are now checked from the environment for every binary generated.
- Instances of `std::auto_ptr` have been changed to `boost::scoped_ptr`. Scoped array instances now use boost::scoped_array. Further, `boost::shared_ptr` and `boost::weak_ptr` are now used for guarding access around result sets.

Bugs Fixed

- Certain header files were incorrectly present in the source distribution. The fix excludes dynamically generated and platform specific header files from source packages generated using CPack. (Bug #45846)
- `CMake` generated an error if configuring an out of source build, that is, when `CMake` was not called from the source root directory. (Bug #45843)
- Using Prepared Statements caused corruption of the heap. (Bug #45048)
- Missing includes when using GCC 4.4. Note that GCC 4.4 is not yet in use for any official MySQL Connector/C++ builds. (Bug #44931)
- A bug was fixed in Prepared Statements. The bug occurred when a stored procedure was prepared without any parameters. This led to an exception. (Bug #44931)
- Fixed bug in `ResultSetMetaData` for statements and prepared statements, `getScale` and `getPrecision` returned incorrect results.
- Fixed a Prepared Statements performance issue. Reading large result sets was slow.

Changes in MySQL Connector/C++ 1.0.x

Changes in MySQL Connector/CPP 1.0.5 (2009-04-21)

This is the first Generally Available (GA) release.

Functionality Added or Changed

- Added better support for named pipes, on Windows. Use `pipe://` and add the path to the pipe. Shared memory connections are currently not supported.
- Enabled tracing functionality when building with Microsoft Visual C++ 8 and later, which corresponds to Microsoft Visual Studio 2005 and later.
- Added `Result::getType()`. Implemented for the three result set classes.
- Added the option `defaultStatementResultType` to `MySQL_Connection::setClientOption()`. Also, the method now returns `sql::Connection *`.
- Implemented `getResultSetType()` for `PreparedStatement`. The setter is not implemented because currently `PreparedStatement` cannot do refetching. Storing the result means the bind buffers will be correct.
- Implemented `getResultSetType()` and `setResultSetType()` for `Statement`. Uses `TYPE_FORWARD_ONLY`, which means unbuffered result set and `TYPE_SCROLL_INSENSITIVE`, which means buffered result set.

- Changed the return type of `sql::SQLException::getSQLState()` from `std::string` to `const char *` to be consistent with `std::exception::what()`.
- Changed the interface of `sql::Driver` and `sql::Connection` so they accept the options map by alias instead of by value.
- Improved memory management. Potential memory leak situations are handled more robustly.
- The interface of `sql::ConnectionMetaData`, `sql::ResultSetMetaData` and `sql::ParameterMetaData` was modified to have a protected destructor. As a result the client code has no need to destruct the metadata objects returned by the connector. MySQL Connector/C++ handles the required destruction. This enables statements such as:

  ```
  connection->getMetaData->getSchema();
  ```

  This avoids potential memory leaks that could occur as a result of losing the pointer returned by `getMetaData()`.

Bugs Fixed

- A bug was fixed in `MySQL_Connection::setSessionVariable()`, which had been causing exceptions to be thrown.

Changes in MySQL Connector/CPP 1.0.4 (2009-03-31, beta)

Functionality Added or Changed

- Introduced `ResultSetMetaData::isZerofill()`, which is not in the JDBC specification.
- Added support for MySQL Connector/C.
- Implemented `MySQL_ConnectionMetaData::supportsConvert(from, to)`.
- `metadataUseInfoSchema` was added to the connection property map, which enables control of the `INFORMATION_SCHEMA` for metadata.
- Minimum `CMake` version required was changed from 2.4.2 to 2.6.2. The latest version is required for building on Windows.
- An installer was added for the Windows operating system.

Bugs Fixed

- A leak was fixed in `MySQL_PreparedResultSet`, which occurred when the result contained a `BLOB` column.
- A bug was fixed in all implementations of `ResultSet::relative()` which was giving a wrong return value although positioning was working correctly.

Changes in MySQL Connector/CPP 1.0.3 (2009-03-02, alpha)

Functionality Added or Changed

- Implemented `MySQL_DatabaseMetaData::getCrossReference()`.
- Implemented `MySQL_DatabaseMetaData::getExportedKeys()`.
- Improved the implementation for `ResultSetMetaData::isReadOnly()`. Values generated from views are read only. These generated values don't have `db` in `MYSQL_FIELD` set, while all normal columns do have.
- Introduced `ResultSet::getUInt()` and `ResultSet::getUInt64()`.

- Renamed `ResultSet::getLong()` to `ResultSet::getInt64()`. `resultset.h` includes typdefs for Windows to be able to use `int64_t`.
- Introduced, internally, `sql::mysql::MyVal` which has implicit constructors. Used in `mysql_metadata.cpp` to create result sets with native data instead of always string (varchar).
- Changed the implementation of `MySQL_ConstructedResultSet` to use the more efficient O(1) access method. This should improve the speed with which the metadata result sets are used. Also, there is less copying during the construction of the result set, which means that all result sets returned from the metadata functions will be faster.
- Re-added `getTypeInfo()` with information about all types supported by MySQL and the `sql::DataType`.
- `make package_source` now packs with bzip2.
- Implemented `MySQL_ConnectionMetaData::getProcedureColumns()`.
- Implementation for `MySQL_DatabaseMetaData::getImportedKeys()` for MySQL versions before 5.1.16 using `SHOW`, and above using `INFORMATION_SCHEMA`.
- `cppconn/datatype.h` has changed and is now used again. Reimplemented the type subsystem to be more usable - more types for binary and nonbinary strings.
- Implemented `MySQL_DatabaseMetaData::getColumnPrivileges()`.
- Implemented `MySQL_Connection::setSessionVariable()` for setting variables like `sql_mode`.
- Fixed `MySQL_DatabaseMetaData::getTablePrivileges()`. Test cases were added in the first unit testing framework.
- Implemented `ResultSet::getBlob()` which returns `std::stream`.
- New `BLOB` implementation. `sql::Blob` was removed in favor of `std::istream`. C++'s `IOStream` library is very powerful, similar to PHP's streams. It makes no sense to reinvent the wheel. For example, you can pass a `std::istringstream` object to `setBlob()` if the data is in memory, or just open a file `std::fstream` and let it stream to the DB, or write its own stream. This is also true for `getBlob()` where you can just copy data (if a buffered result set), or stream data (if implemented).
- Added properties enabled methods for connecting, which add many connect options. This uses a dictionary (map) of key value pairs. Methods added are `Driver::connect(map)`, and `Connection::Connection(map)`.
- Experimental support for STLPort. This feature may be removed again at any time later without prior warning! Type `cmake -L` for configuration instructions.
- Addition of `test/unit/README` with instructions for writing bug and regression tests.
- Major performance improvements due to new buffered `ResultSet` implementation.
- `MySQL_Driver::getPatchVersion` introduced.
- New data types added to the list returned by `DatabaseMetaData::getTypeInfo()` are `FLOAT UNSIGNED`, `DECIMAL UNSIGNED`, `DOUBLE UNSIGNED`. Those tests may not be in the JDBC specification. However, due to the change you should be able to look up every type and type name returned by, for example, `ResultSetMetaData::getColumnTypeName()`.
- Added new tests in `test/unit/classes`. Those tests are mostly about code coverage. Most of the actual functionality of the driver is tested by the tests found in `test/CJUnitPort`.

Bugs Fixed

- Fixed handling of numeric columns in `ResultSetMetaData::isCaseSensitive` to return `false`.
- Corrected handling of unsigned server types. Now returning correct values.
- Bug fixed in `MySQL_PreparedResultSet::getString()`. Returned string that had real data but the length was random. Now, the string is initialized with the correct length and thus is binary safe.

Changes in MySQL Connector/CPP 1.0.2 (2008-12-19, alpha)

Functionality Added or Changed

- Added `test/unit` as a basis for general unit tests using the new test framework, see `test/unit/example` for basic usage examples.
- Added new unit test framework for JDBC compliance and regression testing.
- Implemented `MySQL_ResultSetMetaData::getPrecision()` and `MySQL_Prepared_ResultSetMetaData::getPrecision()`, updating example.
- Added PHP script `examples/cpp_trace_analyzer.php` to filter the output of the debug trace. Please see the inline comments for documentation. This script is unsupported.
- Implemented `MySQL_PreparedStatement::clearParameters()`.
- Implemented `MySQL_PreparedStatement::setNull()`.
- Reverted implementation of `MySQL_DatabaseMetaData::getTypeInfo()`. Now unimplemented. In addition, removed `cppconn/datatype.h` for now, until a more robust implementation of the types can be developed.
- `DATE`, `DATETIME` and `TIME` are now being handled when calling the `MySQL_PreparedResultSet` methods `getString()`, `getDouble()`, `getInt()`, `getLong()`, `getBoolean()`.
- Changed `ResultSetMetaData` methods `getColumnDisplaySize()`, `getPrecision()`, `getScale()` to return `unsigned int` instead of `signed int`.
- Implemented `getScale()`, `getPrecision()` and `getColumnDisplaySize()` for `MySQL_ResultSetMetaData` and `MySQL_Prepared_ResultSetMetaData`.

Bugs Fixed

- Fixed `MySQL_PreparedStatement::setBlob()`. In the tests there is a simple example of a class implementing `sql::Blob`.
- Fixed bug in `FLOAT` handling.
- Fixed a bug in `getString()`. `getString()` is now binary safe. A new example was also added.
- Fixed bugs in the `MySQL_PreparedStatements` methods `setBigInt()` and `setDatetime()`. They decremented the internal column index before forwarding the request. This resulted in a double-decrement and therefore the wrong internal column index. The error message generated was:

```
setString() ... invalid "parameterIndex"
```

- Fixed bugs in `MySQL_DatabaseMetaData`. All `supportsCatalogXXXXX` methods were incorrectly returning `true` and all `supportsSchemaXXXX` methods were incorrectly returning `false`. Now `supportsCatalogXXXXX` returns `false` and `supportsSchemaXXXXX` returns `true`.
- Fixed a bug in `MySQL_ConnectionMetaData::getColumns()` which was performing a cartesian product of the columns in the table times the columns matching `columnNamePattern`. The example `example/connection_meta_schemaobj.cpp` was extended to cover the function.

- Fixed bug in `MySQL_ConnectionMetaData::getIndexInfo()`. The method did not work because the schema name wasn't included in the query sent to the server.
- Fixed `MySQL_PreparedStatementResultSet::getDouble()` to return the correct value when the underlying type is `MYSQL_TYPE_FLOAT`.

Changes in MySQL Connector/CPP 1.0.1 (2008-12-01, alpha)

Functionality Added or Changed

- New directory layout.
- MySQL Workbench 5.1 changed to use MySQL Connector/C++ for its database connectivity.
- Converted Connector/J tests added.
- Changed `sql::DbcException` to implement the interface of JDBC's `SQLException`. Renamed to `sql::SQLException`.
- Renamed `sql::DbcInvalidArgument` to `sql::InvalidArgumentException`
- Renamed `sql::DbcMethodNotImplemented` to `sql::MethodNotImplementedException`
- All tests changed to create TAP compliant output.
- Introduced experimental CPack support, see make help.
- Changed metadata column name `TABLE_CATALOG` to `TABLE_CAT` and `TABLE_SCHEMA` to `TABLE_SCHEM` to ensure JDBC compliance.
- Renamed `ConnectionMetaData::getImportedKeys(): PKTABLE_CATALOG` to `PKTABLE_CAT`, `PKTABLE_SCHEMA` to `PKTABLE_SCHEM`, `FKTABLE_CATALOG` to `FKTABLE_CAT`, `FKTABLE_SCHEMA` to `FKTABLE_SCHEM`.
- Renamed `ConnectionMetaData::getPrimaryKeys(): COLUMN` to `COLUMN_NAME`, `SEQUENCE` to `KEY_SEQ`, and `INDEX_NAME` to `PK_NAME`.
- Renamed `ConnectionMetaData::getProcedures: PROCEDURE_SCHEMA` to `PROCEDURE_SCHEM`.
- Renamed `ConnectionMetaData::getTables: TABLE_COMMENT` to `REMARKS`.
- All examples can be given optional connection parameters on the command line, for example:

  ```
  examples/connect tcp://host:port user pass database
  ```

  or

  ```
  examples/connect unix:///path/to/mysql.sock user pass database
  ```

- Added experimental GCov support, `cmake -DMYSQLCPPCONN_GCOV_ENABLE:BOOL=1`
- `ConnectionMetaData::getCatalogTerm()` returns not applicable, there is no counterpart to catalog in MySQL Connector/C++.
- Added `ConnectionMetaData::getSchemas()` and `Connection::setSchema()`.
- Driver Manager was removed.
- Support for (n)make install was added. You can change the default installation path. Carefully read the messages displayed after executing cmake. The following are installed:
  - Static and the dynamic version of the library, `libmysqlcppconn`.
  - Generic interface, `cppconn`.

- Two MySQL specific headers:

  `mysql_driver.h`, use this if you want to get your connections from the driver instead of instantiating a `MySQL_Connection` object. This makes your code portable when using the common interface.

  `mysql_connection.h`, use this if you intend to link directly to the `MySQL_Connection` class and use its specifics not found in `sql::Connection`.

  However, you can make your application fully abstract by using the generic interface rather than these two headers.

- `sql::mysql::MySQL_SQLException` was removed. The distinction between server and client (connector) errors, based on the type of the exception, has been removed. However, the error code can still be checked to evaluate the error type.

MySQL Proxy Change History

Changes in MySQL Proxy 0.8.3 (2012-08-20)

Functionality Added or Changed

- Added timeouts for connect, read, and write operations through `--proxy-connect-timeout`, `--proxy-read-timeout`, and `--proxy-write-timeout` options.
- Added support for making connections to backends and clients using IPv6 addresses.
- Added initial support for the Windows authentication plugin.
- Added support for extracting pluggable authentication protocol information. In the Lua API, added these values: `con.client.challenge.auth_plugin_name`, `con.client.response.auth_plugin_name`.

Bugs Fixed

- Fixed handling of capability flags in the client authentication response. In the C API, `network_mysqld_auth_response_new()` needs the server-side capabilities. In the Lua API, added these values: `con.client.challenge` (mirrors `con.server.challenge`), `con.client.response.server_capabilties`, `con.server.challenge.server_capabilities`.
- Fixed the length of `auth-plugin-data` in the client authentication response packet.
- Fixed crash if the `configfile` value contained invalid characters. In the C API, added `chassis_keyfile_to_options_with_error()` and deprecated `chassis_keyfile_to_options()`.
- Fixed a crash if the `--max-open-files` value was invalid on Win32.
- Fixed the default `plugin_dir` value for 64-bit Unix systems (`lib64/` versus `lib/`).
- Fixed a crash if `COM_BINLOG_DUMP` was used with `rw-splitting.lua`.
- Fixed handling of a missing trailing `\0` in MySQL 5.5.7 through MySQL 5.5.10 in the auth-method name.
- Fixed `abort()` in `COM_CHANGE_USER+auth-method-switch`.
- Fixed excessive buffering of `LOAD DATA LOCAL INFILE` data.
- Fixed a lockup under very high load.

Changes in MySQL Proxy 0.8.2 (2011-08-18)

MySQL Proxy 0.8.2 is a maintenance release and focuses on these areas:

- Adding the protocol changes of MySQL 5.5 and later
- Removing the “admin” plugin from the list of default plugins, as it requires configuration since 0.8.1

Note to Windows Users

- The Microsoft Visual C++ runtime libraries are now a requirement for running MySQL Proxy. Users that do not have these libraries must download and install the Microsoft Visual C++ 2008 Service Pack 1 Redistributable Package MFC Security Update. For the current Proxy version, use the following link to obtain the package:

  ```
  http://www.microsoft.com/download/en/details.aspx?id=26368
  ```

  (Bug #12836100)

Functionality Added or Changed

- Added support for binary log checksums.
- Added support for decoding *all* data types of the row-based replication protocol.
- Added support for `OUT` parameters in prepared statements in stored procedures with MySQL 5.5.
- Removed the “admin” plugin from the list of default plugins, as it requires configuration since 0.8.1.

Bugs Fixed

- Fixed handling of stored procedures with cursors with MySQL 5.5. (Bug #61998)
- A crash occurred if the file named with the `--defaults-file` option did not exist. (Bug #59790)
- The first characters of log messages were stripped. (Bug #59790)
- A memory leak occurred if connection pooling was used. (Bug #56620)
- Fixed handling of “used columns” with row-based replication.
- A crash could occur if run under Valgrind.
- A bogus timestamp log was produced if state tracking was not compiled in.

Changes in MySQL Proxy 0.8.1 (2010-09-13)

Functionality Added or Changed

- `con->in_load_data_local` has been removed.
- Shutdown hooks were added to free the global memory of third-party libraries such as `openssl`.
- `chassis_set_fdlimit()` has been deprecated in favor of `chassis_fdlimit_set()`.
- The unused `network_mysqld_com_query_result_track_state()` function has been deprecated.
- Allow interception of `LOAD DATA INFILE` and `SHOW ERRORS` statements.

Bugs Fixed

- The admin plugin had an undocumented default value for `--admin-password` [1567]. (Bug #53429)

- `network_address_set_address()->network_address_set_address_ip()` called `gethostbyname()` which was not reentrant. This meant that a MySQL Proxy plugin needed to guard all calls to `network_address_set_address()` with a mutex. `network_address_set_address()` has been modified to be thread safe. (Bug #49099)
- If the backend MySQL server went down, and then the clock on the MySQL Proxy host went backward (for example, during daylight saving time adjustments), Proxy stopped forwarding queries to the backend. (Bug #50806)
- The hard limit was fixed for the case where the fdlimit was set. (Bug #48120)
- MySQL Proxy returned an error message with a nonstandard SQL State when all backends were down:

  ```
  "#07000(proxy) all backends are down"
  ```

  This caused issues for clients with “retry” logic, as they could not handle these “custom” SQL States. (Bug #45417)
- Use of `LOAD DATA LOCAL INFILE` caused the connection between the client and MySQL Proxy to abort. (Bug #51864)
- The `--proxy-read-only-backend-addresses` [1571] option did not work. (Bug #38341, Bug #11749171)
- If MySQL Proxy used a UNIX socket, it did not remove the socket file at termination time. (Bug #38415)
- When running `configure` to build, the error message relating to the `lua` libraries could be misleading. The wording and build advice have been updated.

Changes in MySQL Proxy 0.8.0 (2010-01-21)

Functionality Added or Changed

- The `--no-daemon` has been renamed to The `--daemon` [1568]. By default, MySQL Proxy now starts in foreground mode. Use the `--daemon` [1568] option to override this and start in daemon mode.

Bugs Fixed

- MySQL Proxy would load a configuration file with unsafe permissions, which could permit password information to be exposed through the file. MySQL Proxy now refuses to load a configuration file with unsafe permissions. (Bug #47589)
- A memory leak occurred in MySQL Proxy if clients older than MySQL 4.1 connected to it. (Bug #50993)
- A segmentation fault occurred in MySQL Proxy if clients older than MySQL 4.1 connected to it. (Bug #48641)
- Several supplied scripts were updated to account for flag and structure changes:
  - `active-transactions.lua` was updated to use the `resultset_is_needed` flag.
  - `ro-balance.lua` was updated to use the `resultset_is_needed` flag and updated `proxy.connection.dst.name` structure.
  - `rw-splitting.lua` was updated to use the `resultset_is_needed` flag and updated `proxy.connections` structure.

  (Bug #47349, Bug #45408, Bug #47345, Bug #43424, Bug #42841, Bug #46141)

- MySQL Proxy accepted more than one address in the value of the `--proxy-backend-addresses` [1571] option. You should specify one `--proxy-backend-addresses` [1571] option for each backend address. (Bug #47273)
- MySQL Proxy returned the wrong version string internally from the `proxy.PROXY_VERSION` constant. (Bug #45996)
- MySQL Proxy failed to work with certain versions of MySQL, including MySQL 5.1.15, where a change in the MySQL protocol existed. Now Proxy denies `COM_CHANGE_USER` commands when it is connected to MySQL 5.1.14 to 5.1.17 servers by sending back an error: `COM_CHANGE_USER is broken on 5.1.14-.17, please upgrade the MySQL Server`. (Bug #45167)

  References: See also Bug #25371.
- The line numbers provided in stack traces were off by one. (Bug #47348)
- Due to a memory leak, memory usage for each new connection to the proxy increased, leading to very high consumption. (Bug #45272)
- MySQL Proxy could stop accepting network packets if it received a large number of packets. The listen queue has been extended to permit a larger backlog. (Bug #45878, Bug #43278)
- Logging to `syslog` with the `--log-use-syslog` [1569] option did not work. (Bug #36431)
- MySQL Proxy raised an error when processing query packets larger than 16MB. (Bug #35202)
- MySQL Proxy could incorrectly insert `NULL` values into the returned result set, even though non-`NULL` values were returned in the original query. (Bug #35729)

Changes in MySQL Proxy 0.7.2 (2009-06-30)

Bugs Fixed

- On Windows, MySQL Proxy might not find the required modules during initialization. The core code has been updated to find the components correctly, and the Lua-based C modules are prefixed with `lua-` and Lua plugins with `plugin-`. (Bug #45833)

Changes in MySQL Proxy 0.7.1 (2009-05-15)

Bugs Fixed

- Due to a memory leak, memory usage for each new connection to the proxy increased, leading to very high consumption. (Bug #45272)
- When using the `rw-splitting.lua` script, you could get an error when talking to the backend server:

  ```
  2008-07-28 18:00:30: (critical) (read_query) [string
  "/usr/local/share/mysql-proxy/rw-splitting.l..."]:218: bad argument #1 to 'ipairs' (table
  expected, got userdata)
  ```

  This led to Proxy closing the connection to the configured MySQL backend. (Bug #38419)
- MySQL Proxy was unable to increase its own maximum number of open files according to the limit specified by the `--max-open-files` [1570] option, if the limit was less than 8192. When set to debug level, Proxy now reports the open files limit and when the limit has been updated. (Bug #42783)
- MySQL Proxy crashed when connecting to a MySQL 4.0 server. Now it generates an error message instead. (Bug #38601)
- Result sets with more than 250 fields could cause MySQL Proxy to crash. (Bug #43078)

- The port number was reported incorrectly in `proxy.connection.client.address`. (Bug #43313)
- When using MySQL Proxy with multiple backends, failure of one backend caused Proxy to disconnect all backends and stop routing requests. (Bug #34793)

Changes in MySQL Proxy 0.7.0 (Not Released)

Functionality Added or Changed

- A number of the internal structures developed for use with Lua scripts that work with MySQL Proxy have been updated and harmonized to make their meaning and contents easier to use and consistent across multiple locations.
  - The address information has been updated. Instead of a combined `ip:port` structure that you had to parse to extract the individual information, you can now access that information directly. For example, instead of structures providing a single `.address` item, you now have these items: `name` (the combined `ip:port`), `address` (the IP address), and `port` (port number). In addition, all addresses now supply both the `src` (source) and `dst` (destination) socket information for both ends of connections.

    Some familiar structures have been updated to accommodate this information:
    - `proxy.connection.client.address` is `proxy.connection.client.src.name`
    - `proxy.connection.server.address` is `proxy.connection.server.dst.name`
  - `proxy.backends` is now in `proxy.global.backends` The `.address` field of each backend is an address-object as described earlier. For example, `proxy.backends[1].address` is `proxy.global.backends[1].dst.name`.
  - The `read_auth()` and `read_handshake()` functions no longer receive an `auth` parameter. Instead, all the data is available in the connection tables.

    In `read_handshake()`, you access the information through the global `proxy.connection` table:

0.6	0.7
`auth.thread_id`	`proxy.connection.server.thread_id`
`auth.mysqld_version`	`proxy.connection.server.mysqld_version`
`auth.server_addr`	`proxy.connection.server.dst.name`
`auth.client_addr`	`proxy.connection.client.src.name`
`auth.scramble`	`proxy.connection.server.scramble_buffer`

    In `read_auth()`, you can use the following:

0.6	0.7
`auth.username`	`proxy.connection.client.username`
`auth.password`	`proxy.connection.client.scrambled_password`
`auth.default_db`	`proxy.connection.client.default_db`
`auth.server_addr`	`proxy.connection.server.dst.name`
`auth.client_addr`	`proxy.connection.client.src.name`

  - In the `proxy.queries:append()` function, a third parameter is an (optional) table with options specific to the this packet. Specifically, if you want to have access to the result set in the `read_query_result()` hook, you must set the `resultset_is_needed` flag:

```
proxy.queries:append( 1, ..., { resultset_is_needed = true } )
```

For more information, see proxy.queries [1579].

- `proxy.backends` is now in `proxy.global.backends`.

Changes in MySQL Proxy 0.6.1 (2008-02-06)

Functionality Added or Changed

- Added new features to `run-tests.lua`.
- Fixed error handling for socket functions on Windows.
- Fixed sending fake server-greetings in `connect_server()`.
- Fixed assertions on write errors.

Changes in MySQL Proxy 0.6.0 (2007-09-11)

Functionality Added or Changed

- When using read/write splitting and the `rw-splitting.lua` example script, connecting a second user to the proxy returns an error message. (Bug #30867)
- Added connection pooling.
- Added a global Lua-scope `proxy.global.*`.
- Added support for listening UNIX sockets.
- Added `--no-proxy` to disable the proxy.
- Added test cases.
- Added support for `proxy.response.packets`.
- Added handling of `proxy.connection.backend_ndx` in `connect_server()` and `read_query()` to support read/write splitting.
- Added hooks for `read_auth()`, `read_handshake()` and `read_auth_result()`.
- By default, MySQL Proxy now starts in daemon mode. Use the new `--no-daemon` option to override this. Added the `--pid-file` [1573] option for writing the process ID to a file after becoming a daemon.
- Added support in `read_query_result()` to overwrite the result set.

Bugs Fixed

- Fixed an assertion that MySQL Proxy raised at login time if a client specified no password and no default database. (Bug #29719)
- Fixed an assertion on result-packets like `[field-len | fields | EOF | ERR]`. (Bug #29732)
- Fixed an assertion on `COM_BINLOG_DUMP`. (Bug #29764)
- Fixed an assertion at `COM_SHUTDOWN`. (Bug #29719)
- Fixed a memory leak when `proxy.response.*` is used.
- Fixed handling of (SQL) `NULL` in result sets.

- Fixed `inj.resultset.affected_rows` on `SELECT` queries.
- Fixed decoding of length-encoded ints for 3-byte notation.
- Fixed an assertion when connecting to MySQL 6.0.1.
- Fixed compilation on win32.
- Fixed length encoding on `proxy.resultsets`.
- Fixed connection stalling if `read_query_result()` raised an assertion.
- Fixed an assertion at connect time when all backends are down.
- Fixed the `glib2` check to require at least `glib2` 2.6.0.
- Fixed a crash if `proxy.connection` is used in `connect_server()`.

Changes in MySQL Proxy 0.5.1 (2007-06-30)

Functionality Added or Changed

- Added protection against duplicate result sets from a script.
- Added support for UNIX sockets.
- Added `proxy.VERSION`.
- Added script examples for rewriting and injection.
- Added support for pre-4.1 passwords in a 4.1 connection.
- Added `inj.query_time` and `inj.response_time` into the Lua scripts.
- Added missing dependency to `libmysqlclient-dev` to the `INSTALL` file.
- Changed `--proxy.profiling` to `--proxy-skip-profiling` [1572].
- Added `resultset.affected_rows` and `resultset.insert_id`.

Bugs Fixed

- Fixed an assertion when `read_query_result()` is not provided when `PROXY_SEND_QUERY` is used.
- Fixed an assertion when an error occurs at initial script exec time.
- Fixed a warning if `connect_server()` is not provided.
- Fixed a crash on fields longer than 250 bytes when the result set is inspected.
- Fixed a compile error with MySQL 4.1.x on missing `COM_STMT_*`.
- Fixed handling of duplicate ERR on `COM_CHANGE_USER` in MySQL 5.1.18+.
- Fixed mysql check in `configure` to die when `mysql.h` isn't detected.

Changes in MySQL Proxy 0.5.0 (2007-06-19)

This is the first beta release.

Bugs Fixed

- Added `CMake` support.

- Added `automake`/`autoconf` support.

Appendix E. Restrictions and Limits

Table of Contents

Restrictions on Stored Programs 4541
Restrictions on Server-Side Cursors 4545
Restrictions on Subqueries 4546
Restrictions on Views 4547
Restrictions on XA Transactions 4549
Restrictions on Character Sets 4550
Limits in MySQL 4550
- Limits of Joins 4550
- Limits on Number of Databases and Tables 4550
- Limits on Table Size 4551
- Table Column-Count and Row-Size Limits 4552
- Windows Platform Limitations 4554

The discussion here describes restrictions that apply to the use of MySQL features such as subqueries or views.

Restrictions on Stored Programs

These restrictions apply to the features described in Chapter 19, *Stored Programs and Views*.

Some of the restrictions noted here apply to all stored routines; that is, both to stored procedures and stored functions. There are also some restrictions specific to stored functions but not to stored procedures.

The restrictions for stored functions also apply to triggers. There are also some restrictions specific to triggers.

The restrictions for stored procedures also apply to the `DO` clause of Event Scheduler event definitions. There are also some restrictions specific to events.

SQL Statements Not Permitted in Stored Routines

Stored routines cannot contain arbitrary SQL statements. The following statements are not permitted:

- The locking statements `LOCK TABLES` and `UNLOCK TABLES`.
- `ALTER VIEW`. (Before MySQL 5.1.21, this restriction is enforced only for stored functions.)
- `LOAD DATA` and `LOAD TABLE`.
- SQL prepared statements (`PREPARE`, `EXECUTE`, `DEALLOCATE PREPARE`) can be used in stored procedures, but not stored functions or triggers. Thus, stored functions and triggers cannot use dynamic SQL (where you construct statements as strings and then execute them).
- Generally, statements not permitted in SQL prepared statements are also not permitted in stored programs. For a list of statements supported as prepared statements, see SQL Syntax for Prepared Statements.
- Inserts cannot be delayed. `INSERT DELAYED` syntax is accepted, but the statement is handled as a normal `INSERT`.
- Within all stored programs (stored procedures and functions, triggers, and events), the parser treats `BEGIN [WORK]` as the beginning of a `BEGIN ... END` block. To begin a transaction in this context, use `START TRANSACTION` instead.

Restrictions for Stored Functions

The following additional statements or operations are not permitted within stored functions. They are permitted within stored procedures, except stored procedures that are invoked from within a stored function or trigger. For example, if you use `FLUSH` in a stored procedure, that stored procedure cannot be called from a stored function or trigger.

- Statements that perform explicit or implicit commit or rollback. Support for these statements is not required by the SQL standard, which states that each DBMS vendor may decide whether to permit them.
- Statements that return a result set. This includes `SELECT` statements that do not have an `INTO *var_list*` clause and other statements such as `SHOW`, `EXPLAIN`, and `CHECK TABLE`. A function can process a result set either with `SELECT ... INTO *var_list*` or by using a cursor and `FETCH` statements. See `SELECT ... INTO` Syntax, and Cursors.
- `FLUSH` statements.
- Stored functions cannot be used recursively.
- A stored function or trigger cannot modify a table that is already being used (for reading or writing) by the statement that invoked the function or trigger.
- If you refer to a temporary table multiple times in a stored function under different aliases, a `Can't reopen table: '*tbl_name*'` error occurs, even if the references occur in different statements within the function.

Restrictions for Triggers

For triggers, the following additional restrictions apply:

- Triggers currently are not activated by foreign key actions.
- When using row-based replication, triggers on the slave are not activated by statements originating on the master. The triggers on the slave are activated when using statement-based replication. For more information, see Replication and Triggers.
- The `RETURN` statement is not permitted in triggers, which cannot return a value. To exit a trigger immediately, use the `LEAVE` statement.
- Triggers are not permitted on tables in the `mysql` database.
- The trigger cache does not detect when metadata of the underlying objects has changed. If a trigger uses a table and the table has changed since the trigger was loaded into the cache, the trigger operates using the outdated metadata.

Restrictions on Calling Stored Procedures

Before MySQL 5.1.4, `CALL` statements cannot be prepared, meaning that stored procedures cannot be called from dynamic SQL. This is true both for server-side prepared statements and for SQL prepared statements.

Name Conflicts within Stored Routines

The same identifier might be used for a routine parameter, a local variable, and a table column. Also, the same local variable name can be used in nested blocks. For example:

```
CREATE PROCEDURE p (i INT)
BEGIN
```

```
  DECLARE i INT DEFAULT 0;
  SELECT i FROM t;
  BEGIN
    DECLARE i INT DEFAULT 1;
    SELECT i FROM t;
  END;
END;
```

In such cases, the identifier is ambiguous and the following precedence rules apply:

- A local variable takes precedence over a routine parameter or table column.
- A routine parameter takes precedence over a table column.
- A local variable in an inner block takes precedence over a local variable in an outer block.

The behavior that variables take precedence over table columns is nonstandard.

Replication Considerations

Use of stored routines can cause replication problems. This issue is discussed further in Binary Logging of Stored Programs.

The `--replicate-wild-do-table=db_name.tbl_name` [1637] option applies to tables, views, and triggers. It does not apply to stored procedures and functions, or events. To filter statements operating on the latter objects, use one or more of the `--replicate-*-db` options.

Introspection Considerations

`INFORMATION_SCHEMA` does not have a `PARAMETERS` table until MySQL 5.5; this table enables stored routines or client applications to determine the names, types, and default values of parameters for stored routines. For releases without this `INFORMATION_SCHEMA.PARAMETERS` table, to examine these types of metadata, you must use workarounds such as parsing the output of `SHOW CREATE` statements or the `param_list` column of the `mysql.proc` table. `param_list` contents can be processed from within a stored routine, unlike the output from `SHOW`.

Debugging Considerations

There are no stored routine debugging facilities.

Unsupported Syntax from the SQL:2003 Standard

The MySQL stored routine syntax is based on the SQL:2003 standard. The following items from that standard are not currently supported:

- `UNDO` handlers
- `FOR` loops

Concurrency Considerations

To prevent problems of interaction between sessions, when a client issues a statement, the server uses a snapshot of routines and triggers available for execution of the statement. That is, the server calculates a list of procedures, functions, and triggers that may be used during execution of the statement, loads them, and then proceeds to execute the statement. While the statement executes, it does not see changes to routines performed by other sessions.

For maximum concurrency, stored functions should minimize their side-effects; in particular, updating a table within a stored function can reduce concurrent operations on that table. A stored function

acquires table locks before executing, to avoid inconsistency in the binary log due to mismatch of the order in which statements execute and when they appear in the log. When statement-based binary logging is used, statements that invoke a function are recorded rather than the statements executed within the function. Consequently, stored functions that update the same underlying tables do not execute in parallel. In contrast, stored procedures do not acquire table-level locks. All statements executed within stored procedures are written to the binary log, even for statement-based binary logging. See Binary Logging of Stored Programs.

Event Scheduler Restrictions

The following limitations are specific to the Event Scheduler:

- In MySQL 5.1.6 only, any table referenced in an event's action statement must be fully qualified with the name of the schema in which it occurs (that is, as *`schema_name.table_name`*).
- Beginning with MySQL 5.1.8, event names are handled in case-insensitive fashion. For example, this means that you cannot have two events in the same database (and—prior to MySQL 5.1.12—with the same definer) with the names `anEvent` and `AnEvent`.

Important

If you have events created in MySQL 5.1.7 or earlier which are assigned to the same database and have the same definer, and whose names differ only with respect to lettercase, then you must rename these events to respect case-sensitive handling before upgrading to MySQL 5.1.8 or later.

- An event may not be created, altered, or dropped by a stored routine, trigger, or another event. An event also may not create, alter, or drop stored routines or triggers. (Bug #16409, Bug #18896)
- Event timings using the intervals `YEAR`, `QUARTER`, `MONTH`, and `YEAR_MONTH` are resolved in months; those using any other interval are resolved in seconds. There is no way to cause events scheduled to occur at the same second to execute in a given order. In addition—due to rounding, the nature of threaded applications, and the fact that a nonzero length of time is required to create events and to signal their execution—events may be delayed by as much as 1 or 2 seconds. However, the time shown in the `INFORMATION_SCHEMA.EVENTS` table's `LAST_EXECUTED` column or the `mysql.event` table's `last_executed` column is always accurate to within one second of the actual event execution time. (See also Bug #16522.)
- Each execution of the statements contained in the body of an event takes place in a new connection; thus, these statements has no effect in a given user session on the server's statement counts such as `Com_select` and `Com_insert` that are displayed by `SHOW STATUS`. However, such counts *are* updated in the global scope. (Bug #16422)
- Prior to MySQL 5.1.12, you could not view another user's events in the `INFORMATION_SCHEMA.EVENTS` table. In other words, any query made against this table was treated as though it contained the condition `DEFINER = CURRENT_USER()` in the `WHERE` clause.
- Events do not support times later than the end of the Unix Epoch; this is approximately the beginning of the year 2038. Prior to MySQL 5.1.8, handling in scheduled events of dates later than this was buggy; starting with MySQL 5.1.8, such dates are specifically not permitted by the Event Scheduler. (Bug #16396)
- In MySQL 5.1.6, `INFORMATION_SCHEMA.EVENTS` shows `NULL` in the `SQL_MODE` column. Beginning with MySQL 5.1.7, the `SQL_MODE` displayed is that in effect when the event was created.
- In MySQL 5.1.6, the only way to drop or alter an event created by a user who was not the definer of that event was by manipulation of the `mysql.event` system table by the MySQL `root` user or by another user with privileges on this table. Beginning with MySQL 5.1.7, `DROP USER` drops all events for which that user was the definer; also beginning with MySQL 5.1.7 `DROP SCHEMA` drops all events associated with the dropped schema.

- References to stored functions, user-defined functions, and tables in the `ON SCHEDULE` clauses of `CREATE EVENT` and `ALTER EVENT` statements are not supported. Beginning with MySQL 5.1.13, these sorts of references are not permitted. (See Bug #22830 for more information.)
- Generally speaking, statements that are not permitted in stored routines or in SQL prepared statements are also not permitted in the body of an event. For more information, see SQL Syntax for Prepared Statements.
- When upgrading to MySQL 5.1.18 or 5.1.19 from a previous MySQL version where scheduled events were in use, the upgrade utilities `mysql_upgrade` and `mysql_fix_privilege_tables` do not accommodate changes in system tables relating to the Event Scheduler. This issue was fixed in MySQL 5.1.20 (see Bug #28521).

Stored routines and triggers in MySQL Cluster. Stored procedures, stored functions, and triggers are all supported by tables using the `NDB` storage engine; however, it is important to keep in mind that they do *not* propagate automatically between MySQL Servers acting as Cluster SQL nodes. This is because of the following:

- Stored routine definitions are kept in tables in the `mysql` system database using the `MyISAM` storage engine, and so do not participate in clustering.
- The `.TRN` and `.TRG` files containing trigger definitions are not read by the `NDB` storage engine, and are not copied between Cluster nodes.

Any stored routine or trigger that interacts with MySQL Cluster tables must be re-created by running the appropriate `CREATE PROCEDURE`, `CREATE FUNCTION`, or `CREATE TRIGGER` statements on each MySQL Server that participates in the cluster where you wish to use the stored routine or trigger. Similarly, any changes to existing stored routines or triggers must be carried out explicitly on all Cluster SQL nodes, using the appropriate `ALTER` or `DROP` statements on each MySQL Server accessing the cluster.

Warning

Do *not* attempt to work around the issue described in the first item mentioned previously by converting any `mysql` database tables to use the `NDB` storage engine. *Altering the system tables in the `mysql` database is not supported* and is very likely to produce undesirable results.

Restrictions on Server-Side Cursors

Server-side cursors are implemented in the C API using the `mysql_stmt_attr_set()` function. The same implementation is used for cursors in stored routines. A server-side cursor enables a result set to be generated on the server side, but not transferred to the client except for those rows that the client requests. For example, if a client executes a query but is only interested in the first row, the remaining rows are not transferred.

In MySQL, a server-side cursor is materialized into an internal temporary table. Initially, this is a `MEMORY` table, but is converted to a `MyISAM` table when its size exceeds the minimum value of the `max_heap_table_size` [495] and `tmp_table_size` [534] system variables. Note that the same restrictions apply to internal temporary tables created to hold the result set for a cursor as for other uses of internal temporary tables. See How MySQL Uses Internal Temporary Tables. One limitation of the implementation is that for a large result set, retrieving its rows through a cursor might be slow.

Cursors are read only; you cannot use a cursor to update rows.

`UPDATE WHERE CURRENT OF` and `DELETE WHERE CURRENT OF` are not implemented, because updatable cursors are not supported.

Cursors are nonholdable (not held open after a commit).

Cursors are asensitive.

Cursors are nonscrollable.

Cursors are not named. The statement handler acts as the cursor ID.

You can have open only a single cursor per prepared statement. If you need several cursors, you must prepare several statements.

You cannot use a cursor for a statement that generates a result set if the statement is not supported in prepared mode. This includes statements such as `CHECK TABLE`, `HANDLER READ`, and `SHOW BINLOG EVENTS`.

Restrictions on Subqueries

- In MySQL 5.1 before 5.1.16, if you compare a `NULL` value to a subquery using `ALL`, `ANY`, or `SOME`, and the subquery returns an empty result, the comparison might evaluate to the nonstandard result of `NULL` rather than to `TRUE` or `FALSE`. As of 5.1.16, the comparison evaluates to `TRUE` or `FALSE` except for subqueries inside `IS NULL`, such as this:

  ```
  SELECT ... WHERE NULL IN (SELECT ...) IS NULL
  ```

  As of 5.1.32, the `IS NULL` limitation is removed and the comparison evaluates to `TRUE` or `FALSE`.

- Subquery optimization for `IN` is not as effective as for the `=` operator or for the `IN(value_list)` [942] operator.

  A typical case for poor `IN` subquery performance is when the subquery returns a small number of rows but the outer query returns a large number of rows to be compared to the subquery result.

  The problem is that, for a statement that uses an `IN` subquery, the optimizer rewrites it as a correlated subquery. Consider the following statement that uses an uncorrelated subquery:

  ```
  SELECT ... FROM t1 WHERE t1.a IN (SELECT b FROM t2);
  ```

  The optimizer rewrites the statement to a correlated subquery:

  ```
  SELECT ... FROM t1 WHERE EXISTS (SELECT 1 FROM t2 WHERE t2.b = t1.a);
  ```

  If the inner and outer queries return *M* and *N* rows, respectively, the execution time becomes on the order of O(*M*×*N*), rather than O(*M*+*N*) as it would be for an uncorrelated subquery.

  An implication is that an `IN` subquery can be much slower than a query written using an `IN(value_list)` [942] operator that lists the same values that the subquery would return.

- In general, you cannot modify a table and select from the same table in a subquery. For example, this limitation applies to statements of the following forms:

  ```
  DELETE FROM t WHERE ... (SELECT ... FROM t ...);
  UPDATE t ... WHERE col = (SELECT ... FROM t ...);
  {INSERT|REPLACE} INTO t (SELECT ... FROM t ...);
  ```

  Exception: The preceding prohibition does not apply if you are using a subquery for the modified table in the `FROM` clause. Example:

  ```
  UPDATE t ... WHERE col = (SELECT * FROM (SELECT ... FROM t...) AS _t ...);
  ```

  Here the result from the subquery in the `FROM` clause is stored as a temporary table, so the relevant rows in `t` have already been selected by the time the update to `t` takes place.

- Row comparison operations are only partially supported:

  - For *`expr [NOT] IN subquery`*, *`expr`* can be an *n*-tuple (specified using row constructor syntax) and the subquery can return rows of *n*-tuples. The permitted syntax is therefore more specifically expressed as *`row_constructor [NOT] IN table_subquery`*

  - For *`expr op {ALL|ANY|SOME} subquery`*, *`expr`* must be a scalar value and the subquery must be a column subquery; it cannot return multiple-column rows.

  In other words, for a subquery that returns rows of *n*-tuples, this is supported:

```
(expr_1, ..., expr_n) [NOT] IN table_subquery
```

  But this is not supported:

```
(expr_1, ..., expr_n) op {ALL|ANY|SOME} subquery
```

  The reason for supporting row comparisons for `IN` but not for the others is that `IN` is implemented by rewriting it as a sequence of `=` [939] comparisons and `AND` [944] operations. This approach cannot be used for `ALL`, `ANY`, or `SOME`.

- Prior to MySQL 5.1.12, row constructors were not well optimized; of the following two equivalent expressions, only the second could be optimized:

```
(col1, col2, ...) = (val1, val2, ...)
col1 = val1 AND col2 = val2 AND ...
```

  In MySQL 5.1.12 and later, all row equalities are converted into conjunctions of equalities between row elements, and handled by the optimizer in the same way. (Bug #16081)

- Subqueries in the `FROM` clause cannot be correlated subqueries. They are materialized in whole (evaluated to produce a result set) before evaluating the outer query, so they cannot be evaluated per row of the outer query.

- MySQL does not support `LIMIT` in subqueries for certain subquery operators:

```
mysql> SELECT * FROM t1
    ->   WHERE s1 IN (SELECT s2 FROM t2 ORDER BY s1 LIMIT 1);
ERROR 1235 (42000): This version of MySQL doesn't yet support
 'LIMIT & IN/ALL/ANY/SOME subquery'
```

- The optimizer is more mature for joins than for subqueries, so in many cases a statement that uses a subquery can be executed more efficiently if you rewrite it as a join.

  An exception occurs for the case where an `IN` subquery can be rewritten as a `SELECT DISTINCT` join. Example:

```
SELECT col FROM t1 WHERE id_col IN (SELECT id_col2 FROM t2 WHERE condition);
```

  That statement can be rewritten as follows:

```
SELECT DISTINCT col FROM t1, t2 WHERE t1.id_col = t2.id_col AND condition;
```

  But in this case, the join requires an extra `DISTINCT` operation and is not more efficient than the subquery.

- MySQL permits a subquery to refer to a stored function that has data-modifying side effects such as inserting rows into a table. For example, if `f()` inserts rows, the following query can modify data:

```
SELECT ... WHERE x IN (SELECT f() ...);
```

  This behavior is an extension to the SQL standard. In MySQL, it can produce indeterminate results because `f()` might be executed a different number of times for different executions of a given query depending on how the optimizer chooses to handle it.

  For statement-based or mixed-format replication, one implication of this indeterminism is that such a query can produce different results on the master and its slaves.

Restrictions on Views

View processing is not optimized:

- It is not possible to create an index on a view.
- Indexes can be used for views processed using the merge algorithm. However, a view that is processed with the temptable algorithm is unable to take advantage of indexes on its underlying tables (although indexes can be used during generation of the temporary tables).

Subqueries cannot be used in the `FROM` clause of a view.

There is a general principle that you cannot modify a table and select from the same table in a subquery. See Restrictions on Subqueries.

The same principle also applies if you select from a view that selects from the table, if the view selects from the table in a subquery and the view is evaluated using the merge algorithm. Example:

```
CREATE VIEW v1 AS
SELECT * FROM t2 WHERE EXISTS (SELECT 1 FROM t1 WHERE t1.a = t2.a);

UPDATE t1, v2 SET t1.a = 1 WHERE t1.b = v2.b;
```

If the view is evaluated using a temporary table, you *can* select from the table in the view subquery and still modify that table in the outer query. In this case the view will be stored in a temporary table and thus you are not really selecting from the table in a subquery and modifying it “at the same time.” (This is another reason you might wish to force MySQL to use the temptable algorithm by specifying `ALGORITHM = TEMPTABLE` in the view definition.)

You can use `DROP TABLE` or `ALTER TABLE` to drop or alter a table that is used in a view definition. No warning results from the `DROP` or `ALTER` operation, even though this invalidates the view. Instead, an error occurs later, when the view is used. `CHECK TABLE` can be used to check for views that have been invalidated by `DROP` or `ALTER` operations.

A view definition is “frozen” by certain statements:

- If a statement prepared by `PREPARE` refers to a view, the view definition seen each time the statement is executed later will be the definition of the view at the time it was prepared. This is true even if the view definition is changed after the statement is prepared and before it is executed. Example:

  ```
  CREATE VIEW v AS SELECT RAND();
  PREPARE s FROM 'SELECT * FROM v';
  ALTER VIEW v AS SELECT NOW();
  EXECUTE s;
  ```

  The result returned by the `EXECUTE` statement is a random number, not the current date and time.

- If a statement in a stored routine refers to a view, the view definition seen by the statement are its definition the first time that statement is executed. For example, this means that if the statement is executed in a loop, further iterations of the statement see the same view definition, even if the definition is changed later in the loop. Example:

  ```
  CREATE VIEW v AS SELECT 1;
  delimiter //
  CREATE PROCEDURE p ()
  BEGIN
    DECLARE i INT DEFAULT 0;
    WHILE i < 5 DO
      SELECT * FROM v;
      SET i = i + 1;
      ALTER VIEW v AS SELECT 2;
    END WHILE;
  END;
  //
  delimiter ;
  CALL p();
  ```

When the procedure `p()` is called, the `SELECT` returns 1 each time through the loop, even though the view definition is changed within the loop.

As of MySQL 5.1.21, `ALTER VIEW` is prohibited within stored routines, so this restriction does not apply.

With regard to view updatability, the overall goal for views is that if any view is theoretically updatable, it should be updatable in practice. This includes views that have `UNION` in their definition. Currently, not all views that are theoretically updatable can be updated. The initial view implementation was deliberately written this way to get usable, updatable views into MySQL as quickly as possible. Many theoretically updatable views can be updated now, but limitations still exist:

- Updatable views with subqueries anywhere other than in the `WHERE` clause. Some views that have subqueries in the `SELECT` list may be updatable.
- You cannot use `UPDATE` to update more than one underlying table of a view that is defined as a join.
- You cannot use `DELETE` to update a view that is defined as a join.

There exists a shortcoming with the current implementation of views. If a user is granted the basic privileges necessary to create a view (the `CREATE VIEW` [626] and `SELECT` [627] privileges), that user will be unable to call `SHOW CREATE VIEW` on that object unless the user is also granted the `SHOW VIEW` [628] privilege.

That shortcoming can lead to problems backing up a database with `mysqldump`, which may fail due to insufficient privileges. This problem is described in Bug #22062.

The workaround to the problem is for the administrator to manually grant the `SHOW VIEW` [628] privilege to users who are granted `CREATE VIEW` [626], since MySQL doesn't grant it implicitly when views are created.

Views do not have indexes, so index hints do not apply. Use of index hints when selecting from a view is not permitted.

`SHOW CREATE VIEW` displays view definitions using an `AS` *`alias_name`* clause for each column. If a column is created from an expression, the default alias is the expression text, which can be quite long. As of MySQL 5.1.23, aliases for column names in `CREATE VIEW` statements are checked against the maximum column length of 64 characters (not the maximum alias length of 256 characters). As a result, views created from the output of `SHOW CREATE VIEW` fail if any column alias exceeds 64 characters. This can cause problems in the following circumstances for views with too-long aliases:

- View definitions fail to replicate to newer slaves that enforce the column-length restriction.
- Dump files created with `mysqldump` cannot be loaded into servers that enforce the column-length restriction.

A workaround for either problem is the modify each problematic view definition to use aliases that provide shorter column names. Then the view will replicate properly, and can be dumped and reloaded without causing an error. To modify the definition, drop and create the view again with `DROP VIEW` and `CREATE VIEW`, or replace the definition with `CREATE OR REPLACE VIEW`.

For problems that occur when reloading view definitions in dump files, another workaround is to edit the dump file to modify its `CREATE VIEW` statements. However, this does not change the original view definitions, which may cause problems for subsequent dump operations.

Restrictions on XA Transactions

XA transaction support is limited to the `InnoDB` storage engine.

For “external XA,” a MySQL server acts as a Resource Manager and client programs act as Transaction Managers. For “Internal XA”, storage engines within a MySQL server act as RMs, and

the server itself acts as a TM. Internal XA support is limited by the capabilities of individual storage engines. Internal XA is required for handling XA transactions that involve more than one storage engine. The implementation of internal XA requires that a storage engine support two-phase commit at the table handler level, and currently this is true only for `InnoDB`.

For `XA START`, the `JOIN` and `RESUME` clauses are not supported.

For `XA END`, the `SUSPEND [FOR MIGRATE]` clause is not supported.

The requirement that the *`bqual`* part of the *`xid`* value be different for each XA transaction within a global transaction is a limitation of the current MySQL XA implementation. It is not part of the XA specification.

If an XA transaction has reached the `PREPARED` state and the MySQL server is killed (for example, with `kill -9` on Unix) or shuts down abnormally, the transaction can be continued after the server restarts. However, if the client reconnects and commits the transaction, the transaction will be absent from the binary log even though it has been committed. This means the data and the binary log have gone out of synchrony. An implication is that XA cannot be used safely together with replication.

It is possible that the server will roll back a pending XA transaction, even one that has reached the `PREPARED` state. This happens if a client connection terminates and the server continues to run, or if clients are connected and the server shuts down gracefully. (In the latter case, the server marks each connection to be terminated, and then rolls back the `PREPARED` XA transaction associated with it.) It should be possible to commit or roll back a `PREPARED` XA transaction, but this cannot be done without changes to the binary logging mechanism.

Restrictions on Character Sets

- Identifiers are stored in `mysql` database tables (`user`, `db`, and so forth) using `utf8`, but identifiers can contain only characters in the Basic Multilingual Plane (BMP). Supplementary characters are not permitted in identifiers.
- The `ucs2` character sets has the following restrictions:
  - It cannot be used as a client character set, which means that it does not work for `SET NAMES` or `SET CHARACTER SET`. (See Connection Character Sets and Collations.)
  - It is currently not possible to use `LOAD DATA INFILE` to load data files that use this character set.
  - `FULLTEXT` indexes cannot be created on a column that this character set. However, you can perform `IN BOOLEAN MODE` searches on the column without an index.
  - The use of `ENCRYPT()` [1030] with this character set is not recommended because the underlying system call expects a string terminated by a zero byte.
- The `REGEXP` [963] and `RLIKE` [963] operators work in byte-wise fashion, so they are not multi-byte safe and may produce unexpected results with multi-byte character sets. In addition, these operators compare characters by their byte values and accented characters may not compare as equal even if a given collation treats them as equal.

Limits in MySQL

This section lists current limits in MySQL 5.1.

Limits of Joins

The maximum number of tables that can be referenced in a single join is 61. This also applies to the number of tables that can be referenced in the definition of a view.

Limits on Number of Databases and Tables

MySQL has no limit on the number of databases. The underlying file system may have a limit on the number of directories.

MySQL has no limit on the number of tables. The underlying file system may have a limit on the number of files that represent tables. Individual storage engines may impose engine-specific constraints. `InnoDB` permits up to 4 billion tables.

Limits on Table Size

The effective maximum table size for MySQL databases is usually determined by operating system constraints on file sizes, not by MySQL internal limits. The following table lists some examples of operating system file-size limits. This is only a rough guide and is not intended to be definitive. For the most up-to-date information, be sure to check the documentation specific to your operating system.

Operating System	File-size Limit
Win32 w/ FAT/FAT32	2GB/4GB
Win32 w/ NTFS	2TB (possibly larger)
Linux 2.2-Intel 32-bit	2GB (LFS: 4GB)
Linux 2.4+	(using ext3 file system) 4TB
Solaris 9/10	16TB
MacOS X w/ HFS+	2TB
NetWare w/NSS file system	8TB

Windows users, please note that FAT and VFAT (FAT32) are *not* considered suitable for production use with MySQL. Use NTFS instead.

On Linux 2.2, you can get `MyISAM` tables larger than 2GB in size by using the Large File Support (LFS) patch for the ext2 file system. Most current Linux distributions are based on kernel 2.4 or higher and include all the required LFS patches. On Linux 2.4, patches also exist for ReiserFS to get support for big files (up to 2TB). With JFS and XFS, petabyte and larger files are possible on Linux.

For a detailed overview about LFS in Linux, have a look at Andreas Jaeger's *Large File Support in Linux* page at http://www.suse.de/~aj/linux_lfs.html.

If you do encounter a full-table error, there are several reasons why it might have occurred:

- The disk might be full.
- The `InnoDB` storage engine maintains `InnoDB` tables within a tablespace that can be created from several files. This enables a table to exceed the maximum individual file size. The tablespace can include raw disk partitions, which permits extremely large tables. The maximum tablespace size is 64TB.

  If you are using `InnoDB` tables and run out of room in the `InnoDB` tablespace. In this case, the solution is to extend the `InnoDB` tablespace. See Adding, Removing, or Resizing `InnoDB` Data and Log Files.
- You are using `MyISAM` tables on an operating system that supports files only up to 2GB in size and you have hit this limit for the data file or index file.
- You are using a `MyISAM` table and the space required for the table exceeds what is permitted by the internal pointer size. `MyISAM` permits data and index files to grow up to 256TB by default, but this limit can be changed up to the maximum permissible size of 65,536TB ($256^7 - 1$ bytes).

  If you need a `MyISAM` table that is larger than the default limit and your operating system supports large files, the `CREATE TABLE` statement supports `AVG_ROW_LENGTH` and `MAX_ROWS` options. See `CREATE TABLE` Syntax. The server uses these options to determine how large a table to permit.

If the pointer size is too small for an existing table, you can change the options with `ALTER TABLE` to increase a table's maximum permissible size. See `ALTER TABLE` Syntax.

```
ALTER TABLE tbl_name MAX_ROWS=1000000000 AVG_ROW_LENGTH=nnn;
```

You have to specify `AVG_ROW_LENGTH` only for tables with `BLOB` or `TEXT` columns; in this case, MySQL can't optimize the space required based only on the number of rows.

To change the default size limit for `MyISAM` tables, set the `myisam_data_pointer_size` [501], which sets the number of bytes used for internal row pointers. The value is used to set the pointer size for new tables if you do not specify the `MAX_ROWS` option. The value of `myisam_data_pointer_size` [501] can be from 2 to 7. A value of 4 permits tables up to 4GB; a value of 6 permits tables up to 256TB.

You can check the maximum data and index sizes by using this statement:

```
SHOW TABLE STATUS FROM db_name LIKE 'tbl_name';
```

You also can use `myisamchk -dv /path/to/table-index-file`. See `SHOW` Syntax, or `myisamchk` — MyISAM Table-Maintenance Utility.

Other ways to work around file-size limits for `MyISAM` tables are as follows:

- If your large table is read only, you can use `myisampack` to compress it. `myisampack` usually compresses a table by at least 50%, so you can have, in effect, much bigger tables. `myisampack` also can merge multiple tables into a single table. See `myisampack` — Generate Compressed, Read-Only MyISAM Tables.
- MySQL includes a `MERGE` library that enables you to handle a collection of `MyISAM` tables that have identical structure as a single `MERGE` table. See The `MERGE` Storage Engine.

- You are using the `NDB` storage engine, in which case you need to increase the values for the `DataMemory` and `IndexMemory` configuration parameters in your `config.ini` file. See MySQL Cluster Data Node Configuration Parameters.
- You are using the `MEMORY` (`HEAP`) storage engine; in this case you need to increase the value of the `max_heap_table_size` [495] system variable. See Server System Variables.

Table Column-Count and Row-Size Limits

There is a hard limit of 4096 columns per table, but the effective maximum may be less for a given table. The exact limit depends on several interacting factors.

- Every table (regardless of storage engine) has a maximum row size of 65,535 bytes. Storage engines may place additional constraints on this limit, reducing the effective maximum row size.

  The maximum row size constrains the number (and possibly size) of columns because the total length of all columns cannot exceed this size. For example, `utf8` characters require up to three bytes per character, so for a `CHAR(255) CHARACTER SET utf8` column, the server must allocate 255 × 3 = 765 bytes per value. Consequently, a table cannot contain more than 65,535 / 765 = 85 such columns.

  Storage for variable-length columns includes length bytes, which are assessed against the row size. For example, a `VARCHAR(255) CHARACTER SET utf8` column takes two bytes to store the length of the value, so each value can take up to 767 bytes.

  `BLOB` and `TEXT` columns count from one to four plus eight bytes each toward the row-size limit because their contents are stored separately from the rest of the row.

  Declaring columns `NULL` can reduce the maximum number of columns permitted. For `MyISAM` tables, `NULL` columns require additional space in the row to record whether their values are `NULL`.

Each `NULL` column takes one bit extra, rounded up to the nearest byte. The maximum row length in bytes can be calculated as follows:

```
row length = 1
             + (sum of column lengths)
             + (number of NULL columns + delete_flag + 7)/8
             + (number of variable-length columns)
```

`delete_flag` is 1 for tables with static row format. Static tables use a bit in the row record for a flag that indicates whether the row has been deleted. *`delete_flag`* is 0 for dynamic tables because the flag is stored in the dynamic row header. For information about `MyISAM` table formats, see `MyISAM` Table Storage Formats.

These calculations do not apply for `InnoDB` tables. Storage size is the same for `NULL` and `NOT NULL` columns.

The following statement to create table `t1` succeeds because the columns require 32,765 + 2 bytes and 32,766 + 2 bytes, which falls within the maximum row size of 65,535 bytes:

```
mysql> CREATE TABLE t1
    -> (c1 VARCHAR(32765) NOT NULL, c2 VARCHAR(32766) NOT NULL)
    -> ENGINE = MyISAM CHARACTER SET latin1;
Query OK, 0 rows affected (0.02 sec)
```

The following statement to create table `t2` fails because the columns are `NULL` and `MyISAM` requires additional space that causes the row size to exceed 65,535 bytes:

```
mysql> CREATE TABLE t2
    -> (c1 VARCHAR(32765) NULL, c2 VARCHAR(32766) NULL)
    -> ENGINE = MyISAM CHARACTER SET latin1;
ERROR 1118 (42000): Row size too large. The maximum row size for the
used table type, not counting BLOBs, is 65535. You have to change some
columns to TEXT or BLOBs
```

The following statement to create table `t3` fails because although the column length is within the maximum length of 65,535 bytes, two additional bytes are required to record the length, which causes the row size to exceed 65,535 bytes:

```
mysql> CREATE TABLE t3
    -> (c1 VARCHAR(65535) NOT NULL)
    -> ENGINE = MyISAM CHARACTER SET latin1;
ERROR 1118 (42000): Row size too large. The maximum row size for the
used table type, not counting BLOBs, is 65535. You have to change some
columns to TEXT or BLOBs
```

Reducing the column length to 65,533 or less permits the statement to succeed.

- Each table has an `.frm` file that contains the table definition. The server uses the following expression to check some of the table information stored in the file against an upper limit of 64KB:

```
if (info_length+(ulong) create_fields.elements*FCOMP+288+
    n_length+int_length+com_length > 65535L || int_count > 255)
```

The portion of the information stored in the `.frm` file that is checked against the expression cannot grow beyond the 64KB limit, so if the table definition reaches this size, no more columns can be added.

The relevant factors in the expression are:

- `info_length` is space needed for “screens.” This is related to MySQL's Unireg heritage.
- `create_fields.elements` is the number of columns.
- `FCOMP` is 17.

  - `n_length` is the total length of all column names, including one byte per name as a separator.
  - `int_length` is related to the list of values for `ENUM` and `SET` columns.
  - `com_length` is the total length of column and table comments.

  Thus, using long column names can reduce the maximum number of columns, as can the inclusion of `ENUM` or `SET` columns, or use of column or table comments.

- Individual storage engines might impose additional restrictions that limit table column count. Examples:
  - `InnoDB` permits up to 1000 columns.
  - `InnoDB` restricts row size to something less than half a database page (approximately 8000 bytes), not including `VARBINARY`, `VARCHAR`, `BLOB`, or `TEXT` columns.
  - Different `InnoDB` storage formats (`COMPRESSED`, `REDUNDANT`) use different amounts of page header and trailer data, which affects the amount of storage available for rows.

Windows Platform Limitations

The following limitations apply to use of MySQL on the Windows platform:

- **Number of file descriptors**

  The number of open file descriptors on Windows is limited to a maximum of 2048, which may limit the ability to open a large number of tables simultaneously. This limit is due not to Windows but to C runtime library compatibility functions used to open files on Windows that use the POSIX compatibility layer.

  This limitation will also cause problems if you try to set `open_files_limit` to a value greater than the 2048 file limit.

- **Process memory**

  On Windows 32-bit platforms it is not possible by default to use more than 2GB of RAM within a single process, including MySQL. This is because the physical address limit on Windows 32-bit is 4GB and the default setting within Windows is to split the virtual address space between kernel (2GB) and user/applications (2GB).

  Some versions of Windows have a boot time setting to enable larger applications by reducing the kernel application. Alternatively, to use more than 2GB, use a 64-bit version of Windows.

- **File system aliases**

  When using `MyISAM` tables, you cannot use aliases within Windows link to the data files on another volume and then link back to the main MySQL `datadir` [423] location.

  This facility is often used to move the data and index files to a RAID or other fast solution, while retaining the main `.frm` files in the default data directory configured with the `datadir` [423] option.

- **Limited number of ports**

  Windows systems have about 4,000 ports available for client connections, and after a connection on a port closes, it takes two to four minutes before the port can be reused. In situations where clients connect to and disconnect from the server at a high rate, it is possible for all available ports to be used up before closed ports become available again. If this happens, the MySQL server appears to be unresponsive even though it is running. Note that ports may be used by other applications running on the machine as well, in which case the number of ports available to MySQL is lower.

For more information about this problem, see http://support.microsoft.com/default.aspx?scid=kb;en-us;196271.

- **Concurrent reads**

  MySQL depends on the `pread()` and `pwrite()` system calls to be able to mix `INSERT` and `SELECT`. Currently, we use mutexes to emulate `pread()` and `pwrite()`. We intend to replace the file level interface with a virtual interface in the future so that we can use the `readfile()`/`writefile()` interface to get more speed. The current implementation limits the number of open files that MySQL 5.1 can use to 2,048, which means that you cannot run as many concurrent threads on Windows as on Unix.

  This problem is fixed in MySQL 5.5.

- **Blocking read**

  Before MySQL 5.1.41, MySQL uses a blocking read for each connection. That has the following implications if named-pipe connections are enabled:

  - A connection is not disconnected automatically after eight hours, as happens with the Unix version of MySQL.
  - If a connection hangs, it is not possible to break it without killing MySQL.
  - `mysqladmin kill` does not work on a sleeping connection.
  - `mysqladmin shutdown` cannot abort as long as there are sleeping connections.

- **`DROP DATABASE`**

  You cannot drop a database that is in use by another session.

- **Case-insensitive names**

  File names are not case sensitive on Windows, so MySQL database and table names are also not case sensitive on Windows. The only restriction is that database and table names must be specified using the same case throughout a given statement. See Identifier Case Sensitivity.

- **Directory and file names**

  On Windows, MySQL Server supports only directory and file names that are compatible with the current ANSI code pages. For example, the following Japanese directory name will not work in the Western locale (code page 1252):

  ```
  datadir="C:/私たちのプロジェクトのデータ"
  ```

  The same limitation applies to directory and file names referred to in SQL statements, such as the data file path name in `LOAD DATA INFILE`.

- **The "`\`" path name separator character**

  Path name components in Windows are separated by the "`\`" character, which is also the escape character in MySQL. If you are using `LOAD DATA INFILE` or `SELECT ... INTO OUTFILE`, use Unix-style file names with "`/`" characters:

  ```
  mysql> LOAD DATA INFILE 'C:/tmp/skr.txt' INTO TABLE skr;
  mysql> SELECT * INTO OUTFILE 'C:/tmp/skr.txt' FROM skr;
  ```

  Alternatively, you must double the "`\`" character:

  ```
  mysql> LOAD DATA INFILE 'C:\\tmp\\skr.txt' INTO TABLE skr;
  mysql> SELECT * INTO OUTFILE 'C:\\tmp\\skr.txt' FROM skr;
  ```

- **Problems with pipes**

  Pipes do not work reliably from the Windows command-line prompt. If the pipe includes the character `^Z` / `CHAR(24)`, Windows thinks that it has encountered end-of-file and aborts the program.

  This is mainly a problem when you try to apply a binary log as follows:

  ```
  C:\> mysqlbinlog binary_log_file | mysql --user=root
  ```

  If you have a problem applying the log and suspect that it is because of a `^Z` / `CHAR(24)` character, you can use the following workaround:

  ```
  C:\> mysqlbinlog binary_log_file --result-file=/tmp/bin.sql
  C:\> mysql --user=root --execute "source /tmp/bin.sql"
  ```

  The latter command also can be used to reliably read in any SQL file that may contain binary data.

Known Issues in MySQL

mysqlbug

mysqlbug — Generate Bug Report

mysqlcheck

mysqlcheck — A Table Maintenance Program
ALTER DATABASE Syntax
MyISAM Table Maintenance and Crash Recovery
Checking Whether Tables or Indexes Must Be Rebuilt
my_print_defaults — Display Options from Option Files
mysql_upgrade — Check and Upgrade MySQL Tables
Maintenance of Partitions
Mapping of Identifiers to File Names
Overview of MySQL Programs
Rebuilding or Repairing Tables or Indexes
Restrictions and Limitations on Partitioning
Server System Variables
The MyISAM Storage Engine
Upgrading from MySQL 5.0 to 5.1

mysqld

myisamchk Check Options
myisamchk General Options
mysqld — The MySQL Server
'File' Not Found and Similar Errors
Can't connect to [local] MySQL server
Can't create/write to file
Can't initialize character set
Client does not support authentication protocol
CREATE FUNCTION Syntax for User-Defined Functions
CREATE TABLE Syntax
CREATE VIEW Syntax
FLUSH Syntax
Host 'host_name' is blocked
Ignoring user
InnoDB General Troubleshooting
InnoDB Startup Options and System Variables
INSERT DELAYED Syntax
KILL Syntax
LOAD DATA INFILE Syntax
MyISAM Startup Options
MySQL server has gone away
mysql_affected_rows()
mysql_options()
OPTIMIZE TABLE Syntax
Packet too large
SELECT ... INTO Syntax
SET TRANSACTION Syntax
SHOW ENGINE INNODB STATUS and the InnoDB Monitors
SHOW ENGINE Syntax
SHOW VARIABLES Syntax
Too many connections
Adding a New User-Defined Function
Adding New Functions to MySQL
Adding, Removing, or Resizing InnoDB Data and Log Files
Backing Up and Recovering an InnoDB Database
Binary Log Options and Variables
Binary Logging Formats
Building MySQL Cluster from Source on Linux
Causes of Access-Denied Errors
Choosing a Distribution Format
Commands in the MySQL Cluster Management Client
Comment Syntax
Communication Errors and Aborted Connections
Compiling and Installing User-Defined Functions
Compiling and Linking an Optimized mysqld Server
Compiling MySQL for Debugging
Configuring InnoDB
Configuring MySQL for SSL
Corrupted MyISAM Tables
Creating the InnoDB Tablespace
Creating Trace Files
Dealing with InnoDB Initialization Problems
Dealing with Problems Compiling MySQL
Debugging mysqld under gdb
Debugging a MySQL Server

Options Common to MySQL Cluster Programs — Options Common to MySQL Cluster Programs
ndb_mgmd — The MySQL Cluster Management Server Daemon
ndb_show_tables — Display List of NDB Tables
myisamchk — MyISAM Table-Maintenance Utility
myisampack — Generate Compressed, Read-Only MyISAM Tables
mysqlbinlog — Utility for Processing Binary Log Files
mysqlhotcopy — A Database Backup Program

mysqladmin — Client for Administering a MySQL Server
mysqlcheck — A Table Maintenance Program
mysqldump — A Database Backup Program
resolve_stack_dump — Resolve Numeric Stack Trace Dump to Symbols
comp_err — Compile MySQL Error Message File
mysql_install_db — Initialize MySQL Data Directory
mysql.server — MySQL Server Startup Script
mysqld_multi — Manage Multiple MySQL Servers
mysqld_safe — MySQL Server Startup Script
Environment Variables

ndb_restore — Restore a MySQL Cluster Backup

--skip-use-db
mysql_find_rows — Extract SQL Statements from Files

--skip-write-binlog
mysqlcheck — A Table Maintenance Program
mysql_upgrade — Check and Upgrade MySQL Tables

--skip-xxx
mysqldump — A Database Backup Program

--skip_grant_tables
Using Options on the Command Line

--slave
mysqlslap — Load Emulation Client

--slave-allow-batching
MySQL Cluster Development in MySQL Cluster NDB 6.1

--slave-load-tmpdir
Backing Up Raw Data from a Slave
Database Backup Methods
Replication Slave Options and Variables

slave-max-allowed-packet
Replication Master Options and Variables

--slave-max-allowed-packet
Replication Master Options and Variables

--slave-net-timeout
Replication Slave Options and Variables

--slave-skip-errors
Implementing Failover with MySQL Cluster Replication
Replication Slave Options and Variables
Slave Errors During Replication

--slave_compressed_protocol
Replication Slave Options and Variables

--sleep
`mysqladmin` — Client for Administering a MySQL Server

--slow-query-log
Server Command Options

--slow_query_log
Selecting General Query and Slow Query Log Output Destinations
Server Command Options
Server System Variables
The Slow Query Log

--slow_query_log_file
Running Multiple MySQL Instances on One Machine
Server Command Options
The Slow Query Log

--socket
`mysql` Options
`Can't connect to [local] MySQL server`
Causes of Access-Denied Errors
Connecting to the MySQL Server
`mysql_convert_table_format` — Convert Tables to Use a Given Storage Engine
`mysql_setpermission` — Interactively Set Permissions in Grant Tables
`mysqlbinlog` — Utility for Processing Binary Log Files
`mysqlhotcopy` — A Database Backup Program
`mysqladmin` — Client for Administering a MySQL Server
`mysqlcheck` — A Table Maintenance Program
`mysqldump` — A Database Backup Program
`mysqlimport` — A Data Import Program
`mysqlshow` — Display Database, Table, and Column Information
`mysqlslap` — Load Emulation Client
`mysql_config` — Get Compile Options for Compiling Clients
`mysqld_safe` — MySQL Server Startup Script
How to Protect or Change the MySQL Unix Socket File
Invoking MySQL Programs
Library and Plugin Descriptors
